THE ROYAL HORTICULTURAL SOCIETY: *Spade*. We share your views as to the Association to a certain extent. We think it a very unfortunate arrangement, but one that will die of itself. We altogether demur to your proposition, that any intentional insult to the craft was intended. The Association should in our opinion be an honor without price conferred after examination on deserving candidates. Men of the stamp you name whose brains are at the service of the Society, but whose means preclude their subscribing, should be elected Honorary Members. The Fellows might recommend each year to the Council, a certain number, and a general meeting might confirm the elections or otherwise. The Drill Hall meetings have been avowedly experimental, and can be dropped at the end of the year if thought desirable. Whether the public, or even the members of committees, would go to Chiswick fortnightly, is extremely doubtful. It is true they went in numbers to the Apple Congress, and we hope they will do so again.

TOMATO: *L. B. G.* One of the diseases caused by fungi. See p. 44 for full details.—*R. T.* Although, botanically speaking, this is a fruit, it is used as table as a vegetable or a salad. On the ground, therefore, that schedules are drawn up from the point of view of practical horticulture, and not of botany, we should, in the absence of any provision to the contrary, disqualify a collection of fruit containing Tomatos.

TOMATO SAUCE: *C. S.* For present use: Take a dozen ripe Tomatos and press the seeds and juice from them. Place them in a stepwan with a quarter of a pint of stock and a pinch of cayenne. Let them stew slowly until they are quite soft, then press them through a fine sieve, and put the pulp back into the stepwan with a little salt. Let it simmer for a few minutes, and serve very hot, and about the thickness of cream. If liked, a blade of mace, two or three shallots, and two or three cloves, may be stewed with the Tomatos, but most lovers of Tomatos prefer that they should retain their natural piquancy and flavour, which is masked if too many ingredients are added to the sauce. If to be stored, put the Tomatos into an earthen jar in a cool oven. When they are quite soft, separate the pulp from the skins. Mix with this, and half the juice that flowed from the Tomatos while baking, the following ingredients:—To each dozen of Tomatos a dessert spoonful of salt, a dessert spoonful of powdered ginger, a pinch of cayenne, and two table-spoonfuls of vinegar. Boil all up together, put the sauce into perfectly dry, wide-mouthed bottles, and store it in a cool dry

place. It must be frequently examined to ascertain if it is in good condition. If it looks watery and thin, turn it out of the bottles and boil it up again, with a little more cayenne and ginger. Some cooks add a *souppon* of garlic, but we do not recommend it. Tomato sauce is difficult to make so that it will keep long. To ensure this, so much spice and artificial flavouring must be added that the Tomatos are apt to lose their natural flavour. Store in moderate-sized bottles, as the sauce will not keep when once the bottle has been opened.

VINE DISEASES: *Amateur*, *Grosveil*, *Quill Pen*. All cases of "so-called scalding." See reply to correspondents last week.

COMMUNICATIONS RECEIVED.—*E. C. J.*, *R. H. W. W.*, *F. W. B.*, *W. D. E.*, *C. C.*, *O. W.*, *W. H. C.*, *Genava*, *F. T.*, *Sydney*, *J. C.* & *Co.*, *J. W. W.*, *M. J. W.*, *Natal*, *W. S. H. Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their queries in the current week.

## MARKETS.

COVENT GARDEN, August 16.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend very much on the quality of the sample, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

MARKET lighter, with business falling off, the soft fruit being nearly finished. Prices unaltered. *James Webber, Wholesale Apple Market.*

## SEEDS.

LONDON: August 15.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., describe to-day's market as exceedingly firm. The article still most in favour is white Clover seed, in which a further rise is noted. Alsike and Trefoil also tend upwards. New English Trifolium is offering at moderate rates. Samples of new winter Tares and Rye are now coming to market. Lower prices are taken for Canary seed. There is no change in Hemp seed. Blue Peas keep steady. In sowing Mustard and Rapeseed there is no quotable alteration. Feeding Linseed is firm.

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended August 11:—Wheat, 34s. 6d.; Barley, 24s. 9d.; Oats, 18s. For the corresponding week in 1887:—Wheat, 33s. 3d.; Barley, 20s. 7d.; Oats, 16s. 10d.

## FRUIT AND VEGETABLES.

SPITALFIELDS: August 15.—Plentiful supplies of all kinds of fruit, farm and market garden produce; the demand, however, rather slow. Quotations:—Fruit: Green Gages, 4s. to 5s. per half-bushel; Cherries, 2s. 6d. to 5s. 6d. per half sieve; Strawberries, 3d. to 6d. per pound punnet; black Currants, 2s. 3d. to 3s. per half sieve; red Currants 2s. to 2s. 3d. do.; white Currants, 2s. 6d. to 3s. 2s. do.; Gooseberries, 2s. to 3s. do.; Plums, English, 3s. 6d. to 4d. per half-flat or basket; foreign do., 2s. to 3s. do.; Pears, 2s. to 3s. per half-bushel; Apples, 2s. 6d. to 3s. 6d. do.; English Tomatos, 4s. to 6s. per peck; foreign do., 2s. to 3s. 6d. per box. Vegetables: Cabbages, 1s. 3d. to 2s. per tally; Scarlet Runners, 4s. per bushel; Broad Beans, 1s. to 1s. 6d. do.; Peas, 1s. 6d. to 2s. do.; do., 3s. to 4s. 6d. per sack; Vegetable Marrows, 6d. to 6d. per dozen; frame Cucumbers, 3s. to 4s. 6d. per dozen; common do., 1s. to 2s. do.; Turnips, 1s. 6d. to 2s. 6d. per dozen bunches; Carrots, 1s. to 2s. do.; spring Onions, 1s. 3d. to 2s. do.; Parsley, 9d. to 1s. 3d. do.; Mint, 1s. to 1s. 6d. do.; foreign Onions, 6s. to 7s. per sack; do., 4s. to 5s. per bag; Cos Lettuces, 6d. per score; Endive, 1s. to 1s. 6d. per doz.; Walnuts (for pickling), 1s. 6d. to 2s. per half sieve; Mangels, 15s. to 20s. per ton.

STRATFORD: August 14.—Supply has been good during the past week, and a fair trade was done at the following prices. Quotations:—Cabbages, 2s. 10d. to 3s. per tally; Apples, English, 5s. to 6s. 6d. per bushel; ditto Bordeaux, 7s. to 8s. per case; Gooseberries, 2s. 6d. to 3s. per half sieve; Currants, black, 3s. to 3s. 6d. do.; red, 2s. 6d. do.; Dutch Plums, 3s. to 3s. 6d.; Pears, 2s. to 3s. 3d. do.; Tomatos, 1s. to 3s. per box; Green Gages, 3s. to 3s. 3d. per flat.

## POTATOS.

BOROUGH AND SPITALFIELDS: August 14.—The blight continues to interrupt the trade, which is extremely dull and irregular; lower prices in many cases taken, but not shown in the extreme quotations. Regents, 65s. to 75s.; Shaws, 60s. to 70s.; Hebrons, 70s. to 84s.; kidneys, 70s. to 80s. per ton.

SPITALFIELDS: August 15.—Quotations:—Beauty of Hebron, 2s. to 2s. 6d.; Early Rose, 1s. 6d. to 2s. 6d.; English Regents, 2s. to 3s. 6d.; do., kidneys, 3s. to 4s.; Jersey do., 3s. to 4s.; do., Shaws, 3s. 6d. to 4s. 6d.; Cherbourg flukes, 3s. to 4s. per cwt.

STRATFORD: August 14.—Quotations:—Myatt's, 55s. to 80s.; Beauty of Hebron, 40s. to 70s.; Early Rose, 35s. to 50s. and Regents, 60s. to 70s. per ton.

## HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 98s. to 137s.; inferior, 76s. to 86s.; hay, prime, 94s. to 130s.; inferior, 78s. to 84s.; and straw, 26s. to 48s. per load.

**BEESON'S MANURE.**—The Best and Cheapest Fertiliser for all purposes. Write for Circular containing the Leading Gardeners' and Market Growers' Reports. Sold in Tins, 1s., 2s., 6d., 5s., 6d., and 10s. 6d. each, or 1 cwt. Bags, sealed, 15s. By all Seedsmen, or apply direct to W. H. BEESON, Carbrook Bone Mills, Sheffield.

### Estate Sales.

The best County medium for Advertising Sales of Estates is

**THE WORCESTER HERALD**, the largest and leading County paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution, plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the *Worcester Herald*. Specimen copies sent free. Published Friday for Saturday, price 2d.  
Offices, 72, High Street, Worcester.

### Sales of Stock and Agricultural Effects.

**THE WORCESTER HERALD** is the most effective organ for giving publicity to announcements of this class. It is the largest and leading Agricultural paper in the county, and circulates most extensively among Agriculturists in and around Worcester. Specimen copies free. Published Friday for Saturday, price 2d.  
Offices, 72, High Street, Worcester.

### Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms to Let, would do well to advertise in

**WANTED**, at once, ROSE BUDDER, for the Season.—State all particulars, C. M. LINDSAY, Chase Warren, Southgate.

**WANTED**, Three or Four good smart ROSE BUDDERS, for a few weeks.—State wages required to WM. RUMSEY, Joining's Nurseries, Waltham Cross, N.

**WANTED**, a MAN for the Pleasure Grounds; one who can Mow well. Wages 18s., and lodgings.—C. GOLDSMITH, Kelsey Manor Gardens, Beckenham.

**TRAVELLER**.—A Nurseryman having a large stock of select Hard Shrubs, Fruit Trees, &c., &c. (in the finest possible condition), is open to negotiate with a good TRAVELLING SALESMAN (on Commission only). He will be allowed to Sell Cheaply.—Terms with proofs of ability and trustworthiness, to C. N. B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C. No objection to his engaging in other business not horticultural.

**WANTED**, a SHOPMAN, with a thorough knowledge of Seeds, Plants, and Bulbs. Must be of good address, energetic, and methodical. Wages to commence at 28s. per week.—Apply, giving full particulars, to J. R. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED**, for a young but rapidly-growing Seed and Florist's Business, in Scotland, a thoroughly efficient SHOPMAN well versed in Vegetable and Flower Seeds, Bulbs, &c., and having a knowledge of Plants and Flowers. Must have at least ten years' experience and be thoroughly recommended as accurate, energetic, and trustworthy in every respect.—Apply, giving full particulars of training, age, wages, &c., CANDOR, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED**, a young Man, as COUNTER ASSISTANT, who has served a few years in a good house.—Must be industrious, and of good address.—Applications, stating wages expected, &c., to J. W. M., 23, Upper Saville Street, Dublin.

**WANTED**, a PORTER. Smart young Man, accustomed to Bulb Trade.—SMALL AND CO., 23, Lime Street, E.C.

## WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Address, and also a Reference to the Advertisement which they wish repeated.

### Gardeners, Farm-Bailiffs, Foresters, &c.

**DICKSONS (Limited)** are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address "DICKSONS, CHESTER."

**TO FLORISTS.**—Wanted, by a Nurseryman's Daughter (age 19), an engagement in the above business.—Address full particulars to H. The Pines, Mount Pleasant, Aspley Guise, Woburn.

**HOLLOWAY'S OINTMENT and PILLS.**—Rheumatism and Rheumatic Gout are the most dreaded of all diseases, because their victims know that they are safe at no season, and at no age secure. Holloway's Ointment, after formation of the painful parts, gives greater relief than any other application; but it must be diligently used to obtain this desirable result. It has been highly commended by rheumatic subjects of all ages and of both sexes, for rendering their attacks less frequent and less vigorous, and for repressing the sore perspirations and soothing the nerves. In many cases Holloway's Ointment and Pills have proved the greatest blessing in removing rheumatic gout, which has assailed persons previously and at the prime of life.

## MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

## Sales by Auction continued.

## Enfield Highway, N.

The Brimsdown Nursery, adjoining Brimsdown Station, Great Eastern Railway.

## TWENTIETH ANNUAL TRADE SALE.

**MESSRS. PROTHORPE AND MORRIS** are instructed by Mr. John Maller to **SELL BY AUCTION**, on the Premises, The Brimsdown Nursery, Enfield Highway, N., on **THURSDAY, September 20**, at 11 o'clock precisely, in consequence of the unusually large number of lots, without Reserve, upwards of 1200 lots of remarkably well-grown **STOVE and GREENHOUSE PLANTS**, mostly in 48-pots, and fit for immediate Sale, consisting of—

15,000 winter-blooming Heaths, including <i>hyemalis</i> , <i>gracilis</i> , <i>Castra</i> , <i>Wilmores</i> , &c., and extra large <i>E. Cavendishii</i>	1,000 double white <i>Primulas</i>
5,000 <i>Solanums</i> , exceptionally well grown	1,000 <i>Stove</i> and <i>Greenhouse Climbers</i>
5,000 <i>Ferns</i> , <i>Adiantums</i> , <i>Pteris</i> , &c.	200 <i>Diplanensis</i> of sorts
3,000 <i>Tree Carnations</i> , leading varieties	100 <i>Alamandae</i>

Many thousands of small *Ericas*, *Genistas*, *Ferns*, &c.; large quantities of *Acacias*, *Gardenias*, *Euphorbia*, *Jacquinthas*, *Chrysanthemums*, *Poinsettias*, *Euonymus ovatus aureus*, in stores, &c., suitable for the Trade, and other extensive buyers. May be seen any day prior to the Sale. Catalogues may be had on the Premises, or at the Brunswick Nursery, Tottenham; and of the Auctioneers, 67 and 68, Cheapside, London, E.C., and Leytonstone, E.

N.B.—The Auctioneers desire to call the attention of intending purchasers to this **GREAT ANNUAL TRADE SALE**, which has hitherto taken place at the Brunswick Nursery, Tottenham; but, in consequence of the Lease of that Nursery having nearly expired, the Sale this year, and to future, will take place as above, adjoining the Brimsdown Station, G.E.R. The whole of the Stock is in first-rate condition, the *Ericas* being especially well set for flower, and the *Solanums* unusually well carried. **TRADE SALE** will be held on **SALE at the BRUNSWICK NURSERY, Tottenham, on THURSDAY, September 27**, of which a separate Advertisement will appear.

## Cheap Bulb Sales.

**MESSRS. SMALL AND CO.** will **SELL BY AUCTION**, at 123, Fenchurch Street, City, E.C., on **TUESDAY, THURSDAY, and SATURDAY NEXT**, August 28, 29, and September 1, at 12 o'clock each day, large Consignments of First-class **HYACINTHS, TULIPS, CROCUS**, and other **DUTCH BULBS**, specially lotted to suit all Buyers.

Addresses of intending Purchasers Booked for Catalogues of these Weekly Sales.

## To Nurserymen, Florists, and Others.

SEARLE, HALTON, and BOWYER**, will **SELL BY AUCTION**, upon the Premises, Town Road Nursery, Edmonton, on **THURSDAY, August 30, 1888**, at 2 o'clock precisely, in 250 Lots, without reserve—the Lease, 12 years unexpired, at the low rent of 25s.—comprising good **DWELLING-HOUSE, STABLES, and COACH-HOUSE**, and 1 Acre of **GROUND** also the erected of 14 Green-houses, with their Boilers, Piping, Brickwork, Doors, Stazing, Sash-bars, and other Joiner's work, and 21-oz. Glazing, Potting-loam, Flower pots, Pit-lights, Heavy and Light Spring Carts, Covered Van, cart of Hay, 4000 Maidenhair Ferns, 600 Ivy Plants, small crop of Wurzels, &c.

On view morning of Sale. Catalogue of the Auctioneers, Tottenham.

**WANTED TO RENT**, an Acre or Two of LAND, with 300 or 400 feet of Grass and Dwelling-House.

**FLORIST, Gardeners' Chronicle Office**, 41, Wellington Street, Strand, W.C.

**To Grape, Fruit, Tomato Growers, Market Gardeners, &c.**

**TO BE DISPOSED OF**, an Old-established BUSINESS in the Channel Islands, in full work.

Apply in the first instance by letter, addressed to A. R. C. H., Bedford Villa, Teddington. Principals only treated with.

## To Gardeners and Florists.

**TO BE SOLD**, 5 Acres of **FREEHOLD LAND**, for erection of Glasshouses or for Gardening purposes; also some Smaller Allotments. Payment by instalments, if required.

Particulars of **BENNINGFIELD and TIDY, Ware, Herts**; 16, Union Court, Old Broad Street, London, E.C.

**FOR SALE**, or to be **LET**, a **NURSERY**, 2 Acres of Ground, several Glasshouses, and a comfortable little House. Between Putney and Wandsworth.

Apply to Mr. FRED W. GLAZIER, 1, Park Side, Hyde Park Corner, W.

**TO BE LET**, a compact **NURSERY**, 9000 feet of Glass, recently erected and thoroughly heated, together with Dwelling-house, Stables, Outbuildings and Retail Shop. The whole centrally situated in fashionable watering place. Goodwill full. Part or whole stock at valuation.

A. E. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

## To Nurserymen, Florists, and Others.

**TO BE LET**, in Plots, splendid LAND, near North London Station, Great Eastern Railway, close to old main line, for erecting Greenhouses and Dwelling House would be erected for suitable tenants. Moderate rent.

Apply to Mr. ALFRED RICHARDS, Estate Agent, Tottenham.

**Sandy, Bedfordshire.**  
About 10 minutes' walk of the Great Northern and London and North-Western Railways.

**TO BE LET**, with immediate possession, a small **DWELLING-HOUSE** with Yard, Stabling, Onion Loft, a span-roof Greenhouse or Vinery, 30 feet by 15 feet; Lean-to Pits adjoining, 45 feet by 6 feet; Lean-to Glasshouse, 15 ft. by 9 ft. 6 in.; span-roof Pits adjoining, 33 feet by 9 feet, with Nursery Ground. Total area, 2 roods 30 perches. For further particulars, apply to Mr. GEORGE JACKSON, Auctioneer, Hitchin, Herts.

**TO LET**, at Syston, from November next, 4 Acres of **GARDEN**, planted with Fruit Trees; five Greenhouses fitted with Hot-water; Grass Field, and good House and Buildings.

Apply to R. DEYAN, White Swan, Syston, Leicester.

**TO BE LET**, an old-established **MARKET NURSERY**, well stocked, at a valuation; about 1 acre. Rent moderate. For particulars, apply to Mr. GEORGE JACKSON, Auctioneer, Hitchin, Herts.

R. B., 28, Colenso Road, Clapton Park, E.

# NOTICE

TO THE

## HORTICULTURAL TRADE.

HAVING for some years past, owing to the particular nature of my business as a Horticultural Agent, recognised to the fullest extent the absolute importance of securing speedy transit and quick delivery, in the case of all plants sent from the Continent to England and *vice versa*; and having myself suffered great inconvenience, annoyance, and loss from causes which could easily have been avoided, had the shippers entrusted with plants possessed any practical knowledge of their nature and requirements, I beg to inform you that, my business with the Continent having become so extensive, I am now obliged, in self defence, to take up the business of a

### SHIPPING AND FORWARDING AGENT.

I am so well aware of the serious consequences of a few hours frost in the case of plants left on the wharf for a night—as frequently happens—and which by a little care in warehousing can be easily avoided, to the great benefit of sender and buyer, that I have determined in future to give all such details my closest personal attention, and beg you to recognise the advantages which will thus be gained by your shipping all your consignments to this country through me.

I have secured admirable premises for this branch of my business at 12, Cooper's Row, Crutched Friars, London, E.C., and with the available accommodation at the various wharves for the proper and prompt warehousing of the most tender plants, am in a position to assure you that I possess every facility for conducting the business in a manner that I am sure will give satisfaction to those who may favour me with their patronage and support.

**WILLIAM DENMAN,**

SATURDAY, AUGUST 25, 1888.

### THE BOARD OF AGRICULTURE.

THE *Times* of the 21st inst. published the text of the Ministerial Bill for establishing a Board of Agriculture, which was read a first time just before Parliament adjourned. Our great concern in this Bill is due to the fact that in this Act "the expression 'agriculture' includes horticulture and forestry." This recognition of the importance of horticulture as a national industry is, we believe, due to the well-timed interposition of the Royal Horticultural Society, through its President, Sir Trevor Lawrence. In any case, an excellent opportunity is now offered for the Society to follow up the matter, and bring home to the public and the Government the fact, that horticulture has claims on their estimation comparable only with those of agriculture itself. Moreover, that the prosperity of agriculture in the future depends, so far as the rearing of crops is concerned, on the inculcation of the scientific principles, and on the adoption of the practical methods which render horticulture a progressive art, able to confront new conditions as they arise. Horticulturists can benefit the State very materially, and although the State of itself, unsupported by public opinion, can do little good, and may do harm, yet it is certain that if practically worked, and not fettered and cramped with officialism and red tape, the Board of Agriculture may stimulate and encourage progress. But the first thing is to get the public to look on horticulture as something more than recreation—something beyond a means of supplying the luxuries of the rich. Our readers do not need to be told that horticulture is beneficial in other ways than those named, and they will not dissent from our statement that our power for good is incalculable. To enable us to do this we require a wider general scheme of instruction in the principles and in the technicalities of our art; we stand in need of laboratories and experimental gardens; we want competent instructors to visit our villages and gardens; we demand a much more comprehensive sense of duty and a more active propaganda on the

part of our horticultural societies; but we need say no more on these heads at present. It must suffice now to cite those portions of the proposed Bill which are of main import, and to solicit the comments of our readers, so that, when the time comes, the Bill may be amended in those parts where amendment is desirable:—

"1.—(1). There shall be established a Board of Agriculture consisting of the Lord President of the Council, Her Majesty's principal Secretaries of State, the First Commissioner of Her Majesty's Treasury, the Chancellor of Her Majesty's Exchequer, the Chancellor of the Duchy of Lancaster, and the Secretary for Scotland. It shall be lawful for Her Majesty the Queen from time to time to appoint any member of the Privy Council to be President of the Board during Her Majesty's pleasure, and if he is not one of the above officers of State he shall be a member of the Board.

"2.—(1) There shall be transferred to the Board of Agriculture—(a) The powers and duties of the Privy Council under the Acts mentioned in Part I. of the first schedule to this Act; (b) the powers and duties of the Land Commissioners for England under the Acts mentioned in Part II. of the first schedule to this Act, or under any other Act; (c) all powers and duties vested in the Commissioners of Her Majesty's Works and Public Buildings under the Survey Act, 1870.

"(2) The Board of Agriculture shall also undertake the collection and preparation of statistics relating to agriculture, the inspection of, and reporting on, any schools which are not public elementary schools, and in which technical instruction, practical or scientific, is given in any matter connected with agriculture, and in aiding any school which admits such inspection, and in the judgment of the Board is qualified to receive such aid.

"(3) The Board of Agriculture may also make, or aid in making, such inquiries and experiments, and collect or aid in collecting such information as they may think important for the purpose of promoting the advancement of agriculture.

"3. It shall be lawful for Her Majesty the Queen in council from time to time by order to transfer to the Board of Agriculture such powers and duties of any Government department as are conferred by or in pursuance of any statute, and appear to Her Majesty to relate to agriculture, and to be of an administrative character.

"(2) There shall be paid out of money provided by Parliament to the President, if not one of the officers of State above mentioned, or any other officer of State receiving a salary, the annual salary of £2000 a year, and to the secretary, officers, and servants of the Board such salaries or remuneration as the Treasury may from time to time determine.

"(3) All expenses incurred by the Board of Agriculture in the execution of their duties under this Act, to such amount as may be sanctioned by the Treasury, shall be paid out of money provided by Parliament.

"7.—(1) The office of President of the Board of Agriculture shall not render the person holding the same incapable of being elected to or sitting or voting as a member of the Commons House of Parliament, and shall be deemed to be an office included in schedule H of the Representation of the People Act, 1867, schedule H of the Representation of the People (Scotland) Act, 1868, and schedule E of the Representation of the People (Ireland) Act, 1868.

"8.—(1) There shall be transferred and attached to the Board of Agriculture such of the persons employed under the Privy Council or any other Government department, in or about the execution of the powers and duties by this Act transferred to the Board of Agriculture, as the Privy Council, or Government department, with the sanction of the Treasury, determine.

"(2) There shall be transferred and attached to the Board of Agriculture all persons employed under the Land Commissioners for England.

"(3) The Board of Agriculture may by order from time to time distribute the business of the Board among the several persons transferred thereto in pursuance of this Act in such manner as the Board may think right, and those officers shall perform such duties in relation to that business as may be directed by the order.

"Provided that such persons shall, while they continue in office, be in no worse position as respects

their tenure of office, salaries, or superannuation allowances, than they would have been in if this Act had not passed.

"(4) In the event of a transfer of any powers or duties to the Board of Agriculture being made by Order in Council in pursuance of this Act, such order shall extend this section to the persons employed in or about the execution of the powers and duties so transferred, but nevertheless with such modifications as to Her Majesty in Council seem necessary.

"9. After the establishment of the Board of Agriculture no person shall be appointed to the Office of Land Commissioner for England.

"Provided that any person who holds office as Land Commissioner at the passing of this Act may be assigned such position in or under the Board of Agriculture as the Board may appoint, so that he is not placed in any worse position as respects his tenure of office, salary, or superannuation allowance than he would have been in if this Act had not passed.

"11. In this Act the expression 'agriculture' includes horticulture and forestry.

"13. This Act may be cited as the Board of Agriculture Act, 1888.

#### "FIRST SCHEDULE.

"Part I.—Acts relating to Powers and Duties of the Privy Council transferred to Board of Agriculture.

40 and 41 Vict. c. 68, the Destructive Insects Act, 1877; 41 and 42 Vict. c. 74, the Contagious Diseases (Animals) Act, 1878; 47 and 48 Vict. c. 13, the Contagious Diseases (Animals) Act, 1884; 47 and 48 Vict. c. 47, the Contagious Diseases (Animals) Transfer of Parts of Districts Act, 1884; 49 and 50 Vict. c. 32, the Contagious Diseases (Animals) Act, 1886.

"Copyhold Acts.—4 and 5 Vict. c. 35, the Copyhold Act, 1841; 6 and 7 Vict. c. 23, the Copyhold Act, 1843; 7 and 8 Vict. c. 55, the Copyhold Act, 1844; 15 and 16 Vict. c. 51, the Copyhold Act, 1852; 21 and 22 Vict. c. 94, the Copyhold Act, 1858; 31 and 32 Vict. c. 89, an Act to alter certain provisions in the Acts for the commutation of tithes, the Copyhold Acts, and the Acts for the inclosure, exchange, and improvement of land; and to make provision towards defraying the expenses of the Copyhold, Inclosure, and Tithe Office; 50 and 51 Vict. c. 73, the Copyhold Act, 1887.

"Metropolitan Commons.—29 and 30 Vict. c. 122, the Metropolitan Commons Act, 1866; 32 and 33 Vict. c. 107, the Metropolitan Commons Amendment Act, 1869; 41 and 42 Vict. c. 71, the Metropolitan Commons Act, 1878; 45 and 46 Vict. c. 15, the Commonable Rights Compensation Act, 1882.

"Other Duties.—14 and 15 Vict. c. 53, the Inclosure Commissioners Act, 1851; 15 and 16 Vict. c. 62, an Act to alter and amend certain Acts relating to the woods, forests, and land revenues of the Crown; 29 and 30 Vict. c. 70, an Act to extend the provisions of the Acts for the inclosure, exchange, and improvement of land to certain portions of the Forest of Dean called Walmore Common and the Bearce Common, and for authorising allotments in lieu of the forestal rights of Her Majesty in and over such commons; the Poor Allotments Management Act, 1873; 44 and 45 Vict. c. 41, the Conveyancing and Law Property Act, 1881; 45 and 46 Vict. c. 15, the Commonable Rights Compensation Act, 1882; 45 and 46 Vict. c. 38, the Settled Land Act, 1882; 46 and 47 Vict. c. 61, the Agricultural Holdings (England) Act, 1883; 47 and 48 Vict. c. 67, the Improvement of Lands (Ecclesiastical Benefices) Act, 1884.

#### "SECOND SCHEDULE.

"Enactments Repealed.—6 and 7 Will. IV., c. 71, an Act for the Commutation of Tithes in England and Wales, section 2; 4 and 5 Vict. c. 35, the Copyhold Act, 1841, sections 1, 2, 4, 5, 7, 8, and 9; 8 and 9 Vict. c. 118, the Inclosure Act, 1845, sections 2, 6, and 8; 14 and 15 Vict. c. 53, the Inclosure Commissioners Act, 1851, the whole Act, except section 9; 25 and 26 Vict. c. 73, an Act for continuing the Copyhold Inclosure and Tithe Commission, and entitling the Commissioners to Superannuation Allowance, the whole Act so far as unrepealed; 40 and 41 Vict. c. 68, the Destructive Insects Act, 1877, section 6; 41 and 42 Vict. c. 74, the Contagious Diseases (Animals) Act, 1878, subsection 2 of section 8, and subsection 6 of section 58; 45 and 46 Vict. c. 38, the Settled Land Act, 1882, section 48 down to 'may require of the three several bodies of Commissioners aforesaid,' being the end of subsection 5 inclusive."

## NEW OR NOTEWORTHY PLANTS.

### SACCOLABIUM CERINUM, n. sp.\*

THIS was exhibited at the last Ghent show. Though it is no fashionable Orchid it attracted a good deal of interest, as the rather dark ligulate bilobed leaves and the perfect inflorescence of numerous ascending waxy flowers, orange, with an apricot colour spur, excited the curiosity, and numerous visitors were not quite sure, *cujus generis*, the curiosity might be. It is a Sondaie introduction made by Mr. F. Sander. It was exhibited by Mr. James Bray, Rue Courte des Pierres, Gand. H. G. Rehb. f.

### BOLLEA HEMIXANTHA, n. sp.†

This is very near *Bollea Lalindei*. It has a similar large flower. Colour quite distinct. Sepals and petals white. Lip yellow, with thirteen parallel darker yellow keels forming a mighty crest and numerous small warts and styloid processes at the base. This is quite a novel and peculiar feature of the plant. The white column is much dilated at the base, with yellow basilar angles, the yellow base being covered with minute dark red spots. It was kindly forwarded me by Mr. F. Sander, who had it from New Grenada (United States of Columbia, if you like it better). H. G. Rehb. f.

## ROSES.

### NEW ROSES IN 1888.

ONE of the great disappointments connected with this very abnormal season has been that an opportunity has been missed of seeing, as we had hoped to do, the new and semi-new Roses in larger quantities than we have done. By new Roses I mean those which have only recently been put into commerce; and by semi-new those which have been in the market for a year or two. It was the more disappointing, as several of these claimants for favour are from new sources, and we all looked forward, in the case of some of them, to see them largely exhibited by their raisers; but this was not to be—the lateness of the season, and its stormy, rainy character hindered that, and many of them were only sparingly exhibited. I was, however, enabled to grow many of these in my own garden, and thus to notice their character—which is, after all, the most satisfactory plan, as one can compare wood, foliage, and habit of growth with those Roses which are supposed to bear some likeness to them.

There are two of our home-raised Roses which have established themselves in the opinion of all who have seen them as first-rate novelties—Sir Rowland Hill and Earl of Dufferin—and these I must note first.

*Sir Rowland Hill*, raised by Mack & Son, of Catterick—was exhibited by them at Edinburgh, where it obtained the Gold Medal of the National Rose Society, and also the unanimous approval of all Rose growers who saw it, as a first-class novelty—has, if possible, risen in estimation. It is a Rose of a most beautiful and novel

\* *Saccolabium cerinum*, n. sp.—Aff. *Saccolabium compressum*, Lindl. Caulis valido brevis; foliis ligulatis ovato bilobis; pedunculo porrecto bivaginato, apice deflexo; racemis densifloris ascenduntibus; bracteis linearibus acutis ovaria pedicellata subaequantibus; sepalis oblongis; lateralibus nunc subcurvatis; tepalis ovatis per lineam medianam incrassatis; labello calceolaris excavato, tridentato; dentibus lateralibus retusius anticis, angulatis, dente medio convexo apiculatis; calcaris compresso cylindrico ovato ovarium pedicellatum subaequantibus; anthera rostrata, vertice apiculata; caudicula genuflexa. Ex Sonda insulis imp. H. G. Rehb. f.

† *Bollea hemixantha*, n. sp.—Aff. *Bollea Lalindei*, Rehb. f.; labello ima basi ante ungulam callis parvis numerosis styloideis sine vermiciformibus obusis, carinis contiguis lamellosis dorso obtusiusculis ad 13. lamina a basi cordata triangulari, inverse replicata saccata; columna apice angustiori infra angulum dilatata, basi leviter. Sepala ac tepala alba. Labello durum carinis obscurioribus. Columna alba, basi utrinque ac infra cum ungue flava punctis numerosis in basi—Zygopetalum hemixanthum. Ex nov. Grana. et imp. exc. Sander. H. G. Rehb. f.

colour—a deep claret, flushed with bright scarlet, recalling to some persons' minds an old Rose, *La-charme's Souvenir de Dr. Jamain*, but the colour is far beyond that, while in size and substance of petal it is superior, being stout and well formed. When dying off it becomes almost black, and like all Roses of these dark colours requires protection from the sun's rays (when they do shine!). The plant is of vigorous growth, and altogether it is a very great gain both to Rose growers and Rose exhibitors.

*Earl of Dufferin*.—This Irish Rose, raised by Messrs. A. Dickson & Son, of Newtownards, Co. Down, is a most beautiful high-coloured Rose, of strong constitution and vigorous habit; the flowers are of a brilliant rich crimson colour, with a high pointed centre, the outer petals somewhat recurving, and the brilliant tints of brownish-crimson are seen to great advantage. Last year a good deal of criticism was evoked by a statement in the *Gardeners' Chronicle*, from Scotland, that it was identical with *Prosper Langier*. This was indignantly denied, and the denial was correct; the two Roses are perfectly distinct, and although the French Rose is a good one, it is not to be compared for a moment with *Earl of Dufferin* either in the colour or shape of the flower; others have called it a dark Maurice Bernardin, and others a better Pierre Notting; but I think we may safely say that it is a perfectly distinct Rose, of very superior qualities, likely to be a universal favourite, and to reflect great credit on its raiser.

*Lady Helen Stewart*, by the same raiser, is a flower that, had it not been for the preceding Rose being sent out at the same time, would have, perhaps, attracted more attention. It is a very bright red Rose, of good habit, and very free flowering; it has not often been exhibited, but I was pleased with it in my own garden.

*Duchess of Leeds* (Mack & Son).—A very pretty Rose, which may be described as a pink *La France*, with a dash of *Marie Finger* in it. I question if it will be an exhibition Rose, as it lacks size; but as a garden Rose allowed to grow at will, it will be most valuable, especially for cutting. Sprays of it will do very well for baskets of Roses, as its exceedingly bright and lively colour will lighten up other flowers.

*Mrs. John Laing*.—One of Mr. Bennett's seedlings. The colour is a beautiful soft pink. The flower is large in size and good in form, very free, and a good autumnal bloomer. Although full it is not so liable to spoil as *Her Majesty*, and has been on several occasions shown well and attracted much attention. The award of the National Rose Society's Gold Medal when it was exhibited as a seedling seems to have been fully justified.

*Madame Joseph Desbois*.—This Rose was sent out as a hybrid Tea—a fashion which the French raisers seem to have adopted; if they do it with the idea that a Rose so described is likely to find more favour with us, I think they are grievously mistaken. As a rule, such Roses are regarded with suspicion.

*Grand Mogul*.—I have not seen more than one or two blooms of this Rose exhibited; those that I saw were good in form, brilliant crimson shaded with dark maroon-crimson. As I have not grown it myself I can only say that, as I saw it, it was a brilliant Rose; those who have grown it tell me that in growth and bloom it bears a strong resemblance to *Jean Souper*, both in growth and flower.

*Miss Ethel Brownlow*.—A Tea Rose raised by Messrs. Dickson & Son, the raisers of *Earl of Dufferin*; very distinct in colour, salmon-pink, shaded with yellow at the base of the petals, the centre high, and outer petals somewhat reflexed. Of vigorous growth, likely to be an acquisition owing to its distinct character.

*Luciola*.—A Tea Rose raised by J. Guillot, and one that will apparently uphold his good reputation as a raiser. The bud is long and pointed—the true Tea bud; the colour a bright carmine-red, but with some of those extraordinary combinations of colours which make the Tea Roses so ravishing—fawn, copper colour, bronzy-red, are all mixed together, or rather placed to-

gether in the flower without being mixed, blending with one another, and constituting a strikingly beautiful flower.

*Lady Alice*.—This is a sport from the well known *Lady Mary Fitzwilliam*, and at times distinct from it; the colour is creamy-white with a faint yellowish tint at the base; in cooler weather it has more colour.

Looking a little further back we come to some Roses which have been well shown this year or from some other cause are worthy of more extended cultivation.

*Gloire Lyonnaise*.—It was unfortunate that this Rose should have been brought out as a yellow hybrid perpetual; this it certainly is not—it is a white Rose with a very faint suspicion of primrose at the base of the flower, and as a garden Rose will be, I think, much appreciated. It is one of those light Roses which will stand a good deal of rain without being damaged by it, and for such a purpose it may be safely recommended. It is evidently a perpetual, with a good dash of Tea blood in it.

*Victor Hugo*.—This has established itself as a very fine dark Rose, bright crimson-red, shaded with darker colour, perhaps in ordinary seasons it may not be so dark as during the past cold season, when such Roses as *Prince Arthur* and *General Jacquemin* came out in colours that made them hardly recognisable.

*Marshall P. Wilder*.—To all intents and purposes this is a reproduction of *Alfred Colomb*, whether obtained as a seedling or from a vigorous shoot I do not know. When shown this year, attempts were made by some to show its difference from the older flower, but I believe the general opinion is that it must be bracketed with *Alfred Colomb*.

*American Beauty*.—Notwithstanding the somewhat effusive praises bestowed in some of the catalogues on this flower, it was nowhere to be seen this year, and it was generally considered to be but a synonym for *Madame Ferdinand Jamain*, a Rose sent out by *Ledechaux* more than ten years ago, and of so indifferent a character that it never found a place in our catalogues.

*Lord Bacon*.—This has been well exhibited this year, and is one of those deep crimson Roses which are ever acceptable; it is shaded with scarlet, and is a very beautiful flower.

*Madame Sussane Rodocnachi*.—An exceedingly pretty Rose, with light silvery-white shading; very distinct, and has been done well even in this wet season.

*Comtesse de Fregeneuse*.—A very pretty Tea-scented Rose, bright primrose-yellow; very free flowering and good.

*Souvenir de Gabriel Drevet*.—Silver-white with bright rose centre, and oftentimes a mixture of colours hard to describe; it is of good size, and a valuable addition to our lists.

*Pride of Reigate*.—In my opinion simply an abomination. One might as well admire a fair face pitted with small-pox as this spotted thing, which neither on the exhibition table nor in the garden can do anything but spoil its surroundings.

*Vicomtesse Folkestone* is an exceedingly pretty hybrid Tea, of bright and pleasing colour; it is very free flowering, and for its beauty we may forgive its hybrid character; but still not admit it amongst pure Tea Roses.

Such are the flowers which have come across my line of vision this year; it shows that, after all—the great number of new Roses is no indication of worth, and that every year a quantity of rubbish is brought forward which might have been passable a few years ago, but is now useless; and, 2ndly, that notwithstanding the great perfection to which the Rose has been brought there are still prizes to be gained by raisers of seedlings, and the encouragement which has been given to our home-raised flowers will, I hope, enable them to show that they do not do these things better in France.

NEW ROSE, LADY CASTLEREAGH.

A week or two since I received from Messrs. Alexander Dickson & Sons, of Newtownards, Co.

Down, Ireland, some blooms of a new Tea-scented Rose, which I think is likely to prove a useful addition to this beautiful class, as their *Miss Ethel Brownlow* has already done. It is a well-shaped flower, and evidently both vigorous in growth and profuse in its blooming; the colour is very pale pink or white, with salmon-pink in the centre. It is not quite like any Rose in this class.

It is pleasant to be able to record that our Irish friends are not behindhand, and that two, at any rate, of their first batch of Roses—*Earl of Dufferin* and *Miss Ethel Brownlow*—have grown in the estimation of the Rose world. *Wild Rose*.

## THE CHEMISTRY OF VEGETATION, IN REFERENCE TO THE GROWTH OF THE POTATO.

(Continued from p. 185.)

**AVOGADRO—MOLECULES.**—The paper of Gay-Lussac mentioned above (on the combination of gases, 1809) attracted the attention of an Italian physicist, Avo-gadro. A paper which he wrote in comment appeared in 1811.\* It is referred to here because it contains the suggestion that there must be two kinds of molecules (he uses this word as Dalton had used particles and afterwards atoms). He speaks of compound molecules and elementary molecules. His paper is a much more weighty matter than a question of nomenclature. But from that time the introduction of the word "molecule" into the atomic theory has led to much confusion—nay, even acrimony and ridicule. Chemists and physicists have used the words with different significance, and, like the two stalwart knights of yore, who each saw only one side of the suspended shield, while ever ready for doughty deeds, they have belaboured one another with wordy fight. It seems at last to be generally admitted among chemists, whatever physicists may please to do, that the word atom shall be used for a single atom, and molecule for a group (two or more) of atoms held together by that unknown "affinity."

There are many difficulties, as especially in what is called dissociation, and the fight cannot be said to be over. To give a rigid definition of a molecule would be rash. But the way in which, among chemists, the word is now used may be illustrated.

Two atoms of H and one of O

unite and form one molecule of water

To carry out Roscoe's illustration of a mazy dance an atom of H has but one hand (or one quantivalence). It is called a monad.† O is called a dyad—it is is valent to carry out the illustration it has "two hands," and can take a partner in each hand. Linked together they make one molecule of water. Or again, one atom of C can unite with one or with two atoms of O. C is "four-handed," a tetrad. It can form a molecule of carbon monoxide

—where two "hands" of the C are left free; or a molecule of carbon dioxide with two atoms of O

This dioxide is called commonly carbonic acid.‡

The combining weight of a molecule is the sum

\* Essai d'une manière de déterminer les masses relatives des molécules élémentaires des corps et les proportions selon lesquelles elles entrent dans ces combinaisons. *Journ. de Physique*, 1811, 1811.

† monos, monos, one; dyo, duo, two; tris, three; tetra, four.

‡ Each struggle against the circles represents the "valency" of the element concerned. Whatever may be thought as to whether it was or was not a good word to adopt, it is to no purpose to discuss here. Experiments have led to the conclusion that a form of force or forces, expressed by the word "valency" actually exists in Nature.

of the atomic weight of all the atoms in it. Thus carbon dioxide molecule has twice 16 for O, that is 32, and one 12 for C. That makes 44.

#### GAY-LUSSAC AND BERZELIUS.

It is to Gay-Lussac, already mentioned, that we have to turn for the earliest successful attempts to bring chemistry to bear on elucidating the composition of plants. In conjunction with Thénard, on January 15, 1810, he communicated a paper\* to the Institute on the analysis of fixed organic compounds. Their method was to get the carbon to unite with oxygen in the form of carbonic acid; the hydrogen to unite with oxygen to form water. Their difficulty was to find a means of collecting the results and to find a suitable agent to supply the oxygen. They collected over a mercury trough, and for a supply of oxygen they employed "muriate suroxygéné de potasse," which we now call potassium chlorate (some call it chlorate of potash). All the chlorates readily give up oxygen on heating, and potassium chlorate is a very convenient form. They had to devise their apparatus, of which they appear not a little proud, as they speak of the especial merit of the tap they invented. With this they analysed sugar, gum, starch, &c. The paper is one of interest, for to the present day the carbon in analyses is estimated as carbonic acid and the hydrogen as water.† The object is to ascertain the weight of carbonic acid and of water obtained. As the relative proportion of carbon to oxygen in carbonic acid and of hydrogen to oxygen in water is known, the actual weight of carbon and hydrogen given off is obtained by calculation. Now, though the same principle is followed, a totally different apparatus is used; either the "combustion tube" of Liebig or some modification of it. Their results are given in percentages.

It was a question at that time whether the laws of multiple proportion held good with regard to the composition of animal and vegetable bodies. Berzelius energetically took this subject up. Plants and animals were called organised bodies, and the study of their chemistry came to be called organic chemistry. Berzelius in 1814 much improved the methods for its study. He was the first to give, among other things, the composition of starch, not as Gay-Lussac, and Thénard, and others had done in percentages, but in a formula. His earliest published result was  $C_6H_{12}O_6$ , figures which, however, were modified.

W. S. M.

(To be continued.)

### VEGETABLE PRODUCTS IN VERA CRUZ.

THE growth of Tobacco in the State of Vera Cruz is said to be increasing considerably, the present production amounting to nearly 6,000,000 lb. per annum, and the average cost being about 5½d. per pound. About 23 per cent. is exported to foreign countries, and of this export somewhat less than half is of manufactured tobacco, and comes chiefly to England, the remainder is consumed in the Republic. For the highest quality of Tobacco as much as 10s. 6d. per 100 leaves has been obtained, but this quality is very scarce. Notwithstanding its primitive method of cultivation, Vera Cruz Tobacco

is obtaining—and deservedly—a rapidly increasing reputation, and the tobacco manufacturers of this part are increasing the size of their factories and the number of their operatives, and paying greater attention to the selection and the sorting of the leaves, and are, in fact, producing a very superior article to the Vera Cruz cigar of two years ago, or even of last year. This improvement in the manufacture will, of course, increase the market, and also give great encouragement to the planter; but what is chiefly wanted is capital, combined with the better cultivation which is so necessary, but so difficult to obtain, in the present financial condition of the majority of planters.

#### VANILLA.

The Vanilla bean grows wild in the cantons of Misantla and Papantla, and it is also cultivated there in a primitive manner by the Indians. It is prepared for market by the cultivators and collectors, and often before it is quite ripe. This is especially the case with the wild Vanilla, one family taking it early lest another family should get it when quite ripe for harvest. The systematic and rational cultivation of Vanilla in the cantons just mentioned would certainly be a remunerative business. At present the quantity produced is about 8000 mils (i.e., 1000 pods), worth about £3 to £3 10s. per mil.

#### FRUITS.

The fruits of the State of Vera Cruz are of great variety, and grow in such abundance as to be exceedingly cheap. The production of Pine-apples is about 500,000 per annum; they are grown in fields, and their local value is about 1d. to 1½d. apiece. Plantains are a fruit universally consumed, and over 10,000 per annum are actually harvested; their local value is less than 1d. per 10 lb.

#### PITA FIBRE.

This fibrous plant grows wild in Vera Cruz, and can be cultivated with very little care. Its fibre sometimes measures 3 yards long, and is very silky in appearance; but unfortunately its preparation for market is at present difficult and expensive. The State Government is, however, about to offer a large reward for a machine to reduce Pita to a marketable state without injuring its beautiful fibre, and without making its cost of production too high, having regard to its market value. It is most probable that such a machine will be produced, and if so, Pita will become, undoubtedly, the first article of produce and export of this State.

### TREES AND SHRUBS.

#### ABIES MAGNIFICA (PICEA OF GARDENS).

WE have received from Sir John Walrond a cone of this species with the following interesting details:—"Two plants were bought twenty-seven years ago, both under the name of *Picea nobilis*, but they differed so greatly one from the other in habit that it was suspected that one of them might prove to be *Magnifica*. The difference in habit consisted in this—1st. That all the lower branches of the possible *magnifica* died back, leaving a bare trunk for about one-third of its height, the leader remaining healthy, while all the *nobilis* remain feathered to the ground. [Whether this is a specific or merely an individual character remains to be seen.] 2nd. The possible *magnifica* never produced a cone, while much younger plants of *nobilis* cone freely. The supposed *magnifica* has come at Bradford for the first time this year." The cone obligingly sent by Sir John Walrond is undoubtedly that of *A. magnifica*; it is a thick, oblong, blunt cone, golden-brown in colour, and with the bracts concealed within the scale, as shown in *Gardeners' Chronicle*, June 12, 1875. The young bark is covered with a rufous pubescence. The upturned leaves are four-sided, and not grooved. The leaves of *magnifica*, seen from the under surface of the shoot, are much curved, with the convexity downwards.

In *A. nobilis* the leaves are broader, flatter, distinctly grooved on the upper surface, and not so strongly curved as in *magnifica*. The cones also are more tapering and glorious in their golden-bronze bracts reflected over the purple scales.

*A. magnifica* is later before starting into growth in spring than is *A. nobilis*.

The very beautiful but puzzling cone sent to us from the Cranston Nursery some year or two ago, must not be overlooked. Its leaves are more like those of *magnifica*, being either not grooved at all or only grooved at the base. The projecting bracts are like those of *nobilis*, but not reflected, while the general shape of the cone is that of *magnifica*.

J. W.

### PLAGIANTHUS LYALLI.

THIS is a Malvaceous shrub, or low tree, occurring on the mountains of New Zealand, deciduous above 3000 feet, but evergreen below that level. The leaves are shortly stalked, from 2–4 inches long, ovate, cordate, acuminate, deeply crenate, glabrous above, covered with white stellate down beneath. The flowers are placed at the ends of short axillary stalks, are white in colour, and each about three-quarters of an inch across. The botanical history of the species is given in Sir Joseph Hooker's *Handbook of the New Zealand Flora* (1887), p. 30, a coloured illustration being also given in the *Flora of New Zealand*, i., 31, t. 11. For garden purposes, the illustration at fig. 24, p. 209, will suffice to show what a beautiful shrub it is. The specimen from which our figure was taken was obligingly supplied by W. E. Gumbleton, Esq., of Belgrove, Queenstown, near Cork. It is hardy in Southern Ireland, but is worth shelter in colder spots.

### HARDY FLOWERING PLANTS.

**ARUM DRACUNCULUS.**—A very showy and attractive hardy Arad is this species, said to have been introduced to our gardens from Southern Europe more than 300 years ago, and yet how strange it seems that we do not meet with it more frequently in private collections than we do, considering its hardy character, freedom in flowering, and easy culture, which facts must be taken as my excuse for drawing attention to it in your columns at the present time. To those of your readers who are interested in the cultivation of hardy perennial plants, and who have not as yet made its acquaintance, a brief description may be acceptable, and may approximately be stated thus:—Rootstock tuberous, stems erect, leafy, densely spotted or blotched with green and grey—hence the popular name, Dragon plant—2 to 3 feet high. Leaves palmately or pectately divided on long stalks, divided into seven to ten linear-lanceolate, undulate segments, 3–6 inches long, with dark green shining surface. The greatest point of attraction, however, will be found to centre in the spathe or coloured bract, the inner surface of which is of a deep chocolate or brownish-purple, from 8 to 12 inches long, 6 inches wide at its broadest part, obliquely campanulate in shape, tapering

\* *Journal de Physique*, 1810, vol. lxx., pp. 257–266, reprinted in *An. de Chimie*, lxxiv., pp. 47–64.

† The following very simple experiment, that can be made without special apparatus, is instructive for those who have not had a chemical training. It needs only a clean plate and a damp cloth with a candle, lamp, or gas-jet. Leaving impurities out of consideration, the gas supplied to our houses is hydrogen and hydrogen in combination with carbon. Paraffin and oils for lamps are liquid combinations of carbon and hydrogen. Candles are also combinations in solid form of carbon and hydrogen. The phenomenon of combustion in each case is similar. The carbon unites with the oxygen of the air and forms carbonic acid. The hydrogen unites with the oxygen and forms water which passes away as invisible vapour, the temperature being high from combustion. But if a plate kept cool with a damp cloth on it be held close over the flame the water becomes visible in drops. The fact of carbon (freed from its combination with hydrogen) being present can be seen by holding the plate near the top of the blue part of the flame.

to a point at the top; base convolute. Spadix 6—8 inches long, of a lustrous dark purple hue. Altogether the plant has a most singular and striking appearance when in flower, the latter is not conspicuous, and situate at the base of the spadix. I may also add that, when in this condition, its odour is the reverse of agreeable or pleasant, and for this reason it ought never to be cut and stood in water to remain in a close room. As to treatment, it will be found to do well in rather a damp, loamy soil, and shady situations, but it will also grow fairly well under less favourable conditions, and may be in-

peduncles or upper branches, the whole forming rather a long loose panicle. When fully expanded, the disc florets are of a deep golden-yellow, outer or ray florets pale lavender, narrow, and somewhat numerous, having a triple row. Its time of flowering extends over a period of four or five weeks—July and August. The plant is very hardy, and will stand through our severest winters without protection. When growing in strong loamy soils it ought to be lifted, divided, and replanted about every second or third year, or it will form such dense masses as to require more than ordinary attention in tying up to

place in a garden, although I may say it will do very well in a drained border, where it can enjoy plenty of sun. In flower July and August, and may be increased by division in spring or autumn.

*BUTRACHUM SALICIFOLIUM*

belongs to the natural order Compositæ, and is worthy of a place in all choice collections of hardy perennial plants. Under good cultivation it will grow 2 feet high, and form quite a bushy plant if left undisturbed for three or four years; and it will produce in abundance flowers that will be found useful for decorative pur-

FIG. 21.—*PLAGIANTHUS LYALLI*: HARDY SHRUB: FLOWERS WHITE: POLLEN GRAIN MAGN. 200 DIAM. (SEE P. 208.)

creased by division early in the spring, just as root-action begins. In flower July and August.

*STENACTIS SPECIOSA*

should be grown in all gardens where cut flowers are in request; its freedom in flowering, together with its handsome appearance, renders it one of the most useful border plants we have at this time of the year. The flowers are much like some of the Michaelmas Daisies in general appearance, and, like those plants, this belongs to the natural order Compositæ, and to the tribe Asteroidæ. Under good cultivation the plant grows from 2 to 3 feet high. Stems slightly branched; leaves entire, linear; flower-heads  $1\frac{1}{2}$ —2 inches across, solitary on the

sticks. May be raised from seed or increased by dividing in spring.

*ERIGERON ALPINUS*.

This is a British plant, and so closely do the flower-heads resemble those of the last-named, that a novice might easily mistake one for the other if two flowers were cut from the plants and placed side by side. In general appearance, however, the character and habit of the plants are quite distinct, the one under notice growing from 6 to 12 inches high only; the leaves also are much shorter, and the flower-heads produced in the form of a loose corymb. It is well adapted for growing on a rockery, and which, strictly speaking, may be said to be its proper

poses. Stems erect, much branched. Leaves entire linear, or, as the specific name implies, Willow-leaved. Flower-heads deep golden-yellow, 2 inches across, solitary on long wiry peduncles. We do not frequently meet with this species, nevertheless it is probably destined to become a favourite when better known, and will be found a useful second or third row plant in a mixed border. A well-drained soil and sunny position will be found to suit it, and it may either be raised from seed sown in pots in a cold frame, or increased by dividing in the spring. Flowers July and August.

*POTENTILLA LUTEA*.

I can hardly say that this is a good thing, but it

is noteworthy chiefly as a rarity, and as a species seldom met with outside botanical gardens and the best private collections, and that fact must be accepted as my reason for alluding to it here. As compared with William Rollinson and others of our hybrid varieties it is far from being attractive or showy in appearance. The plant grows from 3 to 4 feet high, and is exceedingly floriferous. Stems slightly pilose. Stipules long and pointed, distinct from the enlarged base of the leaf-stalk. Leaflets five, oblong, toothed and scabrous. Flowers are produced in the form of a rather large, loose terminal corymb, and are pale yellow in colour, being, when fully expanded,  $\frac{3}{4}$  inch across, petals free or separate from each other, and rather shorter than the calyx. Will grow luxuriantly in a calcareous soil, and may be increased by division in spring or autumn. In flower July and August.

#### CECOTHERA YOUNGII.

An evening Primrose, and decidedly one of the best we have in our gardens at the present time, and which ought to be cultivated in all collections of hardy plants where space can be afforded. Its bright golden-yellow flowers give a charm and splendour to a mixed border just now that cannot be equalled or surpassed by any other plant that I am acquainted with. Taking a single flower, it will be found to closely resemble *C. Fraseri* in colour, but in all other respects it is quite distinct from that well-known and widely-grown plant, the stems being more branched and of a deep reddish tinge, leaves not so broad or long, flowers more numerous, larger, and on longer footstalks than *C. Fraseri*. The plant grows about 3 feet high, and delights in a good sandy loam or peaty soil or even a chalky compost, providing the border is well drained. Flowers in July and August; may be increased by division early in spring.

#### CORYDALIS LUTEA.

A British species, belonging to the *Fumitory* family, and being an erect spreading plant of from 6 to 9 inches high, it is eminently adapted for growing on rockeries. The plant forms a tufted rootstock. Although they will live and produce flowers for four or five successive years, the plants cannot strictly speaking be regarded as truly perennial, and it will be found best to raise plants from seed every third or fourth year. Leaves of a beautiful pale green, much divided, the segments wedge-shaped. Flowers in racemes, pale yellow, from 4 to 6 inches long, each flower having a short and rather broad spur. To succeed with this species, and ensure its living through severe winters, it must be grown in rather a poor sandy loam; and where this does not exist it will be found a good plan to mix a few small stones or broken pieces of cinder along with the soil to secure ample drainage.

#### VERATUM NIGRUM.

This is quite a remarkable and noteworthy herbaceous perennial, said to have been introduced into this country from Siberia so long ago as 1596—a circumstance that justifies one in expressing surprise that it is so seldom met with, comparatively speaking, in private gardens. It is proof against our severest winters without any protection whatever, and is not over-particular as to soil or situation; add to this the fact of its flowers being a nearer approach to black in colour than any other of our hardy flowers, and we have here a species that ought to be found in all gardens where hardy perennials are made a special feature of the place. In one of the mixed borders here there was a plant just coming into flower at the time of writing, and it promises to be the most conspicuous in the gardens we shall have during the next two or three weeks, the spike being fully 6 feet high with every prospect of its lengthening another foot or 18 inches. What a picture it will present when at its best, may, by those who are acquainted with the species, be more easily imagined than described. The plant will also be found an interesting and attractive object for many weeks previous to flowering, chiefly by reason of its handsome coriaceous

foliage, which in shape is broadly ovoid, acuminate, from 8–10 inches wide and 12–15 inches long, more or less corrugated. Root-stock may be divided in spring as soon as growth begins. Flowers in August. *J. Horsfield, Hayfesbury.*

## CULTURAL MEMORANDA.

### ALSTRÖMERIAS.

THESE stand almost unrivalled among herbaceous plants, as they are exceedingly floriferous, and endure a long time when cut. They are not hardy enough to succeed in all places, but will do well in any ordinary favoured spot in most gardens, the best situation for them being on a sloping south border, or under the foot of a sunny wall, where, with the slightest surface protection, they will stand the winter. The most suitable soil is a light sandy one, and if not naturally well drained, the bed or border intended for them should be dug out a yard or so deep and have 6 inches of brick rubbish placed at the bottom, and over this some half-rotten leaves or strawy manure, to keep the interstices open and clear. This done the soil may be returned, and in doing this it will be advisable to mix in with it some leaf-mould and road-scrappings, as the plants like a loose run, that they may be able to send their fibrous roots down freely; and unless they can strike deep the frost kills the crowns. To prevent this, at starting it is necessary to plant well below the surface, or it is a good plan to sow seed where the plants are to remain and grow, which saves transplanting; and this is a difficult matter with *Alströmérias*. The best time to sow is as soon as the seed is ripe, as though it does not germinate then it lies safe in the ground, and will come up the following spring, and by the end of summer the plants will be fully established. To render them safe for the winter cover with cocoa-nut fibre or rough leaf-mould. *J. S.*

### LAYERING CARNATIONS.

There is no readier or surer way of raising a stock of *Pinks* and *Carnations* than layering in prepared soil having a surfacing of sand. Put 2 or 3 inches of this mould around each plant, remove a couple of the grasses from the base of each shoot, make a clean cut half way through and 1 inch long, in an upward direction from the bottom joint; bend the shoot, pressing the tongue thereby formed into the sandy soil, and secure it there by a small crook, giving water through a fine rose to settle the soil. This should be done as soon as the bulk of the bloom is over—usually early in August.

### EPHEDRUM SALMONUM.

The large salmon-sulphury coloured flowers of this plant are very sweet and delicate looking, and are useful decorative plants, not only in the greenhouse and conservatory, but also for rooms. Cuttings put in singly at the end of autumn, in 3-inch pots filled with a mixture of three-parts light loam and one of leaf soil, with a surfacing of silver-sand, and plunged in a hand-light containing 4 or 5 inches deep of sawdust in a stove, will soon root. They do not require much water at the roots, but when the soil becomes dry, sufficient water to thoroughly moisten it should be given. Standards, pyramids, and large plants of any desired shape may be obtained more quickly by grafting on to the *Pereskia*, and growing on heat and moisture; the moss round the graft and stock being kept moist until the union is completed. *H. W. W.*

### PHACELIA CAMPANULATA.

Among the numerous meritorious plants introduced by Mr. Thomson, of Ipswich, this is one of the most beautiful, as the richness of its lovely blue flowers is unrivalled. Some few years ago, when seed was first received, great care and pains were taken in raising plants, as it was thought to be what gardeners term "miffy," and a bad doer. It is, however, one of the best annuals, as it comes up outdoors from self-sown

seed, and grows freely in suitable soil. No garden should be without some plants in the borders, where it may be sown either in patches in the ordinary way, and thinned out, or raised in pots in frames, and planted out after. The flowers are bell-shaped, about half an inch across, and are held erect. *J. S.*

## ORCHID NOTES AND GLEANINGS.

### ÆRANTHUS CURNOWIANUS.

This is a valuable addition to the set of small but lovely Orchids, chiefly represented by *Angræcums*, which have been introduced in recent years from Madagascar. It is well worth the small space it occupies in the Orchid-house. The distichous leaves are only  $\frac{2}{3}$  inches long by  $\frac{1}{2}$  inch broad, bilobed at the apex, slightly scabrous, and of leathery texture. The comparatively large flowers are solitary on short peduncles, and measure nearly 2 inches in diameter. The sepals and petals are lanceolate; the lip is broadly ovate, with a slender tapering spur, 4 inches long. The whole of the flower is a pure glistening white, except the lower part of the spur, which changes to green. This species was described by Reichenbach in the *Gardeners' Chronicle* for March 10, 1883. A plant is now flowering at Kew, which grows well in sphagnum, suspended near the glass in the warm-house.

### ORNITHOCILIUS FUSCUS.

A plant of this, sent to Kew from Burmah by the Rev. Mr. Parish, two or three years ago, is now in flower. It is an uncommon species (sometimes known as *Ærides difforme*), with small flowers, having a lip of very singular structure. The pendent racemes of forty or more flowers are produced from the axils of the fleshy oblong leaves, which are 4 inches long, and unequally bilobed at the tips. The sepals and petals are brownish-yellow, marked with purple lines. The curiously formed lip has a short conical spur, and is three-lobed; the prominent middle lobe is erect, horse-shoe shaped, and fringed, being of a reddish-purple colour. This plant requires the same treatment as *Ærides*.

### STENOGLOTTIS FIMBRIATA.

Either with or without flowers, this is a very distinct and attractive little Orchid, and being of easy culture it deserves to be seen oftener than it is at present. Being a native of South Africa—a part of the globe which does not yet appear to have many attractions for Orchid collectors—is a fact which perhaps accounts for its rarity in this country. Several plants brought by Mr. Watson from the Cape are in flower now at Kew. The leaves are very ornamental, being deep green, with several longitudinal rows of black spots; they are 4 inches long, have a wavy outline, and spread horizontally near the surface of the soil. The rosy-pink flowers are densely produced on scapes 6 inches high, and have a three-lobed lip spotted with purple. These plants are, in their native state, found growing on boulders near the banks of the Buffalo River. The Kew plants grow in the cool-house, and, in imitation of their natural conditions, are fastened on a piece of limestone, with sufficient sphagnum to cover the fleshy roots. To this treatment they have adapted themselves perfectly, and now form a pretty picture. They may also be grown in pots in a compost of leaf-mould and fibry peat, with a surfacing of sphagnum. *W. B.*

### LELIA ELEGANS AT THE WOODLANDS, STREATHAM.

In the fine collection of Orchids belonging to R. H. Measures, Esq., the numerous beautiful and dissimilar varieties of *Lælia elegans* are now making a very fine show, the still rare *L. Turneri* being the handsomest and most stately in growth and flower. Some of the plants have stout pseudobulbs, over 3 feet in height, many of them furnished with very strong flower-spikes of eight to ten flowers. Of the beautiful collection the most beautiful is

*L. e. incantans*, n. var., *Gardeners' Chronicle*, September 17, 1887. Flowers 6–7 inches across, wax-like in texture, sepals and petals quite unique in colour, being Indian-yellow or yellowish-nankeen, the front coloured portion of the labellum being brilliant dark purple. Evidently of the same strain is *L. e. Measuresiana*, n. var., *Gardeners' Chronicle*, February 12, 1887. This has sulphur-coloured sepals and petals, and richly coloured violet front lobe and tips to the side lobes of the labellum, the tube being pure white. Also, following in the same way, is the lovely *L. e. Nyleptha*, which was illustrated in the supplementary sheet of the *Gardeners' Chronicle*, February 11, 1888. The sepals and petals are cream-coloured, or pale sulphur-yellow, the tube of the labellum being pure white and the expanded front lobe of the labellum, which is  $2\frac{1}{2}$  inches across, as well as the erected tips of the side lobes, rich dark crimson. *L. e. Mooreana* is of the true *Turnerii* colour, viz., sepals and petals dull rose and the lip purplish-crimson, but the flowers are more compact and the labellum shorter, reminding one much of the grand *Veitchian* hybrid *Cattleya Chamberlainiana*.

*L. e. cyanthus* is also of the rose-petalled strain, but very distinct and beautiful. The tube of the labellum is sulphur colour, and the front lobe rich maroon. The finest of all, *L. e. Tautziana*, is sending up three stout spikes. Other distinct forms in flower are *L. e. Houtteana*, *L. euspatha*, *L. e. Schilleriana*, and various forms of white or blush-petalled typical *L. elegans*. There is also a grand show of *Cattleya Gaskelliana*, some fine *C. Eldorado*, white and coloured; many rare *Cypripediums* and other things are in bloom, and notably a beautiful specimen of *Eulophia guineensis* with thirty-eight flowers with their flat rose-pink labellums. *Odontoglossum Schroderianum*, a very rare and distinct plant, is now in flower in the collection. The general appearance of the flowers call to mind *O. lave*, but the lip is broad and much more showy than in that species, the basal part rich crimson, the front pure white; the sepals and petals are wavy at the edge, the colour creamy-white blotched with brown. The plant has a glaucous tint, and is altogether distinct, and very handsome when in flower.

#### STANHOPEA PLATYCERAS.

This is certainly a king among Stanhopeas. It has larger flowers than any we have seen, and the colours—pale yellow with purple spots—are attractive, whilst for aromatic odours it is at least the equal of any of the kinds. It is a recently introduced plant, but figures of it have already appeared in the *Garden* and in *Reichenbachia*. The flowers are 6 inches across, the sepals being  $3\frac{1}{2}$  inches long by  $2\frac{1}{2}$  inches wide, slightly concave, and spreading. The labellum is proportionately large; the mesochil, or lower hollowed-out portion, is boat-shaped, and 1 inch deep, the horns are prominent and thick, and the front part of the lip is tongue-shaped, the whole length of the lip is 3 inches, and the column is quite as long. The pseudobulbs are 2 inches long, pear-shaped, and furrowed; and the leaves are 15 inches by 4 inches. A plant of this species is now in flower at Kew. It is a native of Columbia. *W. W.*

## FRUIT REGISTER.

### ALEXANDER PEACH.

As showing the earliness of this, I may mention that we gathered ripe fruit on August 6 from the open wall, which shows its great value for succeeding others grown in houses or for forcing, as it is ready long before others (except *Early Louise* or *Beatrice*, to both of which it is superior), and puts on a fine colour. Perhaps some correspondents who have grown both would oblige by kindly giving their experience or opinion as to whether this is really synonymous with *Hale's Early*. If they are, we do not want the two names. I would remark to those young inexperienced cultivators about to plant trees when the time comes, how much they lose by

the old fallacious system of shortening back the branches, as by pursuing that method of treatment the work has to be done over and over again, whereas if the shoots are left full length, and every encouragement given the foliage, root-action, as a natural consequence of the extra leafage, is doubled, and the wall or trellis on which the tree is trained is rapidly furnished, and the plant quickly established. *J. Sheppard, Woolverstone.*

### EARLY RIVERS PEACH.

This is a fine showy-looking Peach, with a pale skin, the fruit being about the size of the old well-known *Noblesse*, but, unfortunately, it lacks quality, and what also tells against it is, that it is very apt to crack or split at the stone. The tree is a strong grower, and not subject to mildew, and if the fruit were only better flavoured it would be a very desirable variety to have in a garden. *J. S.*

## WHICH IS THE EARLIEST PEA?

**WRINKLED VARIETIES.**—We now possess a valuable group of early dwarf wrinkled Marrow Peas of great value for early crops in the open, and also for frame and pot culture. In the front rank of these must be placed *William Hurst*; it is a little taller than *American Wonder*, but it is quite as early, and bears the finest pod of the two. It will probably be very scarce for a year or two more, and then I think it will become very popular. A new *Pea*—that is, a *bona fide* new variety—is, in these days, sent out in small quantities, owing to the stock being limited, and it takes two or three years at least before it becomes widely known. *Chelsea Gem* is a counterpart of this, only that the seed is white, while that of *William Hurst* is blue in colour. *American Wonder* is still a good useful dwarf *Pea*, and I should think it is an American selection from *Little Gem*, one of Dr. Maclean's varieties of some forty years ago. *Little Gem* is a trifle taller than *American Wonder*. *Premium Gem* appears to be a slightly taller growing form of *Little Gem*. The latter, and, indeed, all the early dwarf Wrinkled Marrow Peas require persistent selection. They all appear to show a tendency to run back to small-podded types. At Messrs. Hurst & Sons trial-grounds at Springfield, Chelmsford, where these notes were taken, there were several rows of a very select stock of *Little Gem*, bearing fine pods, containing seven and eight Peas. The seed from this stock is carefully saved; it is sown again next year; rigidly looked over, and the produce is sent out to be grown in quantity for sale; perhaps it is of a more robust character; but since *American Wonder* came across the Atlantic, *Little Gem* has not been in so much demand as it formerly was. *Multum in Parvo* is a variety that I think was originally selected from *Little Gem*; it is a true wrinkled *Pea*, the seed white, and bears a distinct broad and stout pod, and it is of excellent quality for the table, but somehow or other it is always scarce, and the price high. It is in great demand in Scotland, but the supply is rarely equal to it.

*Bliss's Abundance* is another American introduction, of the type of *Advancer*, but rather longer in the pod and a little later: it is, I think, a probable selection from it. *Advancer*, where grown in a rich light soil, is an early table *Pea* of the finest quality. I called upon a market gardener a short time ago who was growing a good stock of this *Pea* for his own eating, and he was loud in his praise of it, on account of its high table and cropping qualities. *Laxton's Standard* or *Charles I.* is a good useful dwarf free growing and bearing *Pea*,  $2\frac{1}{2}$  feet in height, with curved pods that fill well; but it is said not to be of the best quality. I think it is a very fine market gardener's *Pea*, and should displace *Harrison's Glory* and one or two older sorts of a similar type.

*Laxton's Dr. Hogg* is a first early wrinkled *Pea* that does not appear to have made the mark expected of it. It was only one day behind the earliest this season: it produces good sized curved pods, of about

the same character as *William I.* It appears to show a tendency to produce both white and green pods—a mixed condition not unusual in several of Mr. Laxton's Peas. But I feel justified in describing it as a very good early *Pea*, a free cropper, and of excellent quality; it is about 2 feet in height. *Early Bird* appears to be the same, and it is a reasonable inference that the green-podded form was selected and sent out under the latter name. *Stratagem* is well known as a standard early dwarf wrinkled *Pea*, producing fine pods, and valuable for early exhibitions.

I think *Laxton's Alpha* has had to give place to *William I.* Mr. Laxton did good work in fertilising, in order to give us a new race of Peas; but he attempted too much, or—shall I say?—he introduced too many varieties, as there is an inevitable sameness of character among many of them. *Alpha* has medium-sized pale blue wrinkled seed, and a curious kind of fold both at the top and under-sides of the pods and it does not appear to be very hardy. *Day's Early Sunrise*, originally sent out as a first early *Pea*, has fallen behind some of the earlier and later introductions, in point of earliness. It is properly an indented *Pea*, though classed as a wrinkled one. But it is so robust in constitution that it makes a good variety for autumn or early winter sowing, because it stands hard weather well. The autumn sowing of Peas is not so much practised as it used to be. It is said of *Day's Sunrise* that autumn sown seed produce crops twice as large as when sown in spring. For spring sowing this *Pea* is now distanced by others of better character and quality. *Robert Fenn* is a second early *Pea* that is not nearly so well known or appreciated as it deserves to be. It is a remarkably good wrinkled variety, of dwarf growth, producing a large crop of large pods of the finest quality. It is a decided improvement on *Maclean's Best of All*, and has one remarkably good quality—it keeps its character well, and does not run out.

So much for the early wrinkled Peas. At Springfield, Chelmsford, the whole of the trial Peas are grown in ordinary field soil without any of that special cultivation that is given in gardens. It is only reasonable to imagine that the characters of the Peas grown in ordinary land, in a fully exposed position, can scarcely tally with those grown in the better cultivated and more sheltered ground at Chiswick; or in Messrs. Veitch & Sons' trial grounds at Turnham Green. Perhaps the conditions under which they are grown at Chelmsford are more favourable to an appreciation of the character of Peas under ordinary garden cultivation than when grown in richer soil. That climate and soil have a great influence upon growing crops of Peas there can be no doubt. Some varieties appear to do best in a dry, others in a moist season. But the heights to which Peas grow this season are greatly in excess of last summer's experience, and generally the varieties may be regarded as rather more dwarf than they appear this season. *R. D.*

## THE MELBOURNE HERBARIUM.

HEREWITH I send you a photograph (just taken) of the Herbarium here. The main building, consisting of one large room, was constructed in 1857, under the direction of Captain (now Major-General) Pasley, the then Minister of Public Works for Victoria. The material used for the walls is basalt, the ordinary building material in Melbourne; the roof is constructed of English tiles, rarely seen in use over here, slate being generally adopted for roofing purposes. The cost of the main building was about £1000, but several hundred pounds sterling were expended subsequently for fittings in wood of *Cedrela australis*. Three years ago, when the great *Sonderian* collection was acquired, an annex of galvanised iron was added at a cost of a few hundred pounds with further costs for shelves, &c., amounting to several hundred more. The total collections of dried plants comprise now about half a million sheets, each as a rule containing several specimens.

My own collections were presented to the public herbarium. I commenced collecting in 1840, and have continued in Australia uninterruptedly since 1847 (till 1853 entirely at my own private expense), and later also with my own means to a not inconsiderable extent.

About 1859 Dr. Steetz's important collections were added by departmental purchase; later, by the same means, Mr. T. Drummond's private set of West Australian plants, and various other collections. Many other things were secured for Australia, either by purchase or by exchange, and large donations were received from Sir William and Sir Joseph Hooker, including typical specimens of R. Brown's Australian and Sir Joseph Hooker's Indian plants. It would make too long a story, to enumerate even the main treasures of the herbarium in a brief communication like this; but it is my intention to publish a small volume explanatory of the richness of our gatherings here. Through Dr. Sonder's herbarium, original specimens from the collections of several disciples of Linnæus were obtained, coming from Professor Lehmann's herbarium. Thus we have many authentic specimens from Thunberg, Giseke, Ehrhart, and Gouan. In Australian plants the Melbourne collections are by far the richest of any in existence. But South Africa is also particularly well represented, chiefly through Steetz's and Sonder's herbaria; and although the main portion of the South African plants went many years ago from Sonder's herbarium to Stockholm, authenticated fragments of most are here also. No region of the globe is unrepresented in the Melbourne Herbarium, and this often by original material not extant in many other places nor now obtainable anywhere.

The herbarium building is about a mile distant from Melbourne, within the Government House Reserve, and in the close vicinity of the astronomic and meteorologic observatory.

The technologic-botanic collections, accumulated largely by my exertions, are located in the "Technologic Museum," close to the great Public Library in the centre of Melbourne, the museum being under the administration of the trustees of the Public Library also. A special hall is soon to be provided for the vegetable technologic articles, as the timber collections, and also those of various other vegetable products are so extensive; moreover, the Centennial Exhibition is sure to add to those riches. *F. v. Mueller.*

### SCHOMBURGKIA TIBICINIS.

THIS fine plant (fig. 25) gives an illustration of the unmerited application of a bad name, for it is currently reported to be difficult to flower; such, however, is not the case, otherwise it would not flower regularly every year with those who grow it properly. Sir Trevor Lawrence flowers it regularly, and in the fine Cattleya-house of Messrs. Jas. Veitch & Sons, at Chelsea, are many specimens which flower as freely as could be desired. The fact is, it requires growing in a well ventilated intermediate-house, and in a good light. The pseudobulbs are of peculiar structure, hollow, and somewhat resembling a cow-horn. The stout flower-spike, 7 or 8 feet in length, bearing at the top many flowers with reddish-brown or purplish sepals and petals; the side lobes of the lip yellow, streaked with purple and edged with white, the front lobe white, veined and suffused with purple. The plant was discovered by Mr. G. Ure Skinner, in the highlands of Honduras, over fifty years ago, and it also occurs in Mexico and Guatemala.

**DUTCH BULBS, &c.**—Messrs. Ant. Roozen & Son, of Overveen, near Haarlem, have published *Notes on the Cultivation of Dutch Bulbs and Other Plants*. The book has no pretension to be a scientific treatise, but will be very useful to many for the sake of its practical hints. A second edition is sure to be called for, and this will give the opportunity for correcting errors and misprints.

## PLANT NOTES.

### THEROPOGON PALLIDUS.

THIS is an extremely pretty plant of the Liliaceous order, bearing flowers somewhat similar to those of the Lily of the Valley, though its flowers lack the whiteness of the above, as the perianth is tinged with red, but they are scented. The leaves are grass-like, and longer than the racemes. It is a native of the Himalayas, and was figured in *Bot. Mag.*, 6154. Grown in a cool-house, and potted in a mixture of loam, leaf-mould, and sand, and grown in

pollen from Sultani, though hardly an advance upon other kinds; one, a strong grower, and of a colour between the two, has done well for bedding-out purposes in sheltered places. It would be interesting to know if others who have grown *I. Episcopi* have plants bearing pollen. *W. Harrow, Botanic Garden, Cambridge.*

### IXORA MACROTHYRSA.

This is a magnificent plant when properly managed. It differs from the bulk of *Ixoras* in its habit of flowering only when the shoots are allowed to grow to a length of several feet, and when they are as thick as a goose-quill. Upon such shoots the flower-

FIG. 25.—SCHOMBURGKIA TIBICINIS: FLOWERS REDDISH-BROWN.

48 or 32-size pots, it makes a useful and attractive plant for decorative purposes.

### IMPATIENS EPISCOPI.

This perhaps should be considered as a variety of *I. Sultani*, though it is somewhat different from that species. The principal differences are—the stems are striped with dull red longitudinal lines, leaves smaller and of a darker green, flowers magenta and not so large as those of *I. Sultani*, and out of the many flowers we have examined the anthers appear abortive—no trace of pollen was to be found.

It does not develop into good specimens without frequent stoppings, whereas *I. Sultani* makes good plants with hardly any assistance in that way, but it makes a very good companion plant for the other, as its colour is far the brightest by lamp-light. Varieties have been obtained by crossing it with

heads are nearly 1 foot in diameter, half spherical, and crowded with starchy flowers of a deep scarlet colour. There are several plants of this species in flower in the Victoria-house at Kew, where the unusually large size of the heads of flowers attract much attention from visitors. Apparently the plant is little known, although it has been in cultivation about ten years. It was introduced from Sumatra by Messrs. Veitch, who distributed it under the name of *I. Duffi*. It is figured in the *Botanical Magazine*, t. 6853. The leaves are 1 foot long and 3 inches broad. *W. W.*

### EUCRYCLES.

One at least of the several species of this genus is worthy to be placed along with the *Eucharis*, on account of the size, purity, and elegance of its flowers. Two species, viz., *E. Cunninghami* and *E. ambio-*

nensis, have been flowering for some weeks in the Begonia-house at Kew. The latter is much the better plant, as the flowers are twenty to thirty in an umbel, on an erect scape over a foot long; each flower is  $2\frac{1}{2}$  inches across, in shape like a Eucharis, differing chiefly in having an irregular jagged staminal cup. The flowers are pure white and lasting. *E. Cunninghami* is smaller in all its parts, but still a pretty stove bulb. There are about a dozen flowers on an erect scape a foot long, each flower being 1 inch across, and pure white. Both species require warm greenhouse treatment, and a rest on a dry shelf when the leaves wither; they should be planted in a mixture of loam and leaf-mould with sand and a sprinkling of crushed bones. They like plenty of water whilst growing. *W. W.*

## PLANTS AND THEIR CULTURE.

**CRASSULAS.**—These fine old-fashioned plants are deserving of more extended culture than falls to their lot at the present day. It is true they are not well adapted for cutting from, yet well-flowered specimens are always conspicuous and useful decorative subjects for the greenhouse or conservatory, and for this purpose the old *Crassula* (*Kalosanthes*) *coccinea*, of which there are several varieties, is one of the best. These plants may either be grown as single specimens, or several may be grouped together in a pot; but whichever plan be pursued—and with the exception that it takes much longer to form a large specimen from a single cutting than when several are grown together—there is otherwise practically no difference in their management. In either case, plants whose flowering is past should have all the flowered shoots cut back to a point as far back as it is likely that fresh growth would again develop; they may then be stood out-of-doors, or in a light airy house, until such time as the cut-back shoots have pushed out fresh growths, when repotting should be done, previously carefully removing all loose soil, putting them for the time being in perhaps smaller size pots, making the soil quite firm and the plants steady, as if they are allowed to sway about in the pots they will not make satisfactory progress. But if they merely require a shift, do this, always affording the plants thorough drainage. These plants are, however, much better when than over-potted; indeed, large specimens may be kept for years in perfect health by simply removing the inert surface soil, and applying a sprinkling of some mild prepared fertiliser, then refilling the pot with the usual potting compost, which should consist of light fibrous loam, a small quantity of leaf-mould with a sufficiency of coarse silver-sand, or pounded brick rubbish, to keep the soil porous. As it is desirable that a few fresh plants should be added annually to the stock, the present is the best time to put in cuttings; select the points of sturdy shoots, about 6 inches long, trim off the bottom leaves, and cut evenly the base of the cuttings, placing about five of them in each pot, using large 60's or 48's filled with the compost recommended, with an additional pinch of sand round the cuttings. Stand them in a light airy position, and do not water them much until they are well rooted. Watering must at all times be rather under than overdone. If the roots are kept constantly soaked they have a tendency to decay; give water when it is required, and allow the soil to get rather drier than most plants before water is again applied. After the cuttings are rooted, if single specimens are desired, shift on and pinch out the points of the shoots until the required number of leads is obtained. Under this treatment it will be the second year before they flower; but if the potful is potted on, they form good decorative stuff the first year. A few treated in each way is usually the more serviceable plan. In the case of some of the smaller-growing species however, massing the plants is preferable; indeed, in such species as *C. jasminae*, or *lactea* and its variegated variety, this is the method invariably adopted by me. *Jasminae* is an exceedingly neat white-flowered species rarely growing more than 9 inches in height, and as brought to market by trade growers is a capital decorative plant. *C. lactea* has a lax trailing habit, and looks well when allowed to hang gracefully over the sides of the pots. *C. Bolusii* and *C. Cooperi* are two neat trailing or carpeting species, with very slender stems and prettily marked leaves, both are nice subjects to grow in shallow pots or

pans for the front row of the greenhouse. *C. lycopodioides* may be similarly used. It has hard warty stems with the leaves so closely imbricated that it much resembles a *Lycopodium*, such as our native species, *L. clavatum*, hence its specific name. These *Crassulas* winter best in a dry airy house, with a position near to the glass, and a temperature ranging between 40° and 60°. *C. Roehra falcata* is a desirable plant, but more properly belongs to the succulent group, (see p. 150).

**Cecylarians.**—The latest sowings of these should now be made, and, as before, in pans filled with finely prepared compost, which has previously been well watered. Sow thinly and evenly, but do not cover with soil—a piece of glass laid over, and the pan plunged in moss or other moisture-holding material and placed in a cool-house in such a position that the sun's rays do not fall directly on it. This treatment will usually be sufficient to avoid the need to give any water until the seedlings are well above the soil. If they appear to get dry damp the plunging material or dip the pans in water, taking care that the water does not rise so high as the surface of the soil. With these precautions an ample and speedy braid may be looked for. The plants from earlier sowings should be pricked off as soon as they are large enough to be handled. In this stage a somewhat stronger compost than that used for the seed pans should be employed, consisting of about one half good loam, the other half leaf-mould and sand, varying the latter according to the texture of the loam. Until the plants have made three or four fair-sized leaves they are better grown in boxes, the roots then being kept in a more equable state as regards moisture than if potted singly in small pots. Give the seedlings a very slight amount of shade, and, as soon as they have taken to the new soil, plenty of air. When about the size above-mentioned, they should be removed from the boxes and put into large 60's and 48's for the winter, adding more loam to the potting compost.

**Pelargoniums** which have been standing out, and whose shoots are now well ripened should be cut down, placed erect to break anew, and if they can be accommodated in a cool frame or greenhouse, where they will not get too wet at the roots, it is an advantage, the young growth being then stronger. *F. Ross, Pendell Court.*

## THE FLOWER GARDEN.

**PROPAGATING.**—A beginning ought to be made with the majority of soft-wooded summer bedding plants, *i.e.*, where cuttings are plentiful and providing they can be taken from the plants without spoiling the appearance of the beds. In some districts the growth of certain species of tender plants has been very slow this season, and it is more than probable that if the full number of cuttings required were cut off now the plants from which they were taken would be crippled and disfigured for the remainder of the summer. By far the better plan in such cases would be to put in fewer cuttings than usual, and when the proper time arrives pot up a greater number of the old plants. A suitable compost in which to root most kinds of bedding plants, consists of three parts loam, one of leaf-mould, and one of sharp sand, the whole being passed through a fine sieve before using it. Zonal *Pelargoniums* may be put in 6-inch pots, about a dozen in each, or in boxes 20 × 14 inches, and 4 inches deep. In preparing the same use clean pots or tubs for drainage, over which place a layer of moss or rough siftings of fibrous loam, and fill to within half an inch of the top with prepared compost, pressing it down moderately firm. If boxes are made use of they ought to be stood on small pots or wooden trellising till the time arrives for moving them indoors; guard also against overcrowding, or considerable loss from damping may be the result, the growths being unusually full of sap; tricolors are best put in singly in thumb-pots. Such subjects as *Coleus*, *Iresine*, *Königia*, *Mesembryanthemum*, *Lobelia*, *Tropæolum*, *Ageratum*, *Gnaphalium*, and *Heliotropes*, will be found to root freely in frames if carefully attended to in regard to moisture, shading from bright sunshine and ventilation until the cuttings are rooted, after which period plenty of ventilation should be afforded. For propagating these plants use clean 6-inch pots, and plenty of drainage, new pots being soaked in water beforehand. *Alternanthera* and *Verbena* may also be treated in the same way with the latter; however, I prefer to

propagate them in shallow boxes, over which panes of glass are laid till rooting has taken place. If frames in which Cucumbers or Melons have been grown are used for this kind of work the sides and the lights ought to be thoroughly cleaned inside, to rid them of red-spider and other insects, at the same time a layer of sifted cinder-ashes should be put at the bottom. Cuttings of *Pansies* and *Violas* may also be put in on outside borders, giving them rather a shady position and a sandy compost. Examine those that were put in earlier, pinch off the flowers, and fill up blanks. Almost all kinds of hardy bedding-out plants may be propagated now on beds outside; fork over the beds and rake in a liberal admixture of sifted leaf-mould and sand on the surface. A second batch of *Pentstemons* and *Phlox cuttings* may be put in 4-inch pots and placed in a cold frame, also *Rose cuttings*, if more are required, bearing in mind with the latter to take off shoots which have produced flowers, and inserting them in pots immediately they are taken from the plants. For further details refer to a previous Calendar.

**Seeds.**—Collect seeds of all hardy plants as fast as they ripen, *i.e.*, of such as are needed. This is one of those little matters in which care and judgment are required or the consequences may be vexatious and disappointing. It seldom happens that all the seeds on an outdoor grown plant are fully ripe at one time, and it will be found better to gather them at intervals of two or three days rather than all at one time. Care should also be taken not to collect seeds before they are quite ripe and the seed-vessel bursts, and with nearly all the *Compositæ* when the pappus or feathery hairs are well above the flower-head. Choose fine weather for this work, and name, clean, and store away in a cool dry place all such as are not required for immediate sowing. Seeds of many hardy perennials may be sown at the present time; and where the means at command will allow, sow in pots or pans and give them cold frame treatment in preference to sowing on borders outside. Use clean 4 to 6-inch pots, half fill with broken potsherds, over which place a layer of moss, and fill to the rims with a finely sifted compost consisting of two parts loam, one part leaf-mould, and one of coarse silver-sand. Many kinds of hardy annuals may now be sown on outside borders for early spring flowering, amongst which may be named *Saponaria calabrica*, *Candytuft*, red and white; *Clarkia pulchella*, *C. p. marginata*, *Collinsia bicolor*, *Limnanthes*, *Erysimum*, *Perofskianum*, *Virginian Stock*, *Bartonia aurea*, and many others. Choose a light and well drained soil of a rather poor character and sow in shallow drills 6 inches apart on beds 4 feet wide. They may be transplanted to their flowering stations, either in the autumn or spring, but if at the latter period avoid sowing too thickly. *J. Horsfield, Heytesbury.*

## THE HARDY FRUIT GARDEN.

**PLANTING STRAWBERRIES.**—The present is the most favourable season in which to make new plantations, if the ground has been prepared as previously advised, and the runners have filled their pots with roots. Before proceeding to plant, tread the ground firmly and equally all over, and be sure to make firm the soil round the plants. The usual distances for planting are 18 inches between the plants, and 2 feet from row to row. Should the weather be dry, the plants must be well watered at the roots, then slightly mulched with short dung, and kept clear of runners. Attend to the watering of the forced plants recently set out, should they require it, and pinch off the runners as soon as they appear.

**Miscellaneous.**—Apple and Pear trees in the open quarter had better be examined again, and have all their secondary growths pinched in. The Early Margaret is now ripening its fruits well, and will be allowed to remain on the tree, and gathered as required. Morello Cherries will generally be found ready for bottling purposes, over-ripeness rendering them useless for this purpose. The fruits that are left after gathering for this purpose must be preserved from the attacks of wasps and flies. It is a good plan to set traps composed of bottles partly filled with sour beer and sugar, which should be hung on the walls adjacent to the house, but the surest method for wasps is to find their nests and destroy them. The early varieties of Plums now ripening will require to be looked over daily, gathering the ripest fruits. *A. Ward, Stoke Edith Park.*

*Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.*

## APPOINTMENTS FOR THE WEEK.

### MEETING.

TUESDAY, AUG. 28 { Royal Horticultural Society: Fruit and Floral Committees.

### SHOWS.

WEDNESDAY, AUG. 29—Harpenden and Bishops Stortford.

THURSDAY, AUG. 30—Havick.

FRIDAY, AUG. 31—Sandy.

### SALES.

MONDAY, AUG. 27 { Dutch Bulbs, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, AUG. 28 { Flowering and Imported Orchids, at Protheroe & Morris' Rooms.  
Greenhouse Plants, at the Nursery, High Road, Stamford Hill, by Messrs. Protheroe & Morris.

WEDNESDAY, AUG. 29 { Dutch Bulbs, at Stevens' Rooms.  
New Orchids from Mr. F. Sander, at Protheroe & Morris' Rooms.  
Clearance of Stove and Greenhouse Plants, &c., at Belsfield, Windermere, by Messrs. Protheroe & Morris (two days).

THURSDAY, AUG. 30 { Imported and Established Orchids, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.

FRIDAY, AUG. 31 { Freehold Nursery and other Property in Kingston, by order of the Executors of the late Mr. T. Jackson, at the Mart, London, by Messrs. Protheroe & Morris.

SATURDAY, SEPT. 1 { Imported and Established Orchids, at Protheroe & Morris' Rooms.

{ Dutch Bulbs, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.

The National Co-operative Festival and Flower Show.

THE first so-called Festival of Labour, and the third co-operative flower show, were held at the Crystal Palace last Saturday.

Great interest attaches to this demonstration to working people of their own varied powers of self-help, and which serves to exhibit the progress already made in co-operation. The presence of more than 27,000 visitors may be accepted as a solid proof of the progress already made, and as full of promise for the future.

This is hardly the place to say much about the Festival of Labour, though we yield to none in the pleasure the association of the two ideas affords. Work in many spheres of labour—far removed from trades in which sweating systems have been thought possible—has become far too much of a drudgery, and there are few trades or professions in which the old saw, "All work and no play makes Jack a dull boy," is more frequently verified than in gardening. Now, if this is true of a business which, of necessity, is largely prosecuted in the open air, it is much more so of the majority of those industrial enterprises that are carried on indoors, and many of them in overcrowded and unsanitary workshops.

The exhibition of co-operative products—that is, from workshops in which the operators share in the profits—was contributed to by 150 co-operative societies in England and Scotland, three from France, and one from Italy. That the members of our co-operative industrial societies have taken up horticulture as a source of recreation and profit is one of the most hopeful signs of the times. That the attractions of horticulture were sufficiently strong to hold the industrial classes as with a spell around the horticultural products during the counter attractions of the other most interesting exhibitions in which so many of the visitors had also a deep personal interest, speaks volumes of the hold

that horticulture has already gained over them. Neither can the exhibition of fruits, flowers, and vegetables of last Saturday fail to strengthen the love of horticulture among the masses. Up to quite recently the majority of the working classes have been more or less apt scholars in the utilitarian school of horticulture. Beginning with the poor man's vegetable, the Potato, the greater number of exhibitors seem to have almost perfected its cultivation and gone on to Carrots, Turnips, Onions, Parsnips, Beet, Cabbage, Cauliflowers, Peas, Beans—Broad, French and Runners; but beyond the first three of these vegetables undue diversities of skill and merit become more apparent.

In the classes for vegetables the entries were very numerous:—For a collection of six vegetables, sixty-three entries; thirty-six pods of Peas, one hundred and three entries; thirty pods of Broad Beans, seventy-nine entries; thirty pods of Scarlet Runners, seventy-six entries; thirty pods of dwarf French Beans, eighty entries; six Carrots, one hundred and nine entries; twelve spring-sown Onions, sixty-three entries; six Turnips, seventy-one entries; and so on through the vegetable classes in section 1. The task set the judges was by no means an enviable one.

The fruit exhibition doubtless suffered much alike in extent and quality from the unfavourable season. Here the Gooseberry and Apple occupy a corresponding place to the Potato among the vegetables. Almost every operative with a yard or two of ground aspires to the possession of a Gooseberry bush or an Apple tree—and there was a large display of the former in fine form, and for the season a fair one of Apples. Currants, especially red and black, were also fine, while following in diminished numbers and lowered quality. But superior fruits, such as Pears, Plums, Peaches, Nectarines, Apricots. Figs were generally conspicuous by their absence, to express it in general terms. Doubtless as knowledge grows, taste becomes more cultured, and a larger proportion of the profits of labour remains in the hands of the workers. All these superior fruits may become possible to the industrial classes. Few things would afford such a stimulus to horticulture or effect a more complete and wholly beneficial revolution in the homes and gardens of the working classes than such a wide extension of superior fruit culture as to bring it within reach of all who desire to share its pleasures or participate in its profits.

Flower culture seems to lag behind that of superior fruit among the operatives, not in numbers, perhaps, for in class 33, for six bunches of hardy annuals, there were forty entries; in that for six bunches of Stocks, thirty-two entries; for six Asters, thirty-five entries; a bunch of Sweet Peas, thirty-five entries; and six blooms of Roses, thirty-six entries, and others in proportion. Greater skill and more love, however, seemed to have been put into the Potatoes than into the Roses. Nor is this to be wondered at, for in the struggle for daily bread the stomach has to be satisfied with food before the eye is filled with beauty. The season, distance, inexperience, all told heavily against the exhibition of plants and flowers. Not a few of the exhibitors had also suffered from the vicissitudes of transit. Taking an all-round view of the subject, the industrial flower show was a great experimental success, pointing the way to much higher results in the near future. It would be thrusting the cart before the horse with a vengeance to expect the pursuit of beauty to precede that of utility in the gardening of the masses; so let us have all things

in due order of evolution—thus: vegetables and fruits, flowers, and, finally, a due proportion and tasteful disposition of all. To have opened so many eyes to the perception of beauty—to have incited so many to desire it—is to have set forces in motion that will rest not from their labours till beauty everywhere, in workshop, factory, and mine, ennobles labour, and adds sweetness and restoration to rest. Compared with previous shows this one marked a decided advance, and should this great festival become an annual fixture, there is no doubt it will prove one of the most attractive of the kind held in the country. Great praise is due to the staff, and especially to Mr. W. G. HEAD, for the arrangement of such an enormous number of exhibits in so short a time.

### THE BANYAN TREE (see Supplementary Sheet).

—The Banyan, with its spreading limbs supported by natural props, forms one of the most striking objects in Indian gardens, at least in the hotter parts of that country. Owing to its peculiar mode of growth the tree is rather to be looked on as an aggregate than as a single tree. The offshoots have successively occupied new territory, but they are still in federal union with the main trunk. Marvellous tales have been told of the area covered by these trees—the more marvellous because true. The imagination of MILTON was fired with what he heard of these trees, and his sonorous lines accord well with the majesty of the trees themselves. One of the largest was that in the Royal Gardens, Calcutta, figured in our columns in 1873, p. 1705, where an authentic account, including measurements, was written for us by the late Dr. GEORGE HENDERSON. Roughly, that tree, dating from 1782, covered 1½ acre of ground, but it has since been injured by cyclones. Our present illustration, which well shows the mode of growth of the tree, is from a photograph taken in the garden of Mr. WENZ at Madura, in Southern India.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

—The preparations for the Jubilee Exhibition of this Society, which will be held next June in Windsor Great Park under the presidency of the QUEEN, have already begun, as schedules have been issued for prizes for Hops, jams, and preserved fruits to be competed for at that meeting. The prizes for jams and preserved fruits are of especial interest in view of the fact that fruit growing is a rising national industry, and that the Windsor Exhibition of next year will probably be the first preserved fruit-show on record. There are two sets of prizes—one in which fruit-growers and associations of fruit growers are alone allowed to compete, and the other for manufacturers of jams who are not fruit growers. Classes will be made for jams, fruit jellies, bottled fruit, preserved fruit for dessert purposes, dried or evaporated fruits for cooking purposes, and fruit pulps. In each case the jams or fruits must be prepared exclusively from fruits grown in the United Kingdom in the year 1888. The entries close on December 1 for jams and preserved fruits.

OUR FIELD CROPS.—The acreage of land in Great Britain in 1888 under the following crops is, according to a paper sent us by the Agricultural Department of the Privy Council, as follows:—Wheat, 2,564,010; Barley, 2,085,474; Oats, 2,882,223; Potatoes, 590,123; Hops, 58,509; showing an increased percentage, as compared with 1887, of 10·6 per cent. in the case of Wheat, of 5·4 per cent. in the case of Potatoes. Oats show a decrease of 6·7 per cent. in the same period, and Hops of 8·2 per cent., while Barley remains about the same. In live stock the decrease is general in all classes, except pigs, which show an increase of 4·6 per cent.

NOXIOUS PLANTS.—Farmers in Bedfordshire are at present feeling considerable anxiety in consequence of several horses and other animals having died in a manner which suggests the belief that they

have been poisoned through eating some noxious plant. Suspicion attached to a variety of Crowfoot, which, during the late rains, has largely increased in growth in boggy parts of the meadows. Several specimens of this plant were forwarded to the Botanical Society of the Bedfordshire Natural History Society (Mr. J. HAMSON), who has come to the conclusion that the plant which poisoned the animals is the lesser Spearwort (*Ranunculus flammula*), a very poisonous variety of Crowfoot. It is rather uncommon, but the wet season seems to have been favourable to its development.

**THE GARDENERS' ORPHAN FUND.**—The gardens at Ketton Hall, Stamford, were opened to the public in aid of the above on Monday, August 20, through the kindness of Mr. and Mrs. Horwood. The day was not very promising, but there was a good attendance, and £3 17s. was taken for admission and 2s. 8½d. in collecting boxes, leaving a balance in favour of the Fund of £3 7s. 8½d. after paying expenses of printing and advertising.

**APPLE AND PEAR SHOW.**—The Devonshire Pomological Society has arranged for an Apple and Pear Exhibition to be held in Exeter on October 25 and 26 this year. Schedules are now ready, and can be obtained from the Honorary Secretary.

**CONIFERS.**—Last year the growth of most species of ornamental coniferous trees was much less than usual, owing to the drought and heat, which conducted to the early maturing of the wood. Many weakly trees perished on light dry soil. This year, on the contrary, the growth of shoots has been far in excess of ordinary years, and the heavy rains have contributed greatly to the unwonted health of the trees. We observed recently at Luton Hoo gardens some trees of *Araucaria imbricata* which were threatened with the loss of their lower branches, but which were rapidly recovering vigour, as was observed by the number of new shoots made, by means of surface soiling and heavy root waterings, aided by the rains of June and July. *Cedrus Deodara* severely pruned at the points of the leading branches were breaking densely into new growth, and that without any artificial assistance. By thus pruning the larger branches the damage done by heavy snowfall is greatly lessened, and the appearance of the trees as objects on a lawn much improved.

**SALE OF DEVIZES CASTLE.**—On Tuesday, August 21 Mr. EDWARD TEWSON (Messrs. DEBENHAM, TEWSON, FARMER & BRIDGEWATER) offered for sale, at the Auction Mart, by order of the executors of the late Mr. R. VALENTINE LEACH, the historical freehold estate of Devizes Castle and 120 acres of adjoining ground. Devizes Castle had certainly a unique record from its foundation by Bishop ROGER about 1107, down to the present day, having been in the occupation of eleven Queens of England, and having also in its time sustained an attack from the forces of CROMWELL. The biddings commenced with an offer of £4000, and did not advance beyond £8000, at which sum the estate was declared sold, Mr. TEWSON adding that the figure was not anything like the value of the property, or at all events, what it had cost the late owners.

**CARNATION MRS. REYNOLDS HOLE.**—This very beautiful new Carnation, introduced by Messrs. DICKSONS, of Chester, has been recently awarded a Silver Medal and Diploma at the Antwerp Royal Society of Horticulture and Agriculture.

**DISA GRAMINIFOLIA.**—Mr. BURBIDGE kindly sends us flowers of this pretty species grown at Straffan, Co. Kildare. Its pale blue flowers are arranged in loose racemes. The upper sepal forms a hood as in a Larkspur flower; the lateral sepals are much smaller and reflexed; the lateral petals are concealed within the hood, and seen from the side are like the head and neck of a swan. The projecting lip is elongate, spoon-shaped, slightly inverted at

the deeply fringed reddish-violet edges. The column does not fully coincide with BOLUS's description and figure in vol. xix. of the *Journal of the Linnean Society*, and the lip is deeply fringed. We must leave the Orchid experts to settle these discrepancies. The plant grows on the summit of Table Mountain, flowering in March. Its leaves are radical, linear.

**THE GENUS PRIMULA.**—Dr. FERDINAND PAX has published in ENGLER's *Botanische Jahrbücher* a very elaborate monograph of the genus *Primula*, in which he deals with its history, morphology, anatomical structure, and geographical distribution. About 150 species are enumerated, grouped under several heads, the most important of which are the margins of the young leaves, involute, or revolute, as the case may be. Other characters are derived from the character of the inflorescence, the accrescent or unchanged calyx, the presence or absence of stolons, and the character of the foliage.

**KNIPHOPIA.**—In the garden of Mr. GUMBLETON, in Queenstown, there is a collection of over forty species of this fine genus, from the tiny *K. pallidiflora* from Madagascar, with grassy foliage and white Lily of the Valley-like flowers, to the stately *K. Northiana*.

**CYPRIPEDIUM BELLATULUM.**—M. GODEFROY states in the *Orchidophile* that the plant recently exhibited under this name is none other than the original *C. Godefroyi*, and that there is a tendency to call the bad forms of *C. bellatulum*, *Godefroyi*, while the good forms of *Godefroyi* are called *bellatulum*.

**LILIUM SPECIOSUM.**—Mr. JENKINS sends us buds of two varieties of this Lily called respectively album *Krætzleri* and album novum. Several examples of both varieties expanded under glass on July 30. The two varieties seem practically identical, with the exception that the *Krætzleri* has rich orange-brown anthers, while the album novum has yellow anthers. We take the names as we find them, but deprecate the application of Latin names to such minor variations.

**THE DOUGLAS FIR.**—Baron VON TUBERT has recently described a fungus in the shape of a species of *Botrytis*, which causes great disfigurement of the foliage and young shoots of the Douglas Fir.

**CONIFEROUS PLANT SECRETIONS.**—The secretion in Conifers is a resin mixed with an essential oil. MM. HECKEL and SCHLAGENHAUFEN find an exception in the case of the *Araucaria*, which secrete not resin, or oleo-resin, but gum resin.

**COLD STORAGE OF FRUIT.**—Although for several years now meat, game, &c., has been successfully preserved by cold storage, or freezing, yet until the present time we believe that no organised effort has been made in this country to apply the same treatment to fruits. The Royal Horticultural Society, as announced in our last issue, has appointed a strong committee for the purpose of investigating the effects of refrigerating fruit with a view to its preservation, and also to conduct experiments as to the best mode of procedure, thus connecting itself with the commercial interests of horticulture. The Leadenhall Cold Storage Company, with whom the Society is working in these investigations, has commodious chambers below the market, and it is in these chambers that the subjects on trial will be deposited. On a recent visit to these stores we were enabled, by the courtesy of Mr. D. TALLERMAN, to inspect the system of working which is known as the "De la Vergue System," and consists of allowing anhydrous liquid ammonia under great pressure to enter into pipes from which the air has been exhausted; the ammonia expands and assumes a gaseous condition extracting heat from the pipes which are conducted round the chambers, they in their turn abstracting the heat from the air of the room; and so a very low

temperature may be maintained and regulated at will. One room had been cooled down to 38° F., another to 25°, and one even so low as 22°, in which condition it is found that the bodies of birds can be preserved for twelve months. It is not desirable that we should enter into detail concerning several samples of Cherries which were shown (and which had been in only ten days), as the methods are not yet tested, but appearances point to success. This will have a very important bearing on fruit growing, and on our fruit markets, for if Cherries, Strawberries, Plums, and other fruits can be preserved fresh till Christmastime, the fruit grower with a surplus stock can freeze those not required for present use; but it yet remains to be seen in what way this will affect prices.

**ADELAIDE.**—Dr. SCHOMBURGK's Report on the Botanic Garden for the year 1887 is jubilant over the rainfall, which amounted to 257 inches instead of 144 during the previous year. The highest temperature in the shade for 1887 was 111°·2, in the sun 164°. Vegetation, both on the farm and in the garden, thrive under these auspices. The insect powder plant, *Pyrethrum cinerariaefolium*, does well in South Australia, and may become one of its bye products. The garden and its dependencies are in a highly satisfactory condition, and much appreciated by the public.

**THE YORK GALA: RETIREMENT OF MR. JOHN WILSON.**—Mr. WILSON, who for the long period of thirty years has so well filled the office of Secretary to the above, and to whose excellent management so much of the success attending the annual *fete* is due, has resigned that post, to the great regret of the supporters of this popular horticultural festival. Mr. WILSON has been officially connected with the *fete* from the very first, and he has held the secretaryship without intermission. That he will be greatly missed there will be no doubt, for his keen business tact, mastery of detail, and invariable courteous demeanour, inspired confidence alike among supporters and exhibitors. It will not be easy to find so capable a successor. Mr. WILSON is retiring altogether from the various offices of trust he has so long held in the city of York, and let it be added, filled with such advantage to his fellow-citizens. It is his intention to reside for the future near London, and hearty good wishes from a very large circle of friends will follow him into his well-earned retirement.

**NOVA SCOTIA APPLES.**—We learn from the official report that Apple orchards are annually extending in the colony, the area occupied this year being:—In King's County 143, as against the average of 100 in preceding years; in Annapolis, 118. But, whilst these are the two principal counties in which fruit is raised for export, we find other counties making headway in orchard culture: Guysborough, 105; Digby, 107; Cumberland, 110; Colchester and Hants, 117; Yarmouth, 120; Pictou, 122. Antigonish, Cape Breton, Halifax, Inverness, Lunenburg, Queens and Victoria maintains the average. The Apple orchard area for the whole province seems from the returns to have increased almost 10 per cent. within the year. This year the Apple orchards blossomed abundantly, more so than usual, but there are complaints of want of setting attributable to the cold, dry season. The trees suffered also from caterpillars. There is prospect of fair fruit crops, however. The following percentages of probable yield of the leading market kinds are from the returns of the principal fruit districts of Annapolis and Kings Counties:—Gravenstein, 75 per cent. over 100, 125, over 100, 110; Yellow Bellefleur, 75 per cent., 100; King of Tompkins, 75 per cent., 125, 65; R. I. Greening, 100 per cent., 100, 125; Ribston Pippin, 100 per cent., 100; Northern Spy, 60 per cent., 100; Vandevere, 60 per cent., 60; Golden Russet, 50 per cent., 90, 105; Nonpareil, 30 per cent., 40, 75, 105; Baldwin, 60 per cent., 125, 50.

## THE APIARY.

The question agitating many is whether it is profitable to keep bees, or to take arms against a sea of troubles (to wit a soaking summer), and by sulphuring end them—that, is, the bees. As the rain poured down pitilessly day after day I was led to these thoughts, but still I did not harbour them long, remembering that a season like the present seems to come about once in nine years; and though the eight intervening seasons are only about half of them of much account, yet, taking all things into account, bee-keeping is profitable if pursued industriously and intelligently; and he who knows how to transfer his accounts to the folio of a ledger will soon find that the balance keeps on the encouraging side of the said ledger.

After this preamble, and before proceeding, I must just say, "Feed, feed, feed!" If it does not pay to feed bees, it certainly does not pay to starve them, leaving humanity out of the question. A very pretty little glass section comes to me from Swanwick, Alfreton. It is made of glass everywhere, except that the pieces of glass are ingeniously fastened on little pieces of wood. The wood acts as a non-conductor, and so the greatest objection to glass supers—the loss of heat—is obviated. The foundation is cleverly fastened in, and the honeycomb, when completed in these sections, would look very nice at a show or on the dinner-table. Money ought to fetch a good price this season. Of course the bees are getting in a little now, but in my own apiary the bees will require it themselves, and it will be fortunate if they get enough for themselves. However, I am thankful that my hives are not to be seen floating down a river, as some people's haycocks were a little while ago. It is always a good thing to let the bees have a nice quiet time before winter sets in, and as the bees are now getting in a little it would be advisable to let them alone while the weather is fairly warm, say, till the end of August. But after that matters had better not be delayed, and hives must be examined to see, first, if the queen is all right; and second, if they have enough to eat. They ought, at least, to have 20 lb. of sealed honey, and 25 lb. is not too much of a stretch of generosity. I hear Mr. Hooker has brought out a new work on bees. It has not yet found its way to my study table, but when it does I shall read, mark, and learn it, as I know he is a beekeeper of great experience. *Bee.*

## ENTOMOLOGY.

### THE DEVIL'S COACH-HORSE, OR FOETID ROVE BEETLE.

In the *Gardeners' Chronicle* for November 5, 1842, was published an article by Mr. Curtis ("Ruricola") on an insect which is commonly known by the first of these well-known names, whilst the writer preferred to give it the second name quoted above, accompanied by a very characteristic woodcut, which we here reproduce (fig. 26, lower portion). It is scientifically known as *Ocyptus* or *Goerius olens*, and is by no means a rare insect, and deserves, notwithstanding its savage appearance, protection by the gardener, instead of its ordinary fate of being trodden upon and destroyed when found running about the garden walks, or when turned up by the spade. Its jet-black colour, bold appearance when showing its pugnacious character, raised upon its outstretched legs, with its sickle-shaped jaws widely opened, and its tail turned upwards over its back, terminated by two small white tubercles, which it protrudes, adding to its curious demeanour, which are omitted in the figure given by "Ruricola." The outline figure on the lower right side of the woodcut (fig. 26) represents the under side of the head of the insect, armed on each side with a strong bristle (2). The strong horny jaws or mandibles are represented at 3, the feelers or palpi of the lower jaws and lower lip are shown at 4, and the antennæ

at 5. Godartius figured one of these insects, and gave two very characteristic figures of the larvæ, noticing in his quaint style the voracity of both. Swammerdam also mentions the *Staphylinus* (to which Linnaeus genus the insect belongs), adding that it seems to be of a middle nature between the beetle and the Scolopendra, and it can very quickly kill earthworms with its teeth, and afterwards suck them.

At the end of last June we received a note from a correspondent respecting a centipede-like insect 1 inch or so long, which attacked a worm 4 or 5 inches long, tearing it so that it speedily died. The description given of the insect satisfactorily showed it to be the larva of the *Goerius olens*, being about 1-6th or 1-8th of an inch thick towards the head, and tapering to the tail, being about 1½ inch long.

In the accompanying woodcut (fig. 26) we have represented the larva of the *Goerius olens* of the natural size, the small detached figure showing the position of the groups of eyelets (ocelli), of which there are two, each containing four small ones. The middle figure represents the under side of the head of the larvæ, given in order to show the comparison of the parts of the mouth with those of the perfect beetle represented by "Ruricola." The mandibles (a) are very sharp at the tips, the inner edge wanting the horny small teeth of the imago; the palpi of the lower jaws (c) arise from an elongated basal piece, which is attached by means of several pieces soldered to the under side of the skull, whilst the lower lip (d) is composed of several pieces, and is terminated by a slender porrected point, with two short lateral palpi arising from a dilated piece or labium. The antennæ are shown at e, and one is entirely detached, and represented on the upper left-hand side of the woodcut. The body of the larva is long, and gradually decreases in width to the extremity; it is comparatively soft and fleshy, and clothed with numerous fine hairs. It is terminated by a short deflexed tubular joint, which serves as a seventh leg, and which is defended at the sides by two long slender setose two-jointed filaments, as shown in the right-hand figure. Although this larva is as voracious it is by no means so ferocious-looking as the perfect insect.

"Ruricola" describes the habit of the perfect insect, especially noticing that one which he had placed under a tumbler killed and had eaten six earwigs in an hour and a half. *I. O. W.*

## FORESTRY.

**PLANTING PREPARATIONS.**—During the month of August, when but few special operations demand the attention of the forester, every effort should be made to push forward the preparations of land to be planted during the autumn and winter, attention to drainage taking the precedence of other operations, this being followed up by fencing and pitting. Upon clay soils summer and autumn operation are most beneficial, but the amount of good connected with such timely work, even on light sandy land, is everywhere discernible. Pitting at least should never, unless under very peculiar circumstances, be delayed until the planting season, for the ameliorating effects of frost, sun, heat, and air leave the generality of soils in the best condition for planting.

**The Nursery.**—A sharp outlook must now be kept on Coniferous trees for insects and their larvæ. Usually about this time these pests begin their depredations, and, what is most provoking, they usually choose the leading shoots for their boring operations. Few Conifers come amiss to these boring beetles, even the Corsican Pine, which was once considered to be insect-proof, being destroyed in large numbers in plantations where they are freely mixed up with Scotch, Austrian, and Weymouth Pines.

Recently grafted trees should be examined, and the ties slackened, or wholly removed, as may be found necessary. Remove all superfluous twigs from the stems of young hardwoods, and buds and shoots from the stocks of grafted trees and shrubs. I have found it necessary to lighten the heads of many hardwood trees during the present season, their growth being out of all proportion to the size of the stems. To young and recently planted specimens we are now directly referring.

**Ornamental Trees.**—Park trees will require attention to see that broken branches are cut off and removed, as well as such as have been browsed by stock, are trimmed up neatly. *A. D. Webster, Holwood, Bromley.*

## FRUITS UNDER GLASS.

**PEACHES.**—Assuming that growth on the trees in the early house has ceased for some time, the wood is hard and brown, and the buds plump, let no time be lost in removing all superfluous growth, and place the bearing wood under the best conditions for getting thorough exposure to the sun. Syringe the trees heavily every afternoon, and see that the state of the soil is right as regards moisture. Where heavy syringing is going on, the border often appears to be wet on the surface, while the soil about the roots is in a too dry condition.

**Succession Houses.**—Trees from which the fruits are cleared must have every attention, especially in such a cold sunless season as the present. Remove every shoot which is not required, and let the fruiting wood of next year be trained thinly over the trellises. Six to 8 inches is not too far apart if the length of the foliage be taken into consideration, which on healthy trees will run to 8 in length. If the wood be still green and sappy, a little heat in the apparatus will do much to thoroughly mature it. Syringe daily to keep red-spider in check, and attend to the watering of the borders. Where the trees are aged, weak manure-water will be of benefit.

**Late Houses.**—In the absence of sun-heat, it will be advantageous to afford a little fire-heat, making the pipes merely warm, and afford abundance of air. Where the fruits are colouring, the trees should not have any water at the roots, and syringing should be discontinued. Late Peach trees swelling their fruit will also be benefited by artificial warmth, as the thermometer sinks sometimes to 39° during the night; fully expose the fruit, and keep the young shoots closely tied in. Syringe on all favourable occasions, except during cold days, especially if the house be unheated. A cool and moist condition of the air in a house favours the appearance of mildew.

**Figs.**—The earliest trees for forcing next season should now be in a forward state of maturity; therefore give every attention to watering and syringing the plants until the foliage falls naturally. The trees, when the wood is matured, may be stood out-of-doors in a sunny sheltered situation, until the first appearance of frost, keeping them clear of the ground by placing a brick under each corner of the tub. To successive trees maturing their second crop of fruit, weak stimulants may be afforded; the syringe must not be too freely used or the fruit will be liable to split prematurely. Maintain a good circulation of warm air in the house. Remove all weak useless growth, also any fruits which show upon the shoots. *W. M. Baillie, Luton Hoo Gardens.*

## THE KITCHEN GARDEN.

**Cauliflowers.**—Seed should now be sown on a warm border, the young plants to be removed later to handlights and cold frames to stand the winter. Most gardeners are anxious to have Cauliflowers ready in spring as soon as the Broccoli is over. In doing this find no difficulty when I grow Gilbert's Victoria Broccoli for the latest successional variety, with Early London Cauliflower to succeed this. As a later crop it is well to employ the variety called Asiatic Cauliflower. Autumn Giant (sown now) will succeed this one, but in some seasons it is very apt to go blind in the spring after planting out: in others it produces capital heads. To follow this Eclipse and Autumn Giant, both sown in spring, carry on the season until Veitch's Self-protecting Autumn Broccoli is ready, which is followed in due course by the varieties recommended in previous numbers.

**Lettuces.**—The main supply for early spring use should now be sown, and for this purpose none are so good as the old Bath or Brown Cos for use in private gardens. Some market growers and others object to the colour of this variety, and prefer Hick's Hardy White. It is well to sow a little of Paris Market or Perfect Gem Cabbage Lettuce at the same time as the above. They are often ready for use much earlier in the spring, and also take up

only a very small space; it is best to sow on a south border, as the plants left in the seed bed will often survive the winter, and be found very useful for filling up vacancies.

**Early Potatoes.**—The Potato disease is spreading among these, and any Ashleafs that are now undug should be taken up on a dry day, and after being dried should be stored in small lots in a cool place, covering them so as to exclude the light. Tubers kept for planting should be spread out thinly in a dry and well ventilated frost-proof shed. *W. H. Divers, Ketton Hall, Stamford.*

## HOME CORRESPONDENCE.

**GRAPES IN BAD CONDITION.**—I send for your inspection a bunch of Muscat of Alexandria, and one of Madresfield Court Grapes. Since I took charge three years ago the Vines have been very much subject to both shanking and scalding. Two years ago I determined to see what the border was like, so I took away the old soil down to about 2½ feet, when I came to a few roots in a very unsatisfactory condition, having entered into a sour ungenial soil. Before beginning at the border I had ready a suitable compost of good turfy loam, well-decayed manure, and lime rubbish, and having got down below most of the roots, I bedded in this material, and gave the Vines a good mulching of well-decayed manure. The inside border being served in the same way, they were started very gently on March 1, came away very slowly, and made sickly growth, showed few bunches at the colouring stage, and shanked very badly. Seeing the old canes were to be a failure, I encouraged young ones from the bottom of each Vine, which made excellent growth to the top of the house. At pruning time they were cut down to within 3½ feet from the bottom. Previous to starting last spring I made an examination of the border outside, and found it full of healthy young roots, and giving it a good mulching I proceeded to the inside border, and found it in the same condition; having given it a good top-dressing I left both, thinking they were all right. They were started at the same time as they had been the previous season. The old Vines made sickly growth as usual, but the young ones made luxuriant growth as they had done the previous season. The old canes never showed a bunch, but the young Vines produced excellent bunches, but set badly, the temperature at the time being kept from 70°—72°, with a little air on night and day; since then the glass has never been much below 70°, with plenty of air on all favourable occasions. Now, seeing that the young Vines are making such fine growth, and yet shank fully as badly as did the old Vines, I fail to understand the reason. The old Vines will be cut away next spring, to be replaced by the young canes. They were at first planted at 3½ feet apart, but by the introduction of the young Vines are only the half of that distance now. As regards Madresfield Court, for two years back the leaves have assumed the same colour as represented, and always about the same time (colouring stage), and the bunches never ripen any further; this year the young canes show the same tendency. As to watering, the outside border has been watered three times during the season, each time every Vine got 144 gallons of water, the inside border rather more than that, and liquid manure was also given. Now I think I have explained matters as well as I can. I shall be much obliged if any reader can give any light on the subject. Of course it is too late to do anything for this season to prevent the malady. Shall I clear out the border right to the bottom, or shall I wait for another season and give them an extra supply of water? I know the outside border gets dry very quickly, as it stands on rather high ground. *J. C.*

**THE CATALPA.**—Commenting on the above (p. 198) your correspondent John Colebrook says:—"I have not seen more than half-a-dozen of these trees in England during the last twenty years." If he will take a walk from Blackfriars Bridge westward he will be able to feast his eye on many of his favourites, some of which are being remarkable well. In a corner of the Temple Gardens will be found one of the finest in London, at present covered with bloom-buds just bursting into flower. Further on, the Embankment Gardens (opposite the National Liberal Club) can boast of several, and on reaching the Palace Yard a row of half-a-dozen will gladden his eyes, looking beautifully green and cool with no

other tree for contrast; then onwards, to Battersea Park, where, planted in the border that has the river for its front, many will be found, giving one the impression that in the race for life the Catalpa will have to give way to its stronger brethren. *G. B.* [The Catalpa is an excellent, town tree, difficult to kill. *Ed.*]

**MINA LOBATA AS A CONSERVATORY PLANT.**—This pretty trailing half-hardy annual, which flowers very freely in quite a small state, may be grown in pots for conservatory decoration during the summer months, and is a welcome addition in variety at this time of year. From seeds sown early in March we now have plants, in pots varying from 5 inches to 10 inch sizes, flowering freely. Good turfy loam and one-third leaf-mould suits them well, and grown in pots of the above sizes, with one centre stake, or three round the sides of the pots, the plants carelessly tied, they make a variety among flowering plants. The flowers are produced on double racemes, standing erect and well out of the dark green foliage. The buds are of a reddish-orange colour, and yellowish-white when expanded. The flowers open in succession from the base of the raceme, and have a pretty appearance, also lasting well in water when

FIG. 26.—STAPHYLINUS: DEVIL'S COACH HORSE, LARVA AND PERFECT INSECT.

cut. The plant is also adapted for covering bare walls, &c., growing quickly and flowering freely in a warm position. *C. Herrin.*

**ASTERS AT CHISWICK.**—Admirers of the annual Aster generally, and the Royal Horticultural Society in particular, are indebted to various seedsmen for a large and most interesting trial of this very beautiful autumn flower, which is just now about at its best at Chiswick. The trial is especially rich in dwarf kinds, and still further is evidenced the wondrous wealth of variety in Asters—so much so, in fact, as to be like to so many other favorite flowers, almost bewildering. Happily the trial opens an effective way out of the perplexity, because it shows quite as literally what sorts to avoid as what to select; and assuming that those interested can always obtain true to character the kinds selected, they will have great cause to rejoice that such a favourable chance to assist in the survival of the fittest was presented. Whilst we see in the collection of Asters some sorts so beautiful as well as true that they command our warmest admiration; we may also well wonder why

the Continental growers should trouble to select and put into commerce many others, pretty enough perhaps alone, but which look poor indeed when compared with the finer or more beautiful forms close by. The exceeding variety of dwarf Asters, which may here be seen, should attract the grower of these flowers for market purpose, as many of the newer forms are so even in character, and so beautiful a to merits wide cultivation. It is very pleasant indeed to find that, while Chiswick seems to be so indifferently regarded by the authorities, yet it is doing such useful and instructive work. All who may journey to the gardens to see the Asters as well as the Tomatos, will be amply repaid for their trouble. *A.*

**THE HEDGEHOG'S CRY** (p. 189).—"It has been remarked that when the feet of the animal are pinched it usually utters a shrill scream. But the barbarity of anatomists has proved that hedgehog's may even be dissected alive without their emitting any sounds of distress whatever" (Bingley's *British Quadrupeds*, 1809, p. 238). *H. Ellacombe.*

Two years last December while trimming hedges we found in a nest of leaves and rubbish a female hedgehog with five little ones. It being very frosty I had them put in the kitchen, and the children made great pets of them. They were fed on milk and were wonderfully lively and tame. They all, but chiefly the little ones, whistled a great deal at all times but mostly at night, a long-drawn whistle something like a guinea-pig's but much more intense. One day the old mother disappeared and the little ones died one after the other in spite of all the care bestowed on them. Some weeks after some boys in my employment while lighting a fire in a bunching-room, which is not very far from the kitchen, were startled by some unearthly cry—like a child's cry, as they all expressed themselves—from down the chimney, and presently down came the lost old hedgehog all ablaze. They put her in a pail of cold water to extinguish the burning bristles, and I had her put in the barn afterwards, as she did not seem to be any the worse for the accident but very anxious to escape from further petting and confinement. So it seems our friend the hedgehog is not only efficient in whistling, but can give vent to its feelings in a peculiar manner when in extreme pain. *G. Wernig.*

—Whatever White, of Selbourne, or Bell, or other naturalists have or have not done, Shakespeare—with whom my namesake, Dick Burbidge, was familiar as a friend—certainly alludes to the hedgehog's cry. It is in "*The Tragedy of Macbeth, actus quartus, scena prima*." Thunder. Enter the Three Witches." (First folio edition).—

- "1. Thrice the brinded cat hath mew'd.
2. Thrice and once the hedge-pigge whin'd."

These pretty and harmless little animals are very abundant in the Midland Counties, and are there often called "urchins," also a not uncommon name for a mischief-loving boy. Elves and fairies were also supposed to appear in the form of urchins or hedgehogs, and Shakespeare's allusions to the animal (for he has one other at least) must be read in this light. The hedgehog is reputed to be excellent food, something like young rabbit, and as a boy I often heard legends of the gipsies cooking them by rolling the animal, skin and all, in clay, and then baking them in the ashes of their camp fires. *F. W. Burbidge.* [Every one cites this legend. We suspect it to be as factitious as the alleged barbarity of the anatomist and the silence of the urchin under such circumstances. *Ed.*]

**THE POTATO CROP REPORTS.**—I quite concur with your correspondent "A. D." viz., that these reports are made out fully a fortnight or three weeks too early. Up to August 6 never do I remember seeing the Potato-tops look better or more promising for a good yield, while in less than a week from that date there was not a top that was not blackened by the fatal disease. I found the first signs of disease on July 30. The disease spread very slowly from that date up to August 6, when the weather became much warmer, and then it propagated itself with great rapidity; and now (August 20) every Potato plot in gardens and fields in this neighbourhood is infected—indeed, much of the haulm on smaller patches has been cut off and taken away. The American varieties have suffered the worst. If Mr. Jensen's theory be correct, viz., that the rain washes the spores through the soil to the tubers, we should have but very few diseased tubers (where the haulm has been cleared

away, as we have had no rain since the Peronospora began to spread so fast. From my own observations, and the experiments I have made and am making, I am inclined to think that Mr. Jensen is right. If he is not, the question might well be asked, Do the tubers become as much affected during dry weather (providing there is the same amount of disease on the haulm) as they do when there is sufficient rain to wash the disease spores to the tubers? J. H.

**THE WEATHER.**—We are having a very cold summer in this part. On August 15 the thermometer registered 32° on the grass; the minimum in the screen close by at 4½ feet above the surface of the ground was 37°. Since that date a very cold N.E. wind has prevailed, which makes the temperature feel more like the February than August. Harvest has begun in this part (August 18), and crops will be good in quantity if the weather remain favourable. Late Potatoes look remarkably well, and are at present free from disease, but not so the early and second early varieties. Some of the Apples and Pears grow very slowly and require warm, dry weather. *W. H. Divers, Ketton Hall, Stamford.*

As a proof of the prevailing low temperature, I may mention that on the 19th inst., our thermometer at 3 feet from the ground registered 1° of frost. *Y. Y. Bowie, Weeting Hall, Brandon, Norfolk.*

## SOCIETIES.

### READING HORTICULTURAL.

**AUGUST 15.**—This was one of the best exhibitions held at Reading for some years, and it took place, as usual, in the Abbey Gardens.

**Stove and Greenhouse Plants.**—The best collection of nine kinds came from Mr. J. F. Mould, nurseryman, Devizes, who had fresh examples of *Gloriosa superba*, *Clerodendron Balfourianum*, *Erica retorta* major, *E. Iriyana*, *Allamanda Hendersoni*, &c. Mr. A. J. nurseryman, Lower Norwood, would have been 2nd, but owing to his not observing one of the requirements of the schedule, by staging three *Ericas*, he was disqualified; but he was awarded an extra prize nearly equal to the amount of the 2nd prize. Mr. Mould had the best flowered specimen, staging a good piece of *Erica obtata purpurea*; Mr. Bright, gr. to R. Karslake, Esq., White Knights, being 2nd, with a fine specimen *Fuchsia*.

The best new or rare plant was a good one of *Schubertia grandiflora*, shown by Mr. Woolford, gr. to A. Palmer, Esq., Reading; Mr. Dockerill, gr. to G. W. Palmer, Esq., Reading, being 2nd, with a well grown and coloured *Dracena Lindenii*.

**Miscellaneous Flowering Plants.**—The best group of six *Achimenes* came from Mr. House, gr. to J. O. Taylor, Esq., Reading. Mr. Bright had the best four *Fuchsias*, staging freely grown and flowered pyramidal specimens. Some very good *Cockscombs* came from Mr. Bowerman, gr. to C. Hoare, Esq., Hackwood Park.

Bedding *Palæmoniums* were well shown by Mr. Woolford; Mr. Bright being a good 2nd. Mr. Woolford also had some admirable examples of tuberous-rooted *Begonias*, grandly grown and carrying blooms of high quality. They promise to become exhibition plants of the future. Mr. Dockerill was well up for 2nd place.

**Groups arranged for effect.**—Since exhibitions at Reading have followed the semicircular instead of the oblong form, the groups have decidedly improved in appearance. Mr. J. James was 1st with a very tasteful arrangement; Mr. G. Phippen, nurseryman, Reading, was 2nd.

**Foliage Plants.**—The best six, and a very good lot too, came from Mr. Curry, gr. to Colonel Pepper, Salisbury, who had *Crotons*, *Countess*, *Queen Victoria*, and *Weismannii*. *Kentia australis*, *K. Fosteriana*, and *Latania borbonica*; 2nd, Mr. Howe, The Gardens, Bereham Park, Newbury, who had a very good lot also, consisting of *Alocasia macrorrhiza variegata*, *A. Thibautiana*, very fine; *Latania borbonica*, *Phyllostemonium Lindenii*, *Croton Reiffertianus*, and *Anthurium crystallinum*.

Mr. Howe had the best three *Palms*, having well grown and even specimens of *Phoenixophorum seckellarum*, *Areca Verschaffeltii*, and *Kentia Fosteriana*; 2nd, Mr. James, who had a fine piece of *Kentia Lindenii*.

**Ferns.**—The best six stove and greenhouse Ferns came from Mr. Dockerill, who had *Dicksonia antarctica*, *Leucostegia immersa*, *Alsophila australis*,

*Microlepia hirta cristata*, *Adiantum Farleyense*, and *Nephrolepis exaltata*.

**Cut Flowers.**—Roses were a leading feature. The best eighteen came from Messrs. Perkins & Son, nurserymen, Coventry, a very nice fresh lot; Messrs J. Cheal & Sons, nurserymen, Crawley, being 2nd. Mr. T. Turton, gr. to J. Hargreaves, Esq., Marden Eleigh had the best twelve.

The best six blooms of any one Rose was Paul Jamin, from Messrs. Perkins & Son, Coventry; Mr. J. Walker, Thame, coming 2nd, with Marie Verdier.

Mr. John Walker, Thame, had the best eighteen *Dahlias*, a very good lot of blooms for the season. Mr. Walker also had the best twelve. Messrs. J. Cheal & Son were 1st with twelve bunches of single *Dahlias*, and they were the leading features of the show—set up in bunches of ten blooms each of twelve varieties, on Messrs. Cheal & Son's registered wire frame, which displays the bloom to the best advantage.

Mr. Walker was 1st, with German and French *Asters*, showing very good blooms for the season.

The class for eighteen bunches of cut flowers brought a very fine lot indeed from Mr. Phippen, large bunches of such things as *Tuberose*, *Lapageria rosea*, *Yucca gloriosa*, *Harpallium rigidum*, *Lilium auratum*, *Hydrangea paniculata*, &c. In the class for six bunches there was a very keen competition. Mr. Durman, gr. to J. W. Workman, Esq., Reading, was 1st.

**First-class Certificates of Merit** were awarded to Mr. Charles Turner, Royal Nursery, Slough, for yellow ground *Picotées*, *Agnes Chambers*, *Almira*, *Annie Douglas*, *Colonial Beauty*, *Dorothy*, and *Terra Cotta*; and to Messrs. J. Cheal & Son, for single *Dahlia Victoria*, white, with side margins of bright scarlet, a charming and distinct variety.

**Table Decorations.**—These are always extremely well done at Reading, although the prizes are small. Miss Phillips, a constant exhibitor was 1st, with three pieces arranged with excellent taste.

**Miscellaneous Contributions.**—Messrs. Veitch & Sons, Exotic Nurseries, supplied a valuable contribution in the way of ten boxes of cut *Roses*; and Messrs. C. Henwood, C. Phillips, and Mr. L. Walker exhibited each a dozen *Carnations* and the same number of *Picotées*, with which they had taken honours at Oxford the day previous. Mr. Baskett had six large pot Vines, grown and fruited in an admirable manner. Messrs. Perkins & Son also had boxes of cut *Roses*.

**Fruit.**—This was not up to the usual mark at Reading, either in quality or quantity. There was but one collection of eight dishes of fruit, which came from Mr. Goodman, gr. to C. Hammersley, Esq., Bourne End; this consisted of Black Hamburg and Muscat of Alexandria Grapes, Bellegrape Peaches, Lord Napier Nectarines, Hems Kirk Apricots, Kirke's Plum, Figs and Melons. It was also awarded the special prize offered by Messrs. Oakshot & Millard for the best collection of fruit in the show. Mr. Maher, gr. to A. Waterhouse, Esq., Yatenden, had the best six dishes. The best three bunches of Black Hamburg Grapes came from Mr. Osman, gr. to T. Baker, Esq., Ottershaw Park; Mr. Waite, Glenhurst, Esher, being 2nd. Mr. Maher also had the best three bunches of white Muscats, Mr. Ashby, gr. to Mr. Farnin, Whitechurch, being 2nd. Mr. Maher was 1st with any other white staging very good Buckland Sweetwater; Mr. N. Kneller, The Gardens, Malsanger Basingstoke, being 2nd with the same. The best dish of Peaches was the Nectarine Peach from Mr. Pound, gr. to G. May, Esq., Reading; Mr. Mortimer coming 2nd with Late Admirable. The best dish of Nectarines was Lord Napier, from Mr. Goodman; and Mr. Bowerman, of Hackwood Park, coming 2nd with Humboldt. Apricots were poor, Figs fairly good. The best three dishes of Plums came from Mr. Goodman, who had Oulin's Golden Gage, Yellow Imperatrice, and Kirke's. The other collections were disqualified, one variety doing duty for two dishes in each case. Apples, dessert and culinary, and Pears, dessert and stewing, were poor.

**Vegetables.**—These were a great feature, and their high quality commanded general admiration, the competition being very keen in all the classes, and the collections covered a great breadth of table.

**Special Prizes.**—Messrs. Sutton & Sons, Reading, offered prizes for the best collection of six varieties of vegetables, to include certain of their novelties, and here Mr. N. Kneller, gr. to W. S. Portal, Esq., Malsanger Park, Basingstoke, was 1st, with a superb lot, consisting of Snowdrop Potatoes, Onions,

Perfection Tomatoes, New Red Intermediate Carrot, Peas, and Cauliflowers; 2nd, Mr. Waite, gr. to the Hon. Colonel Talbot, Esher, with Satisfaction Potatoes, Duke of Albany Peas, White Leviathan Onions, &c. This firm also offered special prizes in two classes for Potatoes; in one of these—that for a dish each of seven specified varieties—Mr. Holt, gr. to Major Allfrey, Wokefield Park, was a good 1st, with very fine examples of Early White Kidney, Sutton's Seedling, Early Market, Satisfaction, Best of All, Masterpiece, and Abundance; 2nd, Mr. Pope, gr. to the Earl of Carnarvon, Highclere, with a very good collection also. In the class for nine varieties selected from certain specified sorts, Mr. Pope was 1st, with very fine examples of Lady Truscott, Reading Russet, Early Regent, Satisfaction, First and Best, Prizetaker, Woodstock Kidney, Reading Ruby, and Abundance; 2nd, Mr. Stott—a remarkably good 2nd, Woodstock Kidney, Satisfaction, and Reading Russet being remarkably fine.

Messrs. Carter & Co., Holborn, also offered prizes for nine dishes of vegetables. Mr. W. H. Kingsmill, Sydington Court, Newbury (gr. to Mr. R. Lye), being 1st, and Mr. Beckett, Cold Ash, Amersham, 2nd. The vegetables were very fine in this class, but owing to an oversight particulars cannot be furnished.

Mr. C. Fidler, seedsman, Reading, offered prizes for six dishes of Potatoes, Mr. Pope being 1st with a fine lot, consisting of Reading Giant, Clipper, Reading Ruby, Early Gem, Prizetaker, and Snowdrop; 2nd, Mr. Beckett, with Early Gem, Beauty of Hebron, Clipper, Edgemoor Purple, Fidler's Prolific, and Blanchard. Mr. Fidler's prizes for six dishes of vegetables were won by Mr. Pope, who was 1st, and Mr. Beckett, 2nd. Messrs. Webb & Sons, seedsman, Stourbridge, also offered prizes for six dishes of vegetables, Mr. Pope being 1st, and Mr. Waite, Glenhurst, Surrey, 2nd.

### MAIDENHEAD HORTICULTURAL.

The tenth annual show of the Maidenhead Horticultural Society was held on the 16th inst. in the pretty and appropriate grounds of Ray Lodge, and resulted in a very fine display of garden produce. Specimen plants were not largely represented, but groups for effect and smaller plants were staged in fine condition. Miscellaneous exhibits of a non-competitive nature helped very much to brighten and fill up the two large marquees; several handsome collections of cut flowers and plants being contributed by various nurserymen and seedsmen. Vegetables were staged in good condition, and the competition was strong; Potatoes were quite an imposing display, although traces of disease were apparent in a few tubers.

**Plants.**—The first-class—that for eighteen foliage plants—was not strongly contested, two collections only being staged in which Mr. T. Lockie, gr. to G. O. Fitzgerald, Esq., Oakley Court, Windsor, was a very easy 1st, with a clean and well-coloured lot of half-specimens, including *Crotons* *Queen Victoria* and *Weismannii*, *Kentia Fosteriana*, *Dracena Shepherdii*, and *Asparagus plumosus*.

For six stove and greenhouse plants, half to be in flower, Mr. J. F. Mould, nurseryman, Pewsey, Wilts, was 1st with *Kentia Fosteriana*, *Cycas revoluta*, *Allamanda Hendersoni*, and *Erica Iriyana* among his best plants; 2nd, Mr. Aitken, gr. to Mrs. Meeking, Richings Park, Slough, who staged a fine *Kentia australis*, and *Croton Johannis*.

For a single specimen flowering plant, Mr. J. Hanch, gr. to J. J. Weatherly, Esq., Melworth Lodge, Cookham, gained the leading position with large and profusely bloomed *Eucharis amzonica*; Mr. Aitken 2nd, with *Allamanda Schottii*.

In a similar class for a foliage plant the competition was keen, and some good plants were staged. Mr. Aitken was awarded 1st with a large, but not highly coloured *Croton Queen Victoria*; 2nd, Mr. Lockie, with a fine *Kentia Fosteriana*.

For six stove and greenhouse Ferns, 1st, Mr. Aitken, with a good even lot, including a very fine *Gymnogramma peruvianum argophyllum* and *Goniophlebium subauriculatum*.

Some good *Fuchsias* were staged in the class for six by Mr. Hopkins, gr. to J. W. Burrows, Esq., The Elms, Cookham, the plants being pyramidal in shape and 6 feet high, but wanting a few more days to open; 2nd, Mr. Manley.

For six tuberous-rooted *Begonias*, 1st, Mr. Goodman, gr. to C. Hammersley, Esq., Abney House, Bourne End, with large and well-grown plants of old varieties.

Very fine *Cockscombs* were shown by several exhibi-

bitors, Mr. Lockie coming 1st, Mr. C. Maskell, gr. to S. Young, Esq., Maidenhead, 2nd.

Mr. Aitken staged six grandly flowered large zonal Pelargoniums, noticeable being Queen of the Whites, Lelia, and F. von Haspail.

The competition was extremely keen for six Coleus, although all were more or less deficient in colour. Mr. D. Paxton gr. to the Hon. C. S. Irby, Hitcham Grange, Taplow, was 1st, with nice pyramidal plants; and Mr. Hopkins 2nd.

Groups of plants arranged for effect formed one of the leading features of the show, more especially those of the largest size which were required to fill a space of 12 feet by 10 feet on low staging. Here Mr. Aitken had arranged a beautiful group of plants in his best style, all the plants being fresh and in fine condition. In the centre, the pot slightly elevated, was a nice Cocos Weddelliana; the groundwork consisted of Maidenhair Ferns and Gloxinias, and covered the central pot, thus forming a mound. Out of the groundwork rose nicely arranged highly coloured Crotons and Dracenas, Tuberoses, Francoa ramosa, Gladioli, Hyacinthus candicans, Eulalias, &c., the whole forming an admired group—one of the best we have yet seen, and was deservedly awarded 1st position.

For twelve Roses, Mr. J. Walker, nurseryman, Thame, was 1st with very fine blooms, especially those of Her Majesty, Marie Verdier, Merveille de Lyon, and Marie Bauman; 2nd, Mr. Hughes.

Mr. Walker also staged the best twelve Dahlias. Asters in variety, double and single, Zinnias, &c., were shown in quantity, the principal prizewinners being Messrs. Walker, Hughes, and Hiatt.

**Fruit.**—This was shown in considerable quantity, but white grapes were generally unripe. In the leading class for six dishes, Mr. Aitken was 1st with good Black Hamburg and unripe Muscat Grapes, Queen Pine, a small fruit of Hero of Lockinge Melon, Pine-apple Nectarine, and poor Royal George Peaches; Mr. Goodman was a close 2nd, staging fair black and white Grapes, and fine dishes of Kirke's Plum, Bellegrape Peaches, Lord Napier Nectarines, and a fine Victory of Bristol Melon.

For four dishes Mr. Paxton was 1st, having very good Foster's Seedling Grapes.

Mr. Aitken had the best four dishes of fruit grown in the open air, followed by Messrs. Goodman and Hughes.

Some very fine black Grapes were shown. For three bunches of Black Hamburg, Mr. T. Osman, gr. to L. J. Baker, Esq., Otterbury Park, Chertsey, was a good 1st, with large bunches and well coloured berries; 2nd, Mr. Hopkins; and for any other black variety, Mr. Osman was again 1st, Mr. Waite 2nd—both exhibitors showing Alicante.

White Muscats were poor in quality, while for any other variety some excellent Foster's Seedling were staged by Messrs. Paxton and Osman, Mr. Hughes being 3rd in a very good class.

Mr. Goodman was well 1st both for six Peaches and the same number of Nectarines. Mr. Aitken had the best pair of Melons. Several dishes of good Lord Suffield Apples were staged in the culinary classes, all the prizes going to that variety.

**Vegetables** were staged in abundance, and in most instances of good quality, the finest produce competing for the special prizes offered by Messrs. Sutton & Sons for six varieties, and which brought in competitors. Mr. Waite was 1st, having very fine Sutton's Perfection Tomato, New Intermediate Carrots, and Satisfaction Potato.

Mr. Lockie was a good 2nd; in his lot, Eclipse Cauliflower was very fine; Mr. Manley 3rd. Messrs. Waite, Lockie, and Woodford also secured the prizes offered by Messrs. Webb & Sons, with very similar produce. Many classes were devoted to simple dishes of vegetables, in which the competition was keen, Potatoes being especially good; cottagers and amateurs also showing well.

**Miscellaneous.**—Messrs. Sutton & Sons, Reading, contributed a very extensive collection of annuals and hardy herbaceous flowers. Their stocks of Phlox Drummondii, Dianthus, Seedling Carnations, Poppies in variety, white Mignonette, double and single Chrysanthemums, were all highly commended. Messrs. Vaisey & Sons sent from their grounds at Langley a choice collection of 350 Roses, admirably put up, especially fine being some blooms of La France, Senateur Vaisey, A. K. Williams, Heinrich Schultheis, Eugene Fürst, Grace Darling, Fisher Holmes, and Marquise de Castellane.

Messrs. Sutton & Sons were awarded a First-class Certificate for a new and beautiful strain of their Netted Gloxinias, quite distinct from the many varieties now in commerce; the veining is more

heavily marked and shows well at a distance. The plants exhibited were netted with white on a bright red ground. The strain exhibits various other colours.

Mr. W. Clark, Reading, exhibited specimens of his improved patent system of glazing which has met with much success.

## TAUNTON HORTICULTURAL.

**Arrears 16.**—This exhibition took place as usual in Vivary Park, and the day being fine and cool, a very large attendance resulted. The show was as extensive as ever, and of the usual high order of merit, except in fruit, and such cut flowers as Dahlias, Hollyhocks, Gladioli, &c., which showed the effects of the late season.

**Stove and Greenhouse Plants.**—The best twelve specimens, to which the handsome prize of £20 was awarded, came from Mr. James Cypher, nurseryman, Cheltenham, who had Ericas Thompsoni, ampullacea, Marockiana, and Irbiana; Bougainvillea florata, Pistia profusa, Clerodendron Balfourianum, Isora Pilgrimii, &c.; a good even lot. 2nd, Mr. Lock, gr. to W. B. Cleave, Esq., Crediton, who had good specimens of Allamanda Hendersoni, A. nobilis, Eucharis amzonica, Stephanotis floribunda, Statice Holfordi, Ericas Everiana, Fairicena, and Lindleyana, &c. The best new plant in bloom was Odontoglossum Harryanum, from Mr. J. Cypher; Mr. H. Godling, nurseryman Camble, Taunton, being 2nd, with Plumbago capensis alba. The best new foliaged plant was Aloecia Van Houttei, from Mr. W. C. Drummond, nurseryman, Bath; Mr. Cypher being 2nd, with Neprolepis refricans tripinnatifolia. The best collection of twelve stove and greenhouse plants in the amateur's division came also from Mr. Lock, who had Lantana borbonica, Aloecia Thibautiana, Clerodendron Balfourianum, Croton angustifolius, Eucharis amzonica, &c. Mr. E. Wills had the best four plants in bloom, having good specimens of Clerodendron Balfourianum, Erica oblonga purpurea, Allamanda nobilis, and Lapageria rosea; 2nd, Mr. Lucas. The best specimen stove plant was a fine piece of Nepenthes Mastersi, with eighteen pitchers, from Mr. Lucas; he also had the best greenhouse plant in flower, staging Statice brassicifolia. The best specimen Fern was Gleichenia selanica. Fuchsias, bedding and variegated Pelargoniums were also shown as single specimens.

**Begonias.**—The tuberous-rooted section was represented by some very fine specimens from Mr. H. Godling.

**Miscellaneous Flowering Plants.**—These included Pelargoniums of the bedding section, but grown in very large pots; Fuchsias, the best coming from Mr. C. Drummond; Cockscocks, the best coming from Mr. H. T. Manley; Lilies; Achimenes, Mr. C. Lucas being 1st, with four very fine specimens, grandly grown and flowered, the varieties being Dazzle, Mauve Queen, Perfection, and Margaretta; 2nd, Mr. A. Tucker, gr. to Major Winter. Gloxinias were shown in fours, and Petunias were well grown and flowered specimens.

**Orchids.**—Mr. Cypher was the only exhibitor of four Orchids, staging nice specimens of Cattleya crispa superba, C. Gaskelliana, Saccobolium Blumei, and Cypripedium Stonei.

**Groups of Plants arranged for Effect.**—This was a new feature, and proved highly successful. In the class to cover a space of 100 feet, Mr. C. Lucas put up a very pleasing arrangement. In the amateur's division, to fill a space of 50 feet, Mr. Wills was 1st, and Mr. Lucas 2nd.

**Cut Flowers.**—Roses were well shown in the open class by S. P. Budd, Esq., Bath (Mr. Campbell, gr.); and Messrs. G. Cooling & Sons, Bath. The former had the best twenty-eight varieties and also twenty-four varieties, three blooms of each. In the amateurs' class for twenty-four blooms, and also that for twelve, Mr. Budd was 1st, with good flowers. Tea Roses were also well shown by the same exhibitors. Dahlias were below the average, and single Dahlias being shown as single blooms made, as might be expected, a poor display. Hollyhocks, Asters, Verbenas, Carnations and Picotees fell below their usual average, owing to the season, but zonal Pelargoniums were remarkably good.

**Table Decorations, &c.**—The tent in which these were placed is always a special object of interest at Taunton. Handsome prizes were offered for the best dinner-table, arranged for ten persons, arranged with fruit and flowers. Mr. Lock was 1st, with three vases of uniform size and arrangement. Mr. Hoskins was a good 2nd, but the arrangement fell short of Mr. Lock's work. Two tables were arranged accord-

ing to what is said to be the prevailing fashion, viz., with a groundwork of some soft gauzy material of a golden or buff colour laid in the form of an elongated oval in the centre of the table in folds: one had a groundwork of this of a bright golden colour, with vases of scarlet Poppies; another had buff instead of gold, with leaves of the purple Beech laid upon it, and some simple low vases of flowers. This was shown by Miss Grace Tarrant, and awarded the 3rd prize in the competition.

**Fruit.**—The best collection of ten varieties came from Mr. H. W. Ward, The Gardens, Longford Castle, Salisbury, who had Madresfield Court and Buckland Sweetwater Grapes, Exquisite Peaches, Negro Largo Figs, Queen Pine, Black Circassian Cherries, Melon, and Jargonelle Pears; 2nd, Mr. Igoulden. The Gardener of Alexandria, Moor Park, Apricots, Brown Ischia Figs, and an excellent Queen Pine. This collection ran Mr. Ward very close indeed. Mr. Pratt, The Gardens, Longleat, Warminster, was 3rd.

The best collection of four dishes came from Mr. Daffurn, gr. to D. Cox, Esq., who had Madresfield Court Grapes, Noblesse Peaches, Elrue Nectarines, and Melon; 2nd, Mr. Pratt, with Muscat of Alexandria Grapes, Crimson Galande Peach, Elrue Nectarine, and Melon.

Mr. Ward had the best Pine-apple, staging a good Cayenne.

Mr. Pratt was placed 1st with three bunches of Black Hamburg Grapes, showing highly-finished examples, Mr. Igoulden being 2nd. The best black Grapes other than Hamburg was Madresfield Court, from Mr. Daffurn, Mr. Ward being 2nd with well-finished Gros Marquis. Mr. Ward had the best three bunches of white Muscats, Mr. Pratt coming 2nd. In the class for any other white, Mr. J. Webber, gr. to G. F. Luttrell, Esq., with Buckland Sweetwater somewhat green, Mr. J. Lloyd coming 2nd with well-finished Foster's Seedling.

The best dish of Peaches was Sea Eagle, from Mr. W. Igoulden, Mr. Daffurn being 2nd with Grosse Mignonne.

One or two fairly good dishes of Moor Park Apricots were staged. Mr. Daffurn had the best dish of Nectarines, staging good Elrue; Mr. Crossman being 2nd, with Pine-apple. Pears were below the average; Plums, light and coloured, were wanting in finish; Cherries were represented by fine Black Circassian. The best dessert Apples were Astrachan and Beauty of Bath; the best culinary, Lord Suffield, Cragmott and Gooseberries were generally fine.

**Vegetables.**—These were very largely shown and generally of very fine quality. The special prizes offered by Messrs. Sutton & Sons, Reading, for six dishes of vegetables brought a remarkably good competition: Mr. G. Garaway, Bath, being 1st, and Mr. H. Moore 2nd. Similarly, Messrs. Webb & Sons', Worsley, special prizes for a similar number brought a good competition also; Mr. T. Tilley being 1st; and Mr. G. Ricks, 2nd.

The best collection of ten dishes of vegetables was shown by Mr. W. Every, a very fine lot; Mr. T. Webber being 2nd.

Potatoes were especially numerous. Mr. Ward had the best six dishes, consisting of International Kidney, Worsley Kidney, Pritzetaker, Vicar of Laleham, Blanchard, and Schoolmaster; 2nd, Mr. J. H. Virgo, with Reading Russet, Vicar of Laleham, Sutton's 36, Snowdrop, Jackson's Kidney, and General Gordon. Tomatoes are very fine, the Perfection being the leading one; the cottagers' division the competition was exceedingly keen.

**Trade Collections.**—These were furnished by Messrs. Lucombe, Pince & Co., nurserymen, Exeter, who had a group of decorative plants, cut blooms of Carnations and Picotees, &c.; Messrs. R. T. Veitch & Sons, nurserymen, Exeter, who had a pleasing group of plants of great interest, including some blooms of great interest, including some of new yellow Picotees, to four of which First-class Certificates of Merit were awarded, viz., Almira, Annie Douglas, Agnes Chambers, and Dorothy; Mr. B. R. Davis, nurseryman, Yeovil, who had a large collection of Begonias, single and double—a special Certificate of Merit being awarded to the latter as a fine strain; and Messrs. Kelway & Sons, Langport, who had Gladioli, Delphiniums, Gaillardias, &c., of fine quality. First-class Certificates of Merit were awarded to Gladioli Regia, Orbit, and Faust; to Gaillardia Socrates, a very fine single variety; and splendissima plenissima (!), a fine new and distinct double variety; and to Delphinium Thomas Baines, a single pale blue variety of fine form.

## DEVON AND EXETER HORTICULTURAL.

AUGUST 18.—The 167th exhibition of this Society was held in the public grounds of Northernhay. The weather proved all that could be desired, and the display of plants, cut flowers, fruit and vegetables, in the various tents was of a high order.

*Cut Flowers (Open).*—For a collection of forty-eight Dahlias, double, distinct, Mr. J. Nation, Taunton, was 1st, but did not show so well as usual, owing probably to the lateness of the season; his best blooms were Emily Edwards, Mrs. Saunders, Vice-President, Mrs. S. Hibberd, F. Smith, Earl of Ravensworth, Peacock, Harrison Weir, Mr. J. C. Reid, W. Rawlings, James Cocker, Grand Sultan, Imperial, Mrs. F. Foreman, and Crown Prince.

Mr. Rowland, gr. to Wm. Brock, Esq., Exeter, led in the class for eighteen bunches of cut flowers, showing a good lot. Mr. Rowland also led for nine stove and greenhouse flowering plants, with a nice lot of fresh plants, including *Alamanda Hendersoni*, *A. grandiflora*, *Ixora*, *Williamsi*, *I. Duffi*, *Dipladenia amabilis*, with splendid flowers and foliage; a grand well-flowered specimen of *Stephanotis floribunda*, *Bougainvillea glabra*, *Anthurium Andreanum*, and *Rondeletia speciosa* major. Mr. Locke, gr. to W. C. Cleaver, Esq., Crediton, who had some grand specimens, but had materially suffered through being exhibited at various shows before, was 2nd. *Ericas*, *Allamandas*, *Phloxes*, *prolifera* Barnesi, *Eucharis amazonica* (a grand pot), and *Clerodendron Balfourii* were good. The same exhibitor was an easy 1st for nine stove and greenhouse foliage plants; his *Crotons* were especially good and highly coloured. *Cycas circinalis*, *Encelphalartos villosa*, *Kentia Fosteriana* and *K. Balmoreana*, *Alocasia Thibautiana* and *A. dasylyris* were amongst the best. Mr. Rowland followed with fine plants of various Palms. Mr. Locke secured another 1st for Ferns, with splendid plants of *Adiantum cuneatum*, *Idesia hijsiensis*, *Tyermanni*, *bullata*, and *polyantha*. *Nephrolepis davallioides* furcans, *Cibotium* pinex.

For a group of miscellaneous plants arranged for effect on 100 square feet, a Silver Cup was given by the Mayor of Exeter (C. T. K. Roberts, Esq.). Here Mr. Locke was again successful, eclipsing anything he has ever put up at this show in previous years; Mr. Rowland again followed him with a very effective arrangement.

Six *Fuchsias*, distinct, were good, from Mr. Mollon, gr. to Mrs. Ponget; and Mr. Staddon, gr. to Col. Courtenay, led for *Gloxinias*, showing very well.

*Fruit.*—Collections of ten dishes were good. Mr. Igoulden, gr. to the Earl of Cork, Marston House, Frome, had the 1st prize lot, with fine bunches of Black Hamburg and Muscat of Alexandria Grapes, large and handsome Sea Eagle Peaches, Lord Napier Nectarines, Moor Park Apricots, Brown Schi Figs, Florence Cherries, Plum Early Bride, and Hero of Lockinge Melon. Mr. James, gr. to Sir J. Walrod, Bart., who had fine and well finished bunches of Black Hamburg Grapes, Melon High Cross Hybrid, splendid Elvage Nectarines and Bellegrape Peaches, Napoleon Bigarreau Cherries, and Dumelow's Superb Plum, led in the smaller class for six dishes. Single dishes of Grapes were numerous, Messrs. Igoulden, Pike, Barnes, and Langworthy taking the chief prizes.

*Vegetables* were shown in grand style—never better. For the collection of twelve kinds Mr. Harris, gr. to Sir G. Shelley, put up a splendid lot, including Red-top Turnip, Sutton's Gem Celery, Intermediate Carrot (James), Hulin's Giant Cauliflower, Moore's Cream Marrow, Reading Perfection Tomato, Sutton's Reading Sprouts, Purly Park Hero Cucumber, Sutton's Seedling Potato, Duke of Albany Pea, Girtford Giant Runner Bean, and Giant Rocca Onion; Mr. Leach, gr. to J. Drew, Esq., was a very good 2nd. The prizes offered for a single dish of vegetables were all well contested. D. C. P.

## SHERBORNSHIRE FLORAL AND HORTICULTURAL.

AUGUST 22 AND 23.—Several tents were occupied in displaying the numerous exhibits (numbering 2800 entries), being some 360 more than last year, and which were generally of a high order.

*Plants.*—In the principal class—that for twenty stove and greenhouse plants, prizes of £25, £20, and £15 being offered—there were three competitors, their combined efforts making a very meritorious display. In this class Mr. James Cypher, Cheltenham, staged some grand examples of cultivation, and

took the 1st place, the most noteworthy being *Erica Irbayana*, *E. ampullacea* Barnesi, *Statice profusa*, *Ixora Fraseri*, *Bougainvillea glabra*, *Allamanda nobilis*, *Croton Queen Victoria*, grandly coloured; *Latania borbonica*, *Cycas revoluta*, &c. Mr. C. Roberts, gr. to A. Nicholson, Esq., Highfield Hall, Staffs., made a close 2nd, with very fine examples of *Dipladenia profusa*, *Erica retorta* major, *E. jasminiflora*, and *Crotons*.

For nine stove and greenhouse plants, Messrs. Fritchard & Sons, Shrewsbury, who also had good *Fuchsias* and zonal *Palargoniums*, led, the most noteworthy plants being *Clerodendron Balfourii*, *Allamanda Hendersoni*, *Gleichenia dichotoma*, *Davallia Mooreana*, &c.; 2nd, Mr. J. Farrant, gr. to Mrs. Jason, Abbey Forge, with, amongst others, good examples of *Franciscea calycina* major, *Dipladenia amabilis*, *Erica æmula*, and *Ixora amabilis*.

In the class for six stove and greenhouse plants, confined to gentlemen's gardeners in Salop and Montgomery, Mr. J. Farrant was again to the front.

With six exotic Ferns, Mr. C. Roberts was to the fore, his principal plants being *Todea superba*, a fine piece; *Cyathea medullaris*, *Platynerium alciome*, and *Dicksonia antarctica*.

Mr. J. Cypher was again victorious with six plants in flower, *Orchids* excluded, *Erica ferruginea superba* being shown finely flowered; 2nd, Mr. C. Roberts, who led in the class for six Palms, with large examples of *Latania borbonica*, *Thrinax elegans*, *Kentia australis*, &c.

*Cut Flowers.*—In the classes for thirty-six and twenty-four Dahlias, the 1st and 2nd prizes were taken by Messrs. Heath & Sons and Mr. W. Shaw, the last-named exhibitor securing 1st honours for eighteen *Gladioli* spikes. Roses were best from Messrs. Perkins & Sons, Coventry; and from Mr. S. Garner. Bridal and hand bouquets and buttonholes were well shown by Messrs. Perkins & Sons.

*Fruit.*—For the collection of twelve dishes, four competitors appeared, the 1st place being accorded to Mr. R. Dawes, gr. to Hon. Mrs. Ingram, with very noticeable specimens of Royal George Peaches, Barbarossa Grapes, Brown Turkey Figs, Queen Pine, and Roman Apricots; 2nd, Mr. J. H. Goodacre, gr. to the Earl of Harrington, who had fine Barrington Peaches, Elvage Nectarines, and Muscat of Alexandria Grapes, &c. Mr. Pratt, gr. to the Marquis of Bath, Longleat, and Mr. Gilman, gr. to the Marquis of Shrewsbury, Ingestrir, being respective 3rd and 4th. Mr. J. Lambert, having good Royal George Peaches, Humboldt Nectarines, Gooseberry Wonderful (very fine), Black Hamburg and Muscat of Alexandria Grapes, led in the collection of nine dishes.

In the class for six Peaches as many as eleven competitors appeared, Mr. Gilman leading with grandly-coloured Barrington. Out of ten entries for Nectarines, Mr. Burnett, gr. to Hon. C. H. Wynne, was 1st, with Pine-apple.

Black and white Grapes were shown in wonderfully good condition, considering the nature of the season, by Mr. J. Stevenson, gr. to Col. Pilkington, Prescott, Mr. Pratt, Mr. Davies, Mr. Bennett, Mr. Barker, Mr. Middleton, and others.

*Vegetables.*—The centre of attraction in this department of the exhibition, which was well represented, Potatoes being largely shown, was the class for a collection of vegetables, twelve varieties in competition for the prizes offered by the Veitch Memorial Trustees. There were thirteen entries, Mr. J. Lambert, gr. to Onslow Hall, with a magnificent lot, being adjudged the premier place, his principal dishes being Autumn Giant Cauliflower, Lyon Leek, Snowball Turnip, Parley Park Cucumber, Laxton's Car Runner Beans, Prodigy Pea, Prime Minister Potato, Carrot Improved Intermediate, &c.; 2nd, Mr. C. J. Waite, Glenhurst Gardens, Esher, who has good specimens of Sensation Tomatoes, White Tripoli Onions, Ne Plus Ultra Bean, New Intermediate Carrot, Autumn Giant Cauliflower, &c.

*Special Prizes.*—For the prizes offered by Messrs. Webb & Sons for a collection of vegetables, eight distinct kinds, Mr. C. J. Waite took 1st prize with fine Chancellor Turnip, Sensation Tomato, Major Clark's Celery, Duke of Albany Peas, White Tripoli Onions, New Intermediate Carrot, &c.; Mr. J. Lambert and Mr. A. J. Skinner following in the order named.

Prizes were offered by Messrs. Sutton & Sons for Cucumbers, Mr. A. J. Skinner and Mr. G. Pearson, gr. to Lord Berwick, being respectively 1st and 2nd. For prizes offered by the same firm for Melons, 1st, Mr. C. J. Waite; 2nd, Mr. W. Palmer; 3rd, Mr. Borlase, each staging Hero of Lockinge.

*Miscellaneous.*—Messrs. R. Smith & Co., Worcester, contributed a good collection of foliage and flowering plants; Messrs. W. & J. Birkenhead, Sale, staged a very interesting and beautiful collection of Ferns; from Messrs. Kelway & Sons, Langport, there was an attractive bank of *Gladioli*, *Delphiniums*, *Gaillardias*, &c.; and Messrs. H. Cannell & Sons, Swanley, Kent, had *Dahlias* and zonal *Palargoniums* (cuttrusses); Messrs. Jones & Son, Shrewsbury, sent foliage and flowering plants, prays, bouquets, &c.; Messrs. Clibran & Son, foliage plants; Messrs. Dobie & Co., Rothesay, cut foliage and table plants; 238 Ferns, *Ericas*, *Liliums*, *Fuchsias*, *Palargoniums*, and *Begonias*; 88 epergnes, baskets of flowers, and dessert tables; 69 hand and bridal bouquets, sprays, and buttonholes; 592 Dahlias, *Hollyhocks*, and *Gladioli* (spikes) 300 Roses; 54 bunches of herbaceous flowers; 1670 Asters, Carnations, *Picotees*, *Marigolds*, and *Pansies*; 217 dishes of fruit, and 105 bunches of Grapes. These figures do not include the exhibits for which several prizes were offered, nor those which were not for competition.

## NEWCASTLE FLOWER SHOW.

AUGUST 22–24.—There were (says the *Newcastle Daily Leader*) 112 exhibitors with 3492 exhibits, and the entries comprised 15 plants in bloom, cut foliage and table plants, 238 Ferns, *Ericas*, *Liliums*, *Fuchsias*, *Palargoniums*, and *Begonias*; 88 epergnes, baskets of flowers, and dessert tables; 69 hand and bridal bouquets, sprays, and buttonholes; 592 Dahlias, *Hollyhocks*, and *Gladioli* (spikes) 300 Roses; 54 bunches of herbaceous flowers; 1670 Asters, Carnations, *Picotees*, *Marigolds*, and *Pansies*; 217 dishes of fruit, and 105 bunches of Grapes. These figures do not include the exhibits for which several prizes were offered, nor those which were not for competition.

The large marquee was divided into three sections, and up the centre ran the table upon which, perhaps, the most delicate and pretty collection of the whole show was displayed—namely, hand and bridal bouquets, sprays, buttonholes, epergnes, baskets of flowers, and dessert tables.

Grapes were about the largest section, the white kinds predominated in numbers, but the splendid large bunches of Black Hamburgs, with bloom almost untouched, had a richer appearance. Nectarines, Peaches, Pine-apples, Pears, and other fruit were arranged in profusion, and were well set off with dishes of Currants, Cherries, &c.

Cut flowers, of course, formed a very important item in the show; Roses, Carnations, *Picotees*, Asters, *Marigolds*, Dahlias, *Gladioli*, *Hollyhocks*, and other kinds, all in great variety, formed a showy and handsome display. The Roses, Carnations, and *Hollyhocks* were exceptionally fine. Stove plants in bloom were well exhibited.

A special prize for the best collection of six varieties of vegetables was given by Messrs. S. Finney & Co., seed merchants, Newcastle. This being the largest of the special prizes brought a good competition. There were, as usual, three divisions—open, amateur, and special—and whichever one was examined it was seen that the competition was very close, and the judges—Mr. James Douglas (Essex), Mr. John Paterson (Edinburgh), Mr. John Ward (Essex), Mr. Jas. Grieve (Edinburgh), Mr. J. Machonochie (Alexandria, N.B.), and Mr. Joshua Atkins (Cheshire)—had an arduous task before them in selecting the winners. The principal prize-takers in the various classes were:—J. McIndoe, gr. to Sir Jos. Pease; J. Hunter, gr. to the Earl of Durham; Jos. Puntton, gr. to Dr. Hodgkin, Newcastle; J. Spoor, Gateshead; J. Walker and N. Walker, Low Fell; F. Edmondson and Miss Mary Edmondson, Newcastle; T. Battenby, Whickham; J. Battenby, Blaydon; J. Westcott, gr. to the Duke of Cleveland; J. McIntyre, gr. to Mrs. G. Pease, Darlington; and M. Flowdy, Gateshead.

At the east and west ends of the marquee were the stands of exhibits not for competition. In this class the judges awarded the highest honour of "very Highly Commended" to Messrs. Little & Ballantyne, nurserymen, Carlisle, who exhibited a magnificent group of foliage and ornamental plants.

Varieties of *Crotons* particularly worthy of mention were C. Prince of Wales, C. Warreni, C. Williamsi, C. Queen Victoria, and C. Countess. Taken as a whole the collection had a beautiful blend of colour, and this fact, together with the rarity and fineness of many of the plants, undoubtedly made the collection one of the most striking features in the show. Messrs. William Fell & Co., nurserymen, Hexham, deservedly received a special commendation from the judges for their collection of herbaceous plants and cut flowers. The Coniferæ—which formed the principal part of the collection—were seldom seen in such good form.

The chief varieties of Conifers were *Retinospora plumosa aurea*, *Cupressus Lawsoniana lutea*, *Taxus aurea*. Variegated grass, *Dactylis glomerata elegantissima aurea*, backed with a hardy *Fuchsia*, was used as a border to the group. Their cut flowers and Roses made a very effective display.

For a collection of herbaceous plants, flowers, &c., Messrs. Kent & Brydon, Darlington, were highly commended, and Mr. W. R. Armstrong, of High Cross, Elswick Road, Newcastle, was commended for his exhibit of six or eight large plants. Messrs. Harkness & Sons, Bedale, Yorkshire, took a prize for twenty-four cut Roses.

## THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## THE PAST WEEK.

The following summary record of the weather for the week ending Aug. 20, is furnished from the Meteorological Office:—

"The weather has been fairer than of late in Ireland and Scotland, but in most parts of England

the sky has been more cloudy than it was last week. Very little rain fell during the greater part of the period, but on the 19th and 20th a considerable amount fell over the more southern and western districts.

"The temperature has again been very low for the time of year, especially over England, where the deficit ranged from 6° to 8°. The highest of the maxima, which were recorded on rather irregular dates, varied from 65° in 'Scotland, W.' to 74° in 'Ireland, S.' On some occasions the daily maxima were extremely low; at Oxford on the 16th the thermometer did not rise above 55°. The absolute minima, which were generally recorded either on the 18th or 19th, were as low as from 32° to 37° in Scotland, and between 35° and 37° in Ireland, while over England they ranged from 34° in 'England, N.W.' and 'England, S.W.' to 41° in 'England, S.' In the 'Channel Islands' the lowest reading was 49°. Frost occurred on the grass at most of the inland stations; at Hillington on the 19th the thermometer exposed on the grass fell to 26° 6.

"The rainfall has been more than the mean in 'England, S.W.' 'Ireland, S.' and the 'Channel Islands,' but in all other districts a deficit is shown.

"Bright sunshine has been more prevalent than it was last week over Ireland, Scotland, and the West of England, but less so over central, southern, and eastern England. The percentage of the possible amount of duration ranged from 25 in 'England, E.' to 43 in 'England, S.W.' 44 in 'Scotland, W.' and 53 in 'Scotland, N.'"

## ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

GENTIANA ASCLEPIADEA.—Can this plant be propagated by cuttings, and if so, what is the proper time for striking? If not by cuttings, how otherwise can it be increased? C. E. F.

## NOTICES TO CORRESPONDENTS.

ADIANTUM FARLEYENSE: G. Very fine pinnae, but no trace of spores.

APPLE CROF: Woodall & Co. Particulars as to the condition of the crop are to be found in our report of the fruit crop, published on July 28 last.

BOOK ON JUDGING AT FLOWER SHOWS: G. H. We do not know of any work quite so comprehensive as that which you require, although there are some on the methods of judging certain florists' flowers.

BLUE HYDRANGEAS: S. For. We are specially glad to hear from a forty years' subscriber to our journal. Hydrangea hortensis flowers may be made blue by using some kinds of artificial manures; they also change to a shade of that colour in peaty soils containing iron; and they may likewise be made to put on a blue colour by being watered during the blooming period with a weak solution of common alum.

CARNATION R. H. ELLIOT: This variety, certificated on the 14th inst. at the Royal Horticultural Society's meeting, was exhibited by Messrs. Laing & Mather, of Kelso, N.B.

CARNATIONS: J. Wilks. A very pretty lot, of good bright colours. No. 36 is specially good and rich.

CENTAUREA AUREA, Ait. (= Crocodylium aureum, Sweet): C. W. Dod. Figure in Botanical Magazine, 421, is a good species, but, I believe, is not now in cultivation. There is only a single specimen in the herbarium at Kew, labelled "C. aurea, Ait., Port Juvenal," and I find no trace of it anywhere else. D. D.

DOUBLE WHITE LAPAGERIA: J. D. G. We have never seen this before; the stamens are replaced by petals, and the carpels also partially, and increased in number.

GROWTH ON AZALEAS, &c.: J. L. The gall-like production is caused by a fungus called *Exobasidium vaccinii*, common on members of the *Erica* or *Heath* family.

IVY: J. F. No harm will arise by cutting it back, but do so at once, and the slight growth which will take place before winter will cover its otherwise ugly skeleton.

NAMES OF PLANTS: A. L. Lange. *Lilium auratum*.—E. K. G. *Astrantia major*.—Frank. *Ononis arvensis*.—Alpine. 1, *Lastrea glabellum*; 2, *Verbasum nigrum*; 3, *Viburnum Lantana*; 4, *Crucianella stylosa*; 5, *Zenobia pulverulenta*; 6, *Phyllaea angustifolia*; 7, *Prunus Lauro-cerasus*, narrow leaved variety; 8, not recognised.—*Enquir.* *Chrysanthemum coronarium* fl.-pl., yellow variety.—C. E. F. *Cryptopteris alba*, please say if cultivated or wild.—J. C. *Shadwell*. *Celtis occidentalis*.—H. L. 1, not found enclosed; 2, *Calamintha clinopodium*; 3, *Carum segetum*; 4, *Silene Schafta*; 5, *Calamintha acinos*; 6, *Asperula cynanchica*; 7, *Aster*, not trifolium, if growing near the sea.—L. J. *Catananche cerulea*.—Mrs. E. Sparganium ramosum, *Mentha hirsuta*.—T. C. H. *Masdevallia erythrochate*. The pretty *M. Hinksiana* × between *M. tovarensis* and *M. ignea* appears to be one of the most beautiful of garden hybrids. Its bright yellow flowers are unmatched among *Masdevallias*.

PEAS: H. R. L. Your Peas are too small.—*Workop*. We are unable to name Peas unless we see them growing; there are so many varieties, and all very similar.

PINE-APPLES ON SUCKERS: T. T. B. Not at all remarkable, it being the natural mode of fruiting. The removal of suckers, and then fruiting them, is of course an artificial method. Those growers who plant out their Pine-apple fruiters will often allow two or three suckers to bear fruits without removal from the parent stock; but the necessary mounding up of the suckers, so as to afford them nourishment by means of their own roots, is often an unsatisfactory and awkward operation.

SPECIES OF ERICA: Jed. We cannot say, for certain, how many are grown in this country now, but it is certainly fewer than fifty years ago. Hardy *Ericas* number about fifty species and varieties, and greenhouse species and their varieties about 130.

THANATOPHORE (MARTIN'S): E. H. C. The agent for the United Kingdom is Mr. B. S. Williams, Victoria Nurseries, Upper Holloway, London, N. Your other question next week.

VINE LEAVES: G. H. Judging from the appearances, the disfigurements are due to some temporary cause, and if the Vines are cut hard back they are likely to break well next year. There is no insect or fungus.

YELLOW MARGUERITE: W. T. U. The presence of tubular florets is not uncommon. It is only an exaggeration of the natural condition.

COMMUNICATIONS RECEIVED.—Prof. Corner, Paris—F. W. M., Glasgow—F. W. B., Dublin—W. C.—W. S. M.—C. C.—H. G.—I. L.—J. C. & Co.—A. O. W. (many thanks)—J. H. C., Geneva—G. B. (next week)—C.—J. D.—D. J. ## SEEDS.

LONDON: August 22.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report to-day's market quiet but firm. For every description of Clover seed the tendency of values is still in an upward direction. In Alsike and white the recent advance is well maintained, and the turn for red Clover seed now appears to have come. The crops in Ireland of both perennial and Italian Ryegrass are said to be good. New English Trifolium offers at moderate quotations. Blue Peas are rather dearer. There is no change in either Mustard or Rape seed. New winter Tares are slightly easier. Seed Rye keeps steady. For bird seed the trade is slow.

## FRUIT AND VEGETABLES.

SPITALFIELDS: August 22.—Good supplies of all kinds of fruits and vegetables, with a fair demand. Shorter supply of Potatoes; trade somewhat better. Quotations:—Fruit: Gooseberries, 3s. to 3s. 3d. per half sieve; English Green Grapes, 5s. 6d. to 7s. per bushel; foreign do., 4s. to 5s. per half-flat; do. 2s. 6d. to 3s. per bushel of about 18 to 20 lb.; Cherries, 2s. to 4s. per half sieve; black Currants, 3s. 6d. to 4s. 6d. do.; red do., 2s. 6d. to 3s. 6d. do.; Apples, 4s. 6d. to 7s. per bushel; do., 2s. 6d. to 3s. 6d. per half-bushel; Pears, 4s. 6d. to 6s. per bushel; English Tomatoes, 4s. 6d. to 5s. 6d. per peck; English Plums, 4s. to 5s. 6d. per half-sieve; foreign do., 2s. to 2s. 6d. do.; do., 3s. to 5s. 6d. per flat. Vegetables: Cauliflowers, 2s. 6d. to 4s. per tally; Cabbages, 1s. 6d. to 3s. do.; Vegetable Marrows, 2s. 6d. to 4s. do.; Peas, choice, 2s. 6d. per bushel; do., 3s. 6d. to 5s. 6d. per sack; Broad Beans, 1s. to 1s. 6d. per bushel; do., 1s. 6d. to 2s. per sack; Scarlet Runners, 1s. 9d. to 2s. 6d. per sieve; Onions, 2s. 3d. to 3s. 6d. per dozen bunches; Turnips, 2s. to 2s. 3d. do.; Carrots, 1s. 9d. to 2s. do.; Beetroot, 2s. 6d. to 3s. do.; Mint, 1s. to 2s. do.; Parsley, 1s. to 1s. 6d. do.; Foreign Onions, 5s. 6d. to 7s. per case; frame Cucumbers, 3s. to 5s. 6d. per dozen; common do., 9d. to 1s. do.; Endive, 1s. to 1s. 3d. do.; Cos Lettuce, 6d. to 8d. per score; Walnuts (for pickling), English, 2s. to 2s. 3d. per half sieve.

## POTATOS.

SPITALFIELDS: August 22.—Quotations:—English Regents, 70s. to 80s.; do. kidneys, 70s. to 80s.; Beauty of Hebron, 60s. to 70s.; Early Rose, 50s. to 55s. per ton.

## DUCH FLOWER ROOTS.

JAMES VEITCH & SONS  
BULB CATALOGUE FOR 1888

# THOMAS GREEN & SON, LIMITED,

SMITHFIELD IRONWORKS, LEEDS, AND SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

**HOT-WATER BOILERS,**

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.

**SADDLE BOILERS**, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the nearest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE, a SILVER MEDAL, at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

**The Best Boiler Extant.**

— FRONT ELEVATION —

— LONGITUDINAL SECTION —

SECTIONAL PLAN.

The longitudinal section gives a view of the fire-box, water space, flues, &c.

The cross section gives a view of the fire-box, water space and V-shaped baffle. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

Calculated to heat 4-in. piping as follows:—

**TESTIMONIALS.****Re HEATING APPARATUS.**

Messrs. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather. Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.

it has been power to work a much greater length, while in cost of fuel it compares favourably with any other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

Yours faithfully,

(Signed)

G. W. BASHFORD.

SPHINCTER GRIP  
GARDEN HOSE.

The Sphincter Grip Spring Steel Galvanised Armoured Ho e  
is the most valuable improvement in Hose since 1840. Its last-  
ing qualities are ten times greater than any Hose not armoured.

Its complete success has caused some parties to infringe the  
Patents owned and controlled solely by us; and we therefore  
notify all such that the making, vending, or use of any armoured  
wire-wound Hose not of our manufacture is an infringement of  
one or more of our several Patents, any violation of which will  
be promptly prosecuted. Brass plates set between the Hose  
and wire denote our Manufacture and the Patents.

For Price Lists and particulars of  
The Original and Only Genuine Sphincter Grip  
Armoured Hose,  
APPLY TO THE:

S.G.A. HOSE CO. (Ltd.),

**JOURNEYMAN, in the Houses, in large establishment.** Good experience and also good references. Both preferred.—H. B., 25, Anerley Vale, Upper Norwood, S.E.

**JOURNEYMAN, in the Houses, under a Foreman.**—Age 19; eighteen months' experience in present situation. Good references.—A. BELCHER, Leonardards Garden, Lower Beeding, Horsham, Sussex.

**JOURNEYMAN;** age 20.—F. HOWLAND, Gardener at Marsden House, South Shields, can highly recommend a young man as above. Two years' good character.—A. SADLER, Marsden House, South Shields.

**JOURNEYMAN, or SECOND.**—Age 23; two years in the Houses here. Abstinence.—T. BARSON, Fairford Park Gardens, Fairford, Gloucestershire.

**IMPROVER, under Glass.**—Age 19; three years' good references. Total abstinence.—W. GRIFFITHS, Nursery, Whittington, Oswestry.

**ASSISTANT.**—Age 22; six years' experience. Well up in Seed, Plants, and Nursery Stock.—J. H. The Birches, Wordsley, Stourbridge.

**TO GARDENERS, &c.—Wanted, situation for smart youth (Gardener's son).** Has been three years under good Foreman. Strong, willing, and active. Age 18.—H. D. GARDNER, Summerhill, Kingswindsor, near Dudley.

**COWMAN, on Gentleman's estate.**—Age 26, with good character.—G. GODDARD, Woodham Hall, near Woking.

**To Nurserymen and Others.**  
**HANDY MAN, in a good Nursery or Gentleman's establishment.**—No objection to act as Carman. Good reference.—W. CRAWLEY, 7, Burrell Cottages, Beckenham, Kent.

**MANAGER and BOOK-KEEPER, or HEAD SHOPMAN.**—Age 30, married; fifteen years' experience in leading Provincial Houses. Thorough knowledge of Seed and Bulb Trade. First-class references.—GARDENERS' Chronicle Office, 41, Wellington Street, Strand, W.C.

**TO SEEDSMEN and OTHERS.**—A respectable young man requires a situation in the above. Eight years' experience in first-class House.—M. H., Lower Farm, Kensal Green, W.

**PACKER (HEAD).**—Well up in Plant, Tree, and Seed Packing; several years in Messrs. Veitch & Sons, Chelsea. Also Timekeeper, if required. Good references.—J. H., Burghfield Common, near Reading, Berks.

**CARPENTER, on an Estate.**—Age 30; used to both Good and Rough Work. Willing to be useful. Twelve years' good character.—G. E., 2, St. Anne's Cottages, Southville, Feltham, Middlesex.

**HOLLOWAY'S PILLS.**—Teachings of Experience.—The united testimony of thousands, extending over more than 50 years, most strongly recommends these Pills as the best Purifiers, the mildest Aperients, and the surest Restoratives. They never prove delusive, or give merely temporary relief, but attack all Ailments of the Stomach, Hiccups, Heart, Head, and Bowels in the only safe and legitimate way, by depurating the Blood, and so eradicating those impurities which are the source and constituent of almost every disease. Their medical efficacy is wonderful in renovating debilitated constitutions. Their action embraces all that is desirable in a household medicine. They expel every noxious and effete matter; and thus the strength is nurtured and the energies stimulated.

## THE NEW SALINE

Protected by Her Majesty's  
Royal Letters  
Patent.

## SALT REGAL,

Over Fifty Patents,  
Registrations, and  
Trade Marks.

HEALTH GIVING !!

Quite distinct from all other Salts and Saline Preparations.

HEALTH PRESERVING !!

Possesses valuable Hygienic properties hitherto unknown to Science.

**Salt Regal** corrects all impurities in the system, whether arising from breathing heated or tainted air, or through partaking of improperly-cooked food, or errors of diet—eating or drinking, acting as an instant purifier, each dose liberating a supply of a powerful antiseptic, cleansing the mouth, throat, and stomach at the same operation. **Salt Regal** is a natural disinfectant. It removes all bad humours from the body, and renders it proof against infection of every kind—Typhoid, Malaria, Cholera, and Epidemics of the most virulent type. Its timely use has saved many heavy doctors' bills. Its regular use is a certain guarantee of health.

One draught per week to the healthy will keep them in health, and a daily draught to the debilitated will restore and maintain their health. Invaluable for use in families.

Children are fond of it.

*All who take SALT REGAL regularly are good feeders, good workers, and good sleepers, and thoroughly enjoy their lives.*

Thousands of Testimonials have been received from all parts of the World.

**SALT REGAL** is sold in Bottles (hermetically sealed), 2s. 6d., and can be obtained through any Chemist as all the London and Provincial Wholesale Houses regularly stock it. Do not be persuaded to take a substitute. Remember **SALT REGAL** is a Royal Patent, and any attempt at imitation is a Felony. You cannot be deceived if you observe that the White Powder turns Rose-coloured in water, no other Saline having this property. If any difficulty in obtaining it, the Proprietors will forward direct on receipt of Postal Order.

Patentees and Sole  
Proprietors

**FRITZ & CO., SALT REGAL WORKS, LIVERPOOL.**

*SALT REGAL has made hosts of friends in the Colonies and Foreign Countries, and its increasing Sale and growing popularity are bye-words among those who sell it. No Traveller should be without Salt Regal.*

instructed by Mr. John Maller to SELL BY AUCTION, on the  
Premises, The Brimsdown Nursery, Enfield Highway, N.,  
on THURSDAY, September 20, at 12 o'clock precisely, in con-  
sequence of the unusually large number of lots, without  
Reserve, upwards of 1200 lots of remarkably well-grown **STOVE**  
and **GREENHOUSE PLANTS**, mostly in 48-pots, and fit for  
immediate Sale, consisting of:

15,000 winter-flowering  
Heaths, including  
hymalis, gracilis,  
Cafra, Wilmorea,  
&c., and extra large  
E. Cavenishii  
5,000 Solanums, exception-  
ally well grown  
5,000 Ferns, including  
Adiantums,  
Pteris, &c.

leas, &c.  
Large Azaleas for cut-  
ting

Many thousands of small **ERICAS, GENISTAS, FERNS, &c.**; large  
quantities of **ACACIAS, GARDENIAS, EUPHORIA JACQUINIFLORA**,  
**CHRYSANTHEMUMS, POINSETTIAS, EUCOMYX OVATUS aureus**, in  
stores, &c., suitable for the Trade, and other extensive buyers.

May be seen any day prior to the Sale. Catalogues may  
be had of the Proprietor, or at the Bricklayers' Shop, near the  
Nursery, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.,  
and Leytonstone, E.

N.B.—The Auctioneers desire to call the attention of intend-  
ing purchasers to this **GRANT ANNUAL TRADE SALE**,  
which has hitherto taken place at the Brimsdown Nursery,  
Tottenham; but in consequence of the Lease of that Nursery  
having nearly expired, the Sale this year, and in future, will  
take place as above, adjoining the Brimsdown Station, G.E.R.  
The whole of the Stock is in first-rate condition, the **ERICAS**  
being especially well sorted, and the **Solanums** and **Primulas**  
well-berried. There will also be this season a Sale at **THE**  
**BRUNSWICK NURSERY, Tottenham**, on THURSDAY, Sep-  
tember 27, of which a separate Advertisement will appear.

**Lee, Kent, S.E.**

**GREAT ANNUAL TRADE SALE**, to commence punctually at  
11 o'clock, in consequence of the large number of lots.

**MESSRS. PROTHEROE AND MORRIS** are  
instructed by Messrs. J. M. Stalton to SELL BY AUCTION,  
on the Premises, The Burnt Ash Lane Nurseries,  
Lee, S.E., adjoining the Railway Station, on TUESDAY,  
September 18, at 11 o'clock precisely, without reserve,  
25,000 Winter-blooming **HEATHS**, beautifully grown, and  
— remarkably well set with bloom buds, including:—

15,000 Erica hymalis  
5,000 " gracilis  
Large quantities of Melan-  
thera, ventricosa, pen-  
sylvanica, erecta, Caven-  
ishii, Cafra, and  
other kinds  
15,000 Small E. hymalis and  
5,000 Small E. gracilis, for  
growing on  
8,000 Solanum capsicastrum,  
in berry  
6,000 Bouvardias, single and  
double  
2,000 Genistas, very fine  
Cyclamen persicum  
2,000 Adiantum cuneatum  
3,000 Lomaria gibba, true,  
compact variety, and  
other Ferns  
8,000 Solanum capsicastrum,  
in berry  
6,000 Bouvardias, single and  
double  
2,000 Genistas, very fine  
Cyclamen persicum  
2,000 Adiantum cuneatum  
3,000 Lomaria gibba, true,  
compact variety, and  
other Ferns  
Beautifully Coloured Crotons, &c.

May be viewed. Catalogues may be had on the Premises,  
of the Auctioneers, and Valuers, 67 and 68, Cheapside, E.C.,  
and Leytonstone, E.

N.B.—Messrs. P. & M. desire to call the attention of intend-  
ing purchasers to the Stock to be offered as above. The  
Plans and Catalogues will be ready for immediate Sale, and  
the whole will be found in an equally good condition as former  
years.

**Lee Bridge Road, E.**

**ANNUAL UNRESERVED SALE** of fine Winter-flowering

**MESSRS. PROTHEROE AND MORRIS** are  
instructed by Mr. John Fraser to SELL BY AUCTION, on the  
Premises, the Lee Bridge Nurseries, Lee Bridge Road,  
Leyton, E. (close to the Hoe Street Station, Great Eastern  
Railway), on FRIDAY, September 20, at 12 o'clock precisely,  
in consequence of the large number of lots. A large  
quantity of **WINTER FLOWERING and OTHER PLANTS**,  
including:—

12,000 Erica hymalis  
3000 Tree Carnations  
4000 Erica gracilis  
2000 Ampelopsis Veitchii  
4000 fine named Hollyhocks  
from seed  
1000 Lappageria rosea superba

sire to call attention to the following **SALES**, which  
have already been fixed:—

**OCT. 10.**—At **THE MANOR LANE NURSERIES, LEE**, by  
order of Mrs. North.

**OCT. 15 to 20.**—At the various **NURSERIES** at  
**NORBITON and LONG DITTON**, by order of the  
Executors of the late Mr. Thomas Jackson.

**OCT. 22.**—At the **NURSERIES, NEWINGDALE**, by  
order of Charles Noble, six days Sale.

**NOV. 6.**—At the **HALE FARM NURSERIES, TOTTENHAM**,  
by order of Mr. T. S. Ware.

**NOV. 13 to 15.**—At the **HORSELL NURSERIES, WOKING**,  
by order of Messrs. H. & C. Cobbett.

Other Sales are in course of being arranged, and the dates  
will be duly announced.

As to other matters to call the attention of Noblemen,  
Nurserymen, and others to these Auctions, and will be placed  
to enter names on their permanent Lists for a supply of  
Catalogues.

Auction Rooms and Estate Offices, 67 and 68,  
Cheapside, London, E.C.

## Gardeners' Chronicle.

SATURDAY, SEPTEMBER 1, 1888.

### BLYTHSWOOD.

THE visit of the Queen to Glasgow and neighbourhood last week has rendered the fine residence of Sir Archibald Campbell famous as one of the few private homes of Scotland which Her Majesty has been pleased to make her temporary residence.

It is a rural place lying on the southern bank of the Clyde, curiously surrounded on its north-west and east boundaries with evidences of the commercial and manufacturing activity for which this upper reach of the Clyde is famed. A good deal of this is seen from various points of the estate. Here a shipbuilding-yard, there a manufactory connected with that industry, and though little of the river itself is seen from any part of the grounds, owing to the abundant furnishing of trees which intercept the view, the gliding of the tall masts seen over the tree-tops affords indication of the commercial activity beyond. It is a somewhat singular sensation to one bent on horticultural quest only to find himself interrupted in the admiration of a fine park tree by the towering spars of a ship, no portion of which he sees except the topmasts moving gracefully between his object and the sky-line; speculations other than the age and proportions of arboreal subjects seize the mind, but I cannot follow them further at present than to say they must be frequently indulged in at Blythswood if I may judge by the experience I had during my brief visit the other day.

Renfrew, which is the station for Blythswood, is about 9 miles from St. Enoch's Station, Glasgow, and the visitor, if he inquires the way of the railway officials on arriving there, will be directed to a private entrance from the platform to the grounds. The woods of Blythswood in this direction, in fact, reach their limit, and give a fine rural effect to Renfrew Station. The estate is extensive, and contains fine specimens of Ash, Beech, Spanish Chestnut, Sycamore, and Oak, the latter comparatively young, and remarkable for great length and cleanness of bole. The grounds are too level to be called picturesque, but the grouping of the trees and shrubs has

been so admirably managed as to break and give variety to the rather flat natural features.

Surrounding the mansion are extensive lawns, on which fine old Beeches, Oaks, Spanish Chestnuts, and other ornamental deciduous trees are studded with fine effect. Conifers as a rule do not thrive as do deciduous trees. Much has been done by the late and the present proprietors to establish some of the best types of Conifers, but success has not attended their efforts. There are, however, some excellent specimens of *Abies Alberti* and *Cedrus atlantica*, which bid fair to give satisfaction, judging from their health and dimensions to-day. Some of them are from 20 to 30 feet in height, and well furnished and vigorous.

Rhododendrons are a special feature in the furnishing of the grounds. They thrive everywhere, and are of good types, from choice named hybrid forms to selected seedlings of *R. ponticum* and *cataphractum*. With these, and the fine masses of deciduous flowering shrubs, Lilacs, Thorns, &c., judiciously distributed as they are, the place must be one of the most gay in spring and early summer.

#### MEMORIAL TREES.

Of these there are many of national interest—as, for instance, a fine thriving Lime, planted on September 27, 1875, by the late Prince Leopold on the occasion of his first visit to Blythwood; and a pair of Sycamores standing near each other, one planted by the same Prince when Duke of Albany, and the other by the Duchess of Albany, on October 17, 1882. They are both fine young trees, of about 25 feet in height. Two Limes were planted on August 24, one by the Queen, and the other by Her Grand Ducal Highness, Princess Alice of Hesse. And yet another—a stout Sycamore—was planted by the Marquis of Salisbury on the occasion of his visit to Blythwood on October 4, 1884.

#### THE GARDENS.

Lying to the east of the mansion, and a considerable distance from it, are the gardens. The way to them leads the visitor through beautiful shrubberies, and over lawns enlivened by trees of much beauty, and chiefly deciduous, till the beautifully situated house of Mr. Methven, the able and trusted gardener, is reached. Around are found fine specimens of *Cupressus Lawsoniana* in considerable numbers, many of them having a height of 20 feet, and which, unlike other Conifers here, are healthy in appearance.

Immediately beyond a fine gateway opens on a vista leading into the flower-garden. This is a charming spot, surrounded by luxuriant banks of Rhododendrons, and by walls entirely clothed, so as to appear a living screen of shrubs, with Ives in rich variety, *Ceanothus*, *Cotoneasters*, and many other foliage and flowering plants. It is of large extent, and is laid out in a free and natural style, the only feature at all approaching formal or geometric character, being a large central bed with a quadrangular base but scroll-like outline which forms the termination of the vista, and which is planted tastefully with characteristic foliage and flowering plants. Surrounding this, on the opposite side of a gravel walk, are two beautiful hedges of Golden Yew, in faultless order and symmetry. Many of the beds and borders are filled with useful things for cutting, such as Stocks, Carnations, Picotees, Pinks, &c., which, while they help to fill the vases indoors, give an air of sweetness and variety which no mere arrangement of bedding plants could impart.

#### THE KITCHEN GARDEN

is of considerable extent and well walled, the walls being well furnished with fruit trees in good order, but, unfortunately, this season they are not—as they usually are—well cropped, the only really good crops being Morello Cherries, spring frosts and adverse weather since then having destroyed almost everything else. Novel among wall fruits we observed some remarkably fine American Blackberry Wilson Junior fruiting abundantly. My opinion of this much lauded and equally condemned fruit rose considerably on seeing what it was capable of here. Small fruits, such as Strawberries and Currants, are abundant.

The indoors requirements of the garden are met in numbers of Peach-houses, vineries, early, succession, and late Fig-houses; several houses devoted to Plums, Cherries, and Apricots, Melons, Cucumbers, and Pines, all the contents of which bear testimony to Mr. Methven's skill as a cultivator.

Two houses are devoted to *Passiflora edulis* and *Stephanotis floribunda*, the latter with the remains of a fine crop of bloom upon it, and the former with plenty of fine fruit coming out. Numerous pits are devoted to succession Pines, of which the stock is fine and promising, and to the production of stocks of flowering plants of the usual stamp for winter supplies. In some also are planted out Gardenias, which were in rare health, and thoroughly clean; and in others numerous Tea Roses, planted out, which are the special favourites of Lady Campbell.

Hardy herbaceous plants form a considerable feature in the borders surrounding the quarters of the kitchen garden and other parts in connection with the flower garden. Alpine Strawberries are grown largely, and Strawberries for forcing, which were being potted up in their fruiting-pots, are done by the thousand.

#### NEW OR NOTEWORTHY PLANTS.

##### ODONTOGLOSSUM HRUBYANUM, n. sp.\*

I HAVE before me a five-flowered lax raceme. The flowers are as large as those of a very good *Odontoglossum* leave. Sepals and petals cuneate lanceolate, deep sepia-brown to horse-chestnut, with yellow tips, and the bases of the lateral sepals of the same colour. All those organs are bent down. Colours very pallid outside. Lip with a stalk adnate to the column at the base. Lamina pandurate, slightly acute, denticulate on the anterior side, light ochre, with a bilobed horse-chestnut-brown blotch before the basilar callus. Callus whitish, strong, bidentate in front, upright; an apiculus on each side at its base; a tumour on each side of the very base. Column compresso-trigonus, curved, with nearly obliterate very narrow crenulate wings. The portion near the stigma is much dilated. Colour whitish; lateral limbs of fovea reddish-brown, and a spot of the same colour under the fovea, quite transverso-pandurate, viz., bilobed towards the base and towards the apex. Anther with a keel over the mid-line.

A very careful drawing is at hand, prepared by Mr. V. Fans, the enthusiastic and very skilful grower of the possessor of the plant. It shows a plant comparable with an *Odontoglossum Pescatorei*, yet the bulb is said not to be ventricose, as it is seen some-

\* *Odontoglossum Hrubyanum*, n. sp.—Racemosum; sepalis tepalibus cuneato lanceolatis apice deflexis (semper), labello ab ungue gracili partim columnae adnato pandurato obsolete acuto lateribus denticulato deflexo; callo valde antice bidentato in basi, apiculo utrinque basia versus addito, tumore basi utrinque columnae iuxta foveam apicula; alis prope obliquis crenulatis. Ex Peru via. Hübisch, imp. exc. F. Sander, Florentina misit exc. Liber Baron Hruby de Gelsenyi. H. G. Rehb. f.

times in that plant. There are two ligulate acute leaves under the bulb, and two, one nearly attaining a span, on it, It is compressed, pyriform, with furrow 5 centimetres high by 3 wide.

It is a Sanderian introduction. Mr. Fans tells me it came from Peru in 1883 through Mr. Hübisch.

It bears the name of Baron Hruby von Gelsenyi, of Peckau, near Kolin, to whom it is dedicated with much satisfaction and gratitude. Amidst all the numerous collectors of the Continent the Baron and Consul Kienast Zölly, of Hiersland, Zurich, bear an especial stamp by their enduring love, steadiness, high intelligence, and long experience. H. G. Rehb. f.

##### ONCIDIUM JONESIANUM FLAVENS, n. var.

This very fine variety has the spots on the sepals and petals yellowish-green, and the hue on the lip and column is yellow too. It was kindly sent by Mr. B. S. Williams, of Holloway, London, who had obtained it from T. Slater, Esq., Stand Hall, Whitefield, Manchester. H. G. Rehb. f.

#### THE DEPRECIATION OF CHINA TEAS.

THE rapidity with which the taste for Indian and Ceylon Teas has spread in England is making itself seriously felt in the older Tea growing country of China. The British Consul at Hankow, referring to this subject, says:—Comparing the season 1880—1881 with that of 1886—1887, we find that the decrease in the exportation of China Teas was 23,000,000 lb., and the exportations of 1887—1888 was 20,000,000 lb. less even than this. The cause is evident; it is the increased production of better Tea in other parts of the world, especially in British India, Ceylon, and Java.

The falling off in the export of China Tea is a most serious loss of profit to the native producer and merchant, and a loss of revenue to the Chinese Government. The authorities in Peking have felt the matter to be so grave, that the Commissioners of Customs at Hankow and at the other Tea exporting ports, have been directed to make enquiries in order to find out the causes of this decline, and to suggest a remedy. As a result of these enquiries the following conclusions have been arrived at:—That Indian and Ceylon Teas are better than Chinese, although the Shanghai Tea tasters assert that China Tea has naturally the better flavour. All admit that the Indian Teas are better grown and better prepared; that they are stronger and stand more watering. On the other hand, the balance of evidence is in favour of the China Teas keeping longer than the Indian, probably because they have had more moisture extracted, the absence of which prevents fermentation. It is said, too, that the removal of moisture means the removal of tannin, glucose, and other elements which make Tea unwholesome, whence it follows that the drinking of Indian tea, in which these hurtful substances exist, is more deleterious than the use of China Teas from which they have been eliminated.

In India and Ceylon the Tea plants are grown with an amount of care and attention which would strike a Chinese Tea grower as superfluous, if not ridiculous. A soil is selected at least 3 feet in depth, so that the tap-root of the Tea plant may suck moisture from the subsoil in seasons of drought. The plants are grown in rows, so that the bushes may touch each other at the sides, while room is left at the back and front for the pickers to pass. Each bush is allowed to grow to a maximum height of 5 feet. Fertilising and pruning are carefully attended to. The latter is done with such thoroughness that as many as twelve and sixteen pickings can be got from a single bush in a year, and thus an acre of ground is made to produce the largest obtainable crop. It is said that an acre of Indian Tea garden will produce 600 lb. of Tea annually. The leaves are picked before they are overgrown, and are bruised and rolled into balls with the hand that fermentation may take place. Then the balls are broken up, and the first firing is done—if possible, on the very day that the leaves have been picked, in

order to fix all the properties essential for strong and pungent Tea. The rest of the preparation is all done by machinery, and great care is taken to have good leads and packages.

In China there is an indifference to the selection of proper soil, so that in seasons of drought there is a deficiency of sap. Old Tea bushes are rarely replaced. Manuring, removal of under-growth, and pruning, are all done in a happy-go-lucky fashion, with no idea that system and method are all essential if the growers wish to get as much Tea off an acre as is produced in India and Ceylon.

There is the same want of care and of system in the manipulation of the Tea leaf in China as there is in the growth of the plant. Every operation is done by hand only. Instead of bruising the leaves by rolling, the Chinese half dry them in the sun, and then place them in bags, which are trodden until a greenish viscid fluid exudes, which may contain some of the best elements of the Tea leaf. Days may elapse between the time of picking and of fermenting the leaf. It often happens, too, that the grower instead of picking the leaves when they are fresh and in perfection, will deliberately wait for them to grow larger, in order that their weight may be increased. It is stated that the late picking of 1887 made the crop 20 per cent. worse than it need have been. Lastly, in China there is not the same care in packing that there is in India. The remedies proposed for improving this unfortunate state of things in the Hankow Tea trade are threefold:—1st, the reduction of supply; 2nd, the adoption of a better system of cultivation and preparation; and 3rd, the abolition or reduction of taxation.

Another remedy it is said has also been suggested, namely, to drive Indian Tea out of the market by sending a lecturer through England to preach a crusade against it, and to proclaim its unwholesomeness and the danger arising from drinking it.

Whatever might be the result of a better system of cultivation and preparation, the last proposition would probably hasten its decline, by advertising, and consequently increasing the sale of, Indian Tea.

## ORCHID CULTURE.

THE following cultural notes are extracted from recent numbers of Messrs. Warner and Williams' *Orchid Album*:—

*Schomburgkia undulata* is an evergreen plant, with fusiform stems, a foot or more high, bearing lively green leathery leaves, which are from 6 to 8 inches in length. The spike is terminal, from 2 to 5 feet long, and bearing near the upper part a somewhat dense raceme of flowers. The sepals and petals are purplish-brown, much undulated, and the lip of a rosy-purple hue. It blooms in March, and the flowers continue in perfection for several weeks. This plant succeeds best when grown in a hanging basket, and roots freely in the atmosphere; it also thrives well on rafts or blocks of wood, but under these conditions it requires more attention to keep it supplied with moisture. The growth commences after the flowers have faded, and during the formation of new bulbs it should be syringed twice a day in warm weather, in order to encourage it to grow vigorously, and thus to produce white blossoms. This is usually considered a shy-flowering species, but if grown with full exposure to the light there need be little fear but that it will bring forth its flowers annually. In a state of Nature this plant is found growing upon trees and on rocks in exposed situations, where it is subjected to a decided dry and rainy season, the latter being its time of flowering and growing, at which period it requires great care and attention to keep it properly supplied with moisture; but after growth is completed, just a moderate quantity only is requisite in order to keep the bulbs and leaves from shrivelling and becoming impoverished. We find the temperature of an intermediate-house to suit it admirably, and that it does not appear to like much soil about its roots; this should be the same as we have previously recommended for Cattleyas.

*Dendrobium Fytchianum roseum* is a distinct and

pretty deciduous variety. The stems are slender, cylindrical and erect, from 1 foot to 15 inches high; the young growths appear about the same time that the flowers begin to show upon the leafless stems of the previous year, so that, although the plant is deciduous, the flowers are accompanied by the green leaves of the new shoots. The flowers are produced both on terminal and lateral racemes, and are of a delicate rose colour, the throat being of a darker hue. It blooms during the months of February and March, and continues in beauty some considerable time. This variety, like the species, is best grown in the East India house, suspended from the roof, in such a position that it may obtain the full influence of the light, but it will require a little shade at mid-day, when the sun attains its greatest power. We find small pans or baskets admirably adapted for this and similar small and tender plants. It requires but a small amount of material about its roots, and this should consist of rough fibrous peat and living sphagnum moss, which should always be kept in a sweet condition by good drainage—stagnant material about it often causes sudden death, but more often leads to an unhealthy condition, in which the plants gradually dwindle away. It requires a liberal supply of moisture during its growing season, and also slight syringing in the morning and again in the afternoon. This assists in keeping away red-spider, which frequently attacks these small tender-leaved plants.

*Cattleya Harrisonia violacea* is a charming evergreen variety, resembling the typical plant somewhat in its growth, but is sometimes taller. It also has the peculiar habit of making two growths in one season, and often flowers are produced upon both growths. Thus its seasons of flowering may be said to be in April and May, and again about July, August, and September, lasting in full perfection for about four weeks. It is a very useful plant, both for home decoration and for public exhibition purposes. The sepals and petals are of a rosy-purple; lip same colour, stained with yellow in the centre. This *Cattleya* thrives well when placed at the coolest end of the intermediate-house, where it can obtain full exposure to the light, but it requires shading from the sun during the hottest part of the days in summer. The material we use for this plant is the same as that of the majority of Cattleyas; that is, a good fibrous peat and sphagnum moss. It may be grown in either a pot or basket, but must have perfect drainage. A moderate supply of water is necessary during active growth, and when that is completed, just enough moisture to keep the bulbs and foliage in vigorous condition is ample. When the plant shows signs of renewed growth, increase the water supply, to induce the formation of new roots, and thus the growths will become stronger.

*Houlletia Brocklehurstiana* is a handsome and showy species, growing to upwards of 2 feet in height, and has a conical furrowed pseudobulb, which bears a single broadly lanceolate light green leaf. The flower-spike proceeds from the base of the bulb, and is erect, some 12 inches in height, bearing numerous very fragrant nodding flowers, which are nearly 4 inches in diameter. Sepals and petals rich sienna-brown, spotted with dark purplish-brown; lip yellow, profusely spotted with the same colour as the other portions of the flower. They are deliciously sweet, and continue in beauty about a fortnight. This species is of free growth, and thrives well in an intermediate or Cattleya-house, but it grows equally well with us in the Odontoglossum-house, where it flowers abundantly. The bulbs of this plant should be well matured; this is of special importance if good results are expected. Let the plant have its growing season at the proper time, and encourage it as much as possible to throw up new growths, which should appear about the time of flowering. During active growth it requires a moderate supply of water to its roots, but when the growth is completed withhold water, and allow the plant to have a thorough rest, always being careful to avoid distressing it. When the flower-spikes and young growths begin to show, gradually supply water

regularly, in order to assist the blooms and enable it to make good growths for another season. This plant requires shading from the hot sun, but this must be done with a very thin material, as it likes good exposure to the light. We find rough fibrous peat and living sphagnum moss a fine compost for it, adding some nodules of charcoal, and draining well. The roots enjoy a great deal of freedom, therefore elevate the plant well above the rim of the pot, to encourage them to ramble.

*Vanda lamellata Buxalli*.—This small-growing Vanda, like several others which we have already figured in the *Orchid Album*, requires more care than some of the larger-growing kinds which we have enumerated above; that is to say, it thrives best when grown in baskets or in pots suspended from the roof near the glass, or if not suspended the plants should be arranged upon the side tables, where they may obtain an abundance of light. A thin shading in order to break off the sun's rays will be, however, necessary for the well-being of these plants, but the shading should never be down when the sun is not shining; attention to these few remarks will tend to produce strong and robust growth, and a profusion of flowers. On the other hand, if they are too heavily shaded, the foliage becomes weak, the growth does not ripen, and consequently has not strength to flower; besides this it often causes the bottom leaves to fall off, and thus the plants lose much of their ornamental appearance; for a well-grown Vanda is an extremely beautiful object, even without its blooms. This plant, being a native of the Philippine Islands at no great altitude, requires the heat of the East India-house, and enjoys a moderate supply of water during its growing season, which is in the summer months. In the autumn and winter less water will be necessary, but as these plants are growing more or less all the year round, and have no thick and fleshy pseudobulbs to support them through a period of drought, the material must always be kept in a moist condition. We find living sphagnum moss the best material in which to grow this plant, and the pots or baskets must be well drained.

*Dendrobium macrophyllum*.—This plant grows naturally in the jungles of Java, in situations where it is both hot and moist nearly all the year round, consequently the warmest end of the East India-house will be found the most suitable place in which to cultivate it. Whilst growing, it must be abundantly supplied with water; after the growth is finished it must not be kept entirely without moisture, but just enough to keep the plant from shrivelling, and to ensure healthy foliage, will be sufficient, and in the spring of the year its flower-spikes will be developed. This plant begins to make new growth soon after it has flowered, and this is the proper time to repot it, if requisite. Never allow stagnant soil to remain about its roots; if the plant should fall into bad health, it should be shaken out of the old soil, or the roots washed, and any decaying or decayed parts should be cut away, repotting in sweet fresh material with good drainage. It requires but little soil to grow in, and we find good fibrous peat and sphagnum moss the best material for it. Shade is very essential to this plant during the summer, as doubtless in a wild state it obtains partial shading from the surrounding trees. This plant does not like being much disturbed, and if it is in a healthy condition there is really no necessity to do so.

*Cypripedium Amesianum*.—As before remarked, this plant thrives best when grown in the Odontoglossum-house, in a temperature ranging from 45° to 50° of heat, during autumn and winter; indeed, the same temperature during the whole season as that given the *Odontoglossums* of the *Alexandra* (crispum) type, with a good supply of moisture to the roots during the growing season (which is nearly all the year round), suits this plant exactly. A slight syringing overhead during the spring and summer will also be found advantageous. In order to produce strong or healthy foliage, the plant should be exposed to the full light, but it requires to be shaded

from the bright sun during summer. The material we find to suit this plant is good fibrous peat or leaf-mould, adding a small quantity of turfy loam; the whole should be well incorporated, and the pots well drained before the soil is put into them. Good drainage is particularly important for *Cypripediums*, or the roots are very apt to decay, and without good roots it is not possible for a plant to remain in a healthy condition. This plant is easily propagated by carefully taking off the young side shoots, but these should be rooted before they are removed from the parent plant; this operation is best performed after growth is completed, or when the plants are at rest. The young shoots should be put into small pots, and placed in a warm house until they are thoroughly rooted and well established, after which the cool-houses is best adapted to their requirements. These plants must be kept free from all insects, or they will become permanently disfigured.

*Masdevallia Harryana decora*.—This variety requires the same treatment as the species, that is to say, it should be grown in a pot with ample drainage, and the potting material should consist of fibrous peat and living sphagnum moss. It requires a liberal supply of water during active growth, after which a much less quantity will suffice, though care should be taken to prevent its ever becoming dry, and to keep the soil moderately damp at all seasons. We find it advisable during the winter months to keep *Masdevallias* somewhat warmer than the *Odonoglossums*; they are plants that enjoy plenty of light, but require to be shaded from the sun. These plants are easily increased by dividing the creeping stem with a sharp knife, but avoid cutting the roots; these must be separated by the hand, and the operation is most successful when performed on vigorous plants, just before starting into growth. These plants are subjected to the attacks of insects, which are very injurious to them if not speedily destroyed, more especially during the time they are making their young growth and are producing their flower-spikes.

Aphids and thrips increase very rapidly if not kept under. We find fumigating with tobacco-paper is not good for the plants, but we have found the use of tobacco-steam, as applied in a new apparatus, which we have introduced into this country, called the "Thanatophore," most beneficial in destroying these pests, moreover it does not injure the young growths or flowers. These insects, if allowed to remain on the plants, cripple the flower-buds and young growths so much that they are prevented from opening and attaining their proper size; besides which they are a great disfigurement to a collection of plants.

*Cattleya Lawrenceana*.—We cultivate this *Cattleya* in the same heat as the East Indian plants, suspended near the glass in a stove, where there is but little shade, and where it appears to thrive well. When in bloom it is removed to the *Cattleya*-house, to be replaced in its old quarters when the flowers are past. In all probability this *Cattleya* would do well at the warm end of an intermediate-house, but its wild habitat suggests the necessity of a little higher temperature, and it also requires to be shaded from the hottest sun in order to preserve its leaves of a good colour, which is a very essential point in the cultivation of *Orchids*. In the matter of potting, it requires the same material as recommended for *C. Mossiae*, viz., good fibrous peat mixed with a little sphagnum moss, and with perfect drainage, as the plant requires a fair amount of water in the growing season; but during rest very little will suffice, indeed just enough to keep the plants from shrivelling and in a healthy condition being all that is necessary; and in spring, when the flowers begin to show, the plants will then be much benefited by a little extra water to encourage their blossoms to open.

*Batemannia Colleyi* is a dwarf, compact-growing plant, forming dark green buds about 2 inches high, and bearing similarly dark green leaves about 8 inches long. The flowers are of a curious form, borne upon short spikes, which spring from the sides of

the bulbs near their base, and which form a cluster round them; sepals and petals purplish-brown, and the lip white, tinged with rose. Its flowering season is during the months of March and April, and the blossoms continue in beauty for a considerable time. This species is by no means difficult to cultivate; it should be treated as a pot plant; and be well drained, the best material we can recommend to plant it in being good fibrous peat and sphagnum moss. It should be elevated some 2 or 3 inches above the rim of the pot, and treated to the temperature of the intermediate or *Cattleya* house. During the growing season a moderate amount of water is essential to its well-being, but during the dull days in winter a partial drying is equally necessary, while its resting must never extend to the shrivelling of its bulbs. If it is more convenient, this plant will grow equally well in a hanging basket; but we have suggested pot culture on account of its clustered flowers, which are seen to better advantage grown in this manner.

## LITHOSPERMUM GRAMINIFOLIUM.

ONLY three of this section of *Lithospermum*—that is, hardy evergreens—are well known in cultivation: *L. prostratum*, *L. rosmarinifolium*, and the subject of our present note—the first and last being by far the most common, though we have several times seen the Rosemary-leaved species growing vigorously, and giving promise of a good alpine. *L. prostratum* is a good plant for half-shady spots on the rockery, and when seen in large patches the intense blue of its charming flowers is exceedingly attractive, continuing more or less in beauty from spring until autumn. The fault of losing the lower stem leaves so quickly, leaving bare unsightly patches here and there in the clumps, is a very bad one, as the task of renovating without lifting the whole is very difficult. *L. graminifolium* (fig. 27) is entirely different in habit and aspect; it forms dense tufts of glaucous grass-like leaves, making a pretty picture in the alpine garden. It flowers May and June, and when well established gives little trouble, and produces its drooping bunches of sweet blue flowers in profusion. It is far from being easy to propagate; dividing the tufts is very dangerous, and must be done carefully. A native of Italy. Our illustration was taken from a plant kindly forwarded by Messrs. Backhouse, of York.

## PLANT NOTES.

### COSTUS SPECIOSUS.

THE genus *Costus* is not much known in gardens, the only species to which any attention has been paid being *C. igneus*, which was distributed by Mons. Linden a few years ago. A plant of *C. speciosus* now in flower at Kew is handsome enough to be recommended as a stove flowering plant. It has stems 5 feet high, 1 inch in diameter, with the appearance of Bamboos, but succulent. The leaves are arranged spirally upon the stems, each leaf being 1 foot long and 5 inches wide, smooth, green above, soft downy beneath. The flowers are in a compact terminal head, each one being 2½ inches long, tubular, and 1½ inch across the mouth; the large lip-like petal has a crisped margin, suggestive of a *Sobralia*. There were four flowers open on one stem when we saw it, and there were a great number of buds to expand. The figure of this species in Roscoe's *Scitamineae* gives a poor idea of the size and beauty of the plant. *C. igneus* is also in flower at Kew. *W. W.* [This plant and *C. imperialis* are effective as subtropicals, if due regard be paid to gradually inuring them to full exposure. Ed.]

### EICHORNIA TRICOLOR.

as grown at Kew, is a pretty stove aquatic, quite up to the standard of *Limnorchis*, *Sagittaria*, and the other *Eichornias* and *Pontedericias*. It is nearly a yard high, and has large cordate shining green leaves;

the flowers are in erect spikes, each one being an inch across, and a mixture of purple, red, and yellow. There is a large group of it in one of the corner beds in the Water Lily-house at Kew, which is, to our taste, as strikingly pretty as anything we have seen for a long time. This species is no doubt an annual.

### NYMPHÆA VOALEFOKA.

This is one of M. Marliac's introductions, presumably from Madagascar. It is evidently a white flowered form of the variable *N. stellata*, there being no difference between the two in any point except colour. A plant of *N. voalefoka*, is now in flower in the Water Lily-house at Kew. *N. Starkevianii*, *N. tuberosa flavescens* (*N. Marliacea*), and *N. stellata rubra*, as well as numerous other kinds, are also now flowering freely at Kew. *W. W.*

### ALLIUM PARCIFLORUM.

I have in bloom a small bulb which is of sufficiently rare occurrence, according to Mr. Baker, of Kew—who kindly named it for me—to make it worth a record in your journal. It is *Allium parciflorum*, a native of Corsica, from whence it was sent to me. Mr. Baker says, "It is endemic in Corsica, and I have never seen it alive before. It has never been figured, and I am not aware it has ever been cultivated in England." *Rev. A. Rawson, Windermere.*

## FRUIT REGISTER.

### APPLE WHITE PARADISE.

WHILE welcoming new varieties of fruits, do not let us, in our zeal, discard old varieties till we have thoroughly proved their inferiority. This season, when one looks upon trees of approved kinds with hardly a bushel on them, this Apple, the White Paradise, or Lady's Finger, or Egg Apple, turns out to be a good one; it always bears, and is in season all through the winter. We have several trees here with a fine crop, and I need not say how useful they will be this year. Many people, probably, will not thank me for raking up this old kind when there are better to be had, but we cannot do without such as this to fall back upon in adverse seasons or exposed situations. Our garden here is 400 feet above sea-level, on a ridge, and is very exposed, and hardy kinds are very essential. I understand that White Paradise grows in Scotland. We were all surprised at the last Apple Congress when King of the Pippins stood at the top of the class with the highest number of marks; but it no doubt was its hardness, and general bearing qualities, which gained it this distinction. Another Apple not nearly sufficiently grown is Galway Pippin. *J. Rust, Eridge Castle.*

## GRASS EXPERIMENTS.

By the courtesy of Messrs. Sutton, we visited in the course of the summer, their extensive seed trial grounds at Reading, which comprise some quarter of a million illustrations on agricultural and horticultural productions. Those to which we devoted especial attention on this occasion were the grass experiments.

The first series comprised 150 varieties of grasses, ninety-nine of which are British species; these were grown in small plots side by side under exactly similar treatment, for the purpose of testing both their durability and suitability for permanent or temporary pastures.

Several of the varieties are of German origin, and promise eventually to be a great acquisition to the English cattle-grazier. Perhaps one of the most marked of these is *Alopecurus nigricans*, a later variety of Fox-tail grass than *Alopecurus pratensis*, which although extremely valuable where an early bite is required, yet when left for hay is frequently past its best when the other grasses are ready. *A. nigricans* has a more leafy habit, is taller in foliage, and better adapted for general pasturage.

The next we noticed was *Agrostis vulgaris* var. *nigra*, a valuable variety with abundance of good foliage, promising to give a remunerative amount of hay, and excellent for feeding.

Our ordinary *Anthoxanthum odoratum* (Sweet Vernal grass) is nowhere considered a very valuable variety for hay, notwithstanding the delicate aroma it imparts to the hay-rick, for it gives but a thin and scanty crop, and the seeds are most frequently shed before the crop is cut. Messrs. Sutton are, however, trying their skill upon a later and more promising variety of this grass, having much broader and more robust and abundant foliage, with flowering-spikes nearly 3 inches in length.

One of the most important items for the consideration of farmers is the time of cutting their grasses.

some new pastures is doubtless traceable to grave faults in the prescription of the grasses sown, and to the difficulty of obtaining reliable data upon this point. Six beds have been laid down, which are now of three years' standing.

In three plots the mixture included 6 lb. of *Lolium perenne* (Rye grass) and 2 lb. of *Dactylis glomerata* (Cock's-foot).

In the other three plots the mixture included 6 lb. of *Dactylis glomerata* (Cock's-foot), but no Rye-grass, and it is a significant fact that, in each case when *Lolium* formed part of the grass-seeds sown, the herbage is superior, containing a larger proportion of clovers, while *Dactylis* and the Fescue grasses are now a distinct feature of the plots, whereas on those where *Lolium* was excluded, Cock's-foot and

surrounding the residence of Mr. Martin J. Sutton, he by the aid of Dr. J. Voelcker inaugurated a series of experiments on six grass fields at Dyson's Wood, Oxfordshire, with such quantities and combinations of manures as might be reasonably applied in ordinary agricultural operations, and such as any grass-land farmer might be expected to be willing to go to the expense of in the event of their proving successful.

The present is the third year of the investigations, and the lessons taught may be briefly summarised as follows:—

1. The absence of manure means corresponding absence of leaf, and concurrently the early maturity of flower-heads.
2. The quicker action of nitrate of soda as compared with sulphate of ammonia.
3. The stimulating effect of ammonium salts upon Cock's-foot grass, this species yielding, when so manured, from 80 to 90 per cent. of the total herbage.
4. The suitability of gypsum as a manure for maintaining a Clover plant.
5. The lasting effects of muriate of potash and bone manures contributing largely to the successful growth of bottom grass and Clovers.
6. The evanescent action of guano on such porous soils as some of those at Dyson.
7. The phosphates of coprolites are more readily taken up by the mixed herbage of grass land than are the phosphates of basic cinder. *John J. Willis, Harpenden.*

## COLONIAL NOTES.

### ACCLIMATISATION SOCIETY OF QUEENSLAND.

A BOTANICAL Museum has been erected at Brisbane intended for the display of specimens of economic botany and illustrations of agriculture and horticulture. The garden under the management of Mr. Soutter is well stocked, and the distribution of useful and ornamental plants has been carried on successfully, not fewer than 17,000 plants having been distributed to members.

The maximum shade temperature was in February 92° 6; the minimum temperature 37° 4 in August. The rainfall of the year amounted to 81 inches, 23·3 of which fell in January, while in June little more than a tenth of an inch was measured.

#### JAMAICA.

The *Bulletin* of the Botanical Department, Jamaica, for June, under the editorship Mr. Fawcett, contains full reports on Annatto-culture and Sugar-boiling. The Director remarks that the *New Bulletin* will be found indispensable by tropical agriculturists.

#### COLD WEATHER IN NATAL.

On the night of May 23 we experienced a sharp frost—I noted 2°, an amount rather uncommon for this locality, which is 2300 feet above the sea. The effects on a few plants in an open exposed situation are noted as under:—

##### Leaves Blackened.

Bananas  
*Brugmansia suaveolens*  
French Beans  
*Ficus natalensis*  
*Caladium esculentum*  
*Hydrangea hortensis*  
*Leonotis leonurus*  
*Physalis edulis*  
Sweet Potato  
Tomatoes  
Tuberose

##### Untouched.

*Cyrtanthus Mackenii*, in flower  
Cape Helle (Babiana, Freesia, Ornithogolum, Ixia, Sparaxis, Nerine), in leaf  
*Gerbera Jamesoni*, in flower  
*Habrothamnus elegans*, do.  
*Heliotrope*, do.  
*Lachenalia tricolor*, do.  
*Poinsettia pulcherrima*, do.  
*Salvia Van Houttei*, do.  
*Solanum jasminoides*, do.  
*Tecoma venusta*, do.  
Tea Roses, do.

In a wet low-lying place a few miles from here, much more cold was felt—not less than 3° to 5°. *Crinum* capense, which grows thereabouts, was quite safe, dormant underground. The cold snap was accompanied by a dry raging north-west wind coming from the snow-covered Drakensberg Mountains, 80 miles away. *Poinsettia pulcherrima* bore wind and frost well, and now (second week in July) it is still perfect in leaf and flower. The soil everywhere is ankle deep in dust, hardly any rain having fallen in Natal since March. The total rain-

FIG. 27.—LITHOSPERMUM GRAMINIFOLIUM: HARDY PERENNIAL: FLOWERS DEEP BLUE. (SEE P. 236.)

This, of course, must always vary in different localities and in different seasons, but from numerous experiments made in the trial grounds of Messrs. Sutton, it is found that the best hay is made from grass just before the flower-heads have begun to turn colour. At this period also many of the varieties have been found to contain nearly double the quantity of nutritive matter than after they have shed their seeds.

The next series were arranged for the purpose of testing the comparative value of sowing grass seeds with or without a corn crop, the grain selected being Oats. The present season is the third after laying down, and the total weight of hay in each case has been much the larger, and the quality of the herbage better without than with a corn crop, as many of the finer grasses and clovers were driven out by the exhausting character of the Oats.

One prevalent cause of the early deterioration of

the better quality of grasses have almost died out. This is a matter of great importance, and the inference to be drawn from these experiments is, that Rye-grass fosters the growth of other varieties, and aids the general progress and development of those grasses which are slow in coming to maturity.

#### EXPERIMENTS WITH MANURES ON PERMANENT AND TEMPORARY PASTURES.

This branch of agricultural practice has within recent years occupied a considerable share of the attention of both proprietors and tenant farmers; and although much knowledge upon the subject has been gained by the elaborate grass experiments of Sir J. B. Lawes and Dr. J. H. Gilbert at Rothamsted, yet there is much to be learnt, and great need for improvement in our meadows and pastures.

For the purpose, therefore, of ascertaining by actual trial what manures were best for such poor land as that

fall in Maritzburg for May was the 98th part of an inch. Contrast this with the 15 inches which fell during May close to Cape Town, and one sees the chief cause of the vast difference between the flora of Eastern and Western South Africa. *R. W. Adam, Maritzburg, Natal.*

#### NATAL PLANTS.

It is always pleasant to see your Natal correspondents' jottings, especially when he covers new ground. In the friendliest way, however, I must take exception to his comparative lists of local representative plants on p. 649, vol. iii. 3rd ser. as containing errors of plant distribution. *Metalasia muricata* covers acres of the Cape flats, and is common all along the littoral slope; *Protea cynaroides* is a Table Mountain plant, and runs right up into the Katberg region; *Struthiola ovata* is common in Stellenbosch and Caledon, and *Sesago corymbosa* is to be met with everywhere, west and east. These, then, will by no means do for a local Grahamstown list. Then of those assigned to Maritzburg, the *Clerodendron* is also a Kowie plant within 30 miles of Grahamstown; *Disa polygonoides* and *Ochna atropurpurea* both grow plentifully at Grahamstown; *Pentstemon*, a Katberg plant, runs west to the Bedford Mountain; and *Strobilium speciosum* further still—to Boschberg and Bruintjeshoogte. To the list of typical plants of the extreme south-west—say, Cape Town—there need be no demur. Nearly the whole question of difference between the west South African and east South African floras lies in the monsoon character of the rainfall—winter rain in the former, summer rain in the latter—and the two different oceanic currents which wash the respective coasts. The derivation of the two floras is another matter. The prefaces to Ernest Meyer's *Commentaries on Dregé's Distributed Plants* and the *Documente* with Mr. Bolus' sketch of Cape plant-geography in the Cape official Handbook, will be the best guides to differences in the two sides of this end of this continent, and their bearing on horticultural matters may be readily inferred. *C. B. S.*

#### SAINT LUCIA.

We have received the first annual report of the newly formed Botanic Garden in this island. Mr. Gray has made a good commencement, and is already in a position to supply planters with Cocoa, Coffee, Nutmegs, Vanilla, and other tropical plants. It appears that Saint Lucia has heretofore imported Coffee from Jamaica which might be grown on the island equally well.

#### CEYLON TEA, &c.

From Dr. Trimen's annual report we learn that Tea has become the leading industry of the colony, 180,000 acres being occupied with its culture. Coffee has declined in proportion as Tea has extended. Cinchona bark is also very largely exported, though the low price obtained renders it now unprofitable. Indian Rubber trees (*Hevea brasiliensis*) have produced seed freely in the island.

#### CINCHONA IN INDIA.

A "resolution" of the Financial Department, signed by the Secretary to the Government of Bengal, gives a succinct account of the introduction of the Cinchona into India, and of the progress of the cultivation of the tree. The discovery of the value of cinchonidine, and of cinchonin, as febrifuges of equal value with quinine, is also mentioned, and credit claimed, and justly, for the preparation of "Cinchona febrifuge," a powder which contains the three alkaloids of red bark mixed in the proportions in which they naturally occur in the bark. The document closes with a well-earned tribute to Dr. King and Mr. Gamble.

**NOVA SCOTIAN APPLES.**—The Canadian correspondent of the *Liverpool Journal of Commerce* writes:—"Apple growers in Nova Scotia say that the maturing crop will be the largest and best that they have had for many years. August Pippins are early in the market."

## HARDY FLOWERS FROM HOLLAND.

MR. C. J. VAN TUBERGEN, jun., has sent me another box of hardy plants from his garden, comprising a selection of Lilies and a few other choice flowers. The most important are the best forms of *L. longiflorum*. The varieties *Harrisii* and *Wilsoni* do not differ in the size or form of the flowers, both producing flowers 7 inches in length, and of great purity; *L. longiflorum Takesimæ* has flowers of great substance, of large size, but an inch shorter than the two first-named; *L. tigrinum splendens* and the double-flowered form are in capital condition. A handsome spike of *L. Leichlinii* is also sent; it is so like the flowers *L. tigrinum* group in form that it might be classed as a yellow variety of that fine species. This is one of Messrs. Veitch's introductions from Japan, sent with *L. auratum*, and was first flowered by them in July, 1867, and named by Sir Joseph Hooker in honour of M. Max Leichlin, of Carlsruhe. Mr. G. F. Wilson has produced some handsome examples of it. There is also sent an immense spike of *L. superbum* with no fewer than nineteen flowers. It is the true *superbum*, but this species varies much in the density of the numerous black spots on the petals. It is known by its ivory-white bulbs.

Mr. van Tubergen has sent *Calochortus* flowers and another species. These with us are excellent pot plants, but they seem to do well in the light sandy soil of Holland. Also a fine head of *Tritoma corallina*, a small flowered pretty species; and two forms of *Montbretia*, viz., *M. Pottsi* with slender spikes of orange-red flowers, which I see are described as crimson-scarlet in a list before me; and *M. crocosmiflora*, with much larger flowers. These are handsome herbaceous plants; grand examples are to be seen in a shady peat border at Glasnevin near Dublin.

*Calla (Richardia) melanoleuca*, with pale yellow flowers, and a black centre, is a striking plant. A few other hardy flowers are sent, the whole of them exemplifying the value of hardy flowering plants in August. In our own garden we have some of the foregoing in flower, and also the crimson and purple *Monarda*s, which are always striking objects in the herbaceous border in August, and are of easy cultivation. *J. Douglas.*

## THE HERBACEOUS BORDER.

### HERBACEOUS PHLOXES.

NEVER, perhaps, were these seen in finer condition than this year, the frequent heavy rains and cool weather having suited them. The earliest to bloom are those of the suffruticosa section, but the most stately and effective for border work are those selected and raised from North American species, which come in later, and are most valuable in producing a display all through the autumn, when their varied and brilliant colours are exceedingly telling.

The most suitable place for these latter is immediately in the foreground of shrubs or at the backs of borders; but it should be borne in mind that wherever planted they must be free from the roots of trees for the Phloxes to do any good, as, besides requiring all the moisture they can get, they need rich soil, and always look poor and poverty-stricken when they are robbed. This being so, any intended for special purposes, such as for show, or to produce large heads, are best treated in rows in a part of the garden by themselves, where they are handy for water and can be attended to easily and have liberal supplies of liquid-manure as soon as they begin to show bloom. In preparing for them, dig out a trench as if for Celery, by throwing out the top spit and working in below a liberal dressing of rotten dung, when after filling up the trench to nearly the original level, the plants may be planted. Although the proper time to do this is in the spring, it may be effected during the autumn, as soon as the flower-heads fall or die off, when the stems may be cut

away, and the crowns divided, and each portion will grow. Cuttings also strike freely, if made from the young shoots, and these may be pulled off with roots; obtained in which way, or from cuttings, plants produce finer heads of bloom. To get the cuttings to root, all that is necessary is to put them in in sharp sandy soil, under a hand-light in any shady position; or the striking may be expedited by giving a little heat in a frame. Herbaceous Phloxes also seed freely and produce much variety when raised in that, but to have any really good, seed should be saved from the very best kinds, and gathered immediately it is ripe, which is also the right time for sowing. This may be done in boxes or pans, filled with fine sharp sandy soil, and if these are then stood in a warm pit or frame, and the soil kept properly moist, the plants will soon appear, and directly they are large enough to handle they should be picked off in pots or pans, similarly prepared, and then placed close up to the glass, in a cold frame, for the winter. Some of the leading nurserymen make a specialty of the Phloxes referred to, and those who would start well with them ought to get a dozen or two of the finest-named sorts, as much improvement has been effected in them of late years; and if the selection is to be left to the growers' satisfaction is almost sure to be given. *J. S.*

## CULTURAL MEMORANDA.

### PANCRATIUM CARIBÆUM.

THIS distinct and beautiful *Pancretium* from the West Indies, has pure white and very fragrant flowers, and should be grown by every body in possession of a plant stove. It is increased by offsets potted up in sandy loam, and grown in the ordinary way, giving water when necessary during the growing season, and keeping the foliage free from the attacks of thrips. Strong flowering bulbs may be obtained from the leading plant nurserymen at from 2s. 6d. to 3s. 6d. each in the autumn, which being potted in efficiently crocked 6-inch pots in—as already stated—good sandy loam, and treated as indicated, will flower next year. This is a grand decorative plant; the individual flowers are also very useful for bouquet making as they wire well. Liberal applications of tepid liquid-manure being given at the roots while the plants are growing, will conduce to the production of finer flowers than would otherwise be secured.

### SANCHEZIA NOBILIS VARIEGATA.

Cuttings of the young growths of this very useful decorative plant, taken off any time during the spring, summer, and autumn months, inserted in small pots filled with sandy soil, placed in heat, and watered, will soon root. They should afterwards be potted singly into 3-inch pots in a mixture of peat and light sandy loam, watered, and returned to heat, placing them near to the glass and keeping them supplied with moisture at the roots and overhead when necessary. The deep green midrib and bright red veins of the Croton-like leaves of this plant render it a very suitable subject for table work, &c. *H. W. Ward.*

### COREOPSIS LANCEOLATA.

The annual varieties of *Coreopsis* are pretty well known and much grown in gardens, but good as they are they are far exceeded in usefulness by some of the perennial kinds, one of the best of which is *C. lanceolata*, which I had the pleasure of seeing the other day in full beauty, in Mr. Thomson's seed grounds, at Ipswich. The plants there were in rows, forming a large group or bed, and were a mass of bloom, the individual flowers being about the size of a five-shilling piece, and of a rich shade of satiny yellow. There is another species of *Coreopsis* closely resembling this, named *C. auriculata*, and both are highly desirable for planting in the herbaceous border, where they would be sure to make a grand show. Both of these kinds seed profusely and may readily be increased in that way, or by division,

as they spread quickly and send up a great number of stems. Like most perennials or herbaceous plants they delight in rich deep soil, and succeed best where they can have plenty of moisture.

#### MONTBRETIA CROCOSMIFLORA.

This is a beautiful Iridaceous plant, much too seldom seen in gardens, and is a much brighter and finer kind than the better known *M. Pottsi*, as it has considerably larger flowers of a more brilliant hue, partaking of the colour of the last named and *Tritonia aurea*, from both of which the plant has been raised; and it ought, like the latter, to be sufficiently hardy to stand the winter if planted in a sheltered spot out-of-doors, as in a border under the foot of a wall the *Tritonia* does remarkably well with us, and affords scores of spikes for cutting.

The habit of *Montbretia crocosmiflora* is spreading, and the plant has leaves very like those of the *Gladioli*, and the flowers are borne on stout branching stems, in the same way as those of the *Tritonia*. The soil most suitable for growing the *Montbretia* is a rich deep sandy loam, in which the creeping roots run and spread freely, and if left out for the winter it is advisable to protect by laying a few inches of leaf-mould over the bed. If grown in pots the same treatment required for the *Tritonia aurea* will be found the most suitable, and that is to stand the plants out in the open during summer, as under glass they are apt to suffer through red-spider attacking the foliage. *J. S.*

### FELIXSTOWE.

[SEE SUPPLEMENTARY SHEET.]

Let those in search of a sensation betake themselves to the town of Ipswich in early June, and then avail themselves of the branch railway to Felixstowe. They will not have gone far before they find themselves traversing immense Gorse-covered commons, so radiant with glowing colour, so heavy with rich perfume, that there is no difficulty in realising the statement made, that Linnaeus, astounded at the sight, rendered thanks to God at the prospect of an English common. Dull, indeed, must he be who could pass unmoved such a sight as that of these extensive commons when ablaze with Gorse-blossom.

That is sensation number one, only to enjoy it to the full you must be there almost to the day. We passed those same commons only a few days later to find their radiance wonderful indeed, but perceptibly less than before, and the rich full golden hue of the Gorse giving place to the thinner, paler, more translucent yellow of the Broom. A few minutes more and the train passes through the Orwell woods—another sensation for the tired eyes of a cockney—and then, emerging from these woods, the train comes to a halt at Felixstowe. What a place! Did ever heart sink lower than ours at the first sight of this dull, dreary, dusty place, with apparently all the horrors of a place of seaside lodgings without any of its advantages. The “shatterdan,” guiltless of paint and never cleaned, and the raw-boned steeds, looked appropriate certainly, but not alluring. However, the animals moved along at a pace far from consistent with their woebegone appearance, and just as we were wondering where we were going to, and how much further off our goal could be, a gleam of many-tinted colour glinted through the trees, contrasting exquisitely with the soft tender hues of the foliage, a cosy-looking hotel opened its hospitable gates, and we were taking our rest in the hostelry presided over by Mr. Quilter, whose taste as a gardener was known to us before, and whose skill as a caterer we found to be on a par with his love of gardening. It is astonishing how quickly the charms of that comfortable place made us forget the depressing impressions caused by our first descent upon the sand dunes. A very short time and we found ourselves purring with content and saying that it wasn't such a bad place after all. We would sleep upon it, and decide in the morning. And decide we did, our decision being in no slight measure

influenced by the pretty garden, a portion of which is shown in our illustration. There are, as we soon found, all sorts of attractions at Felixstowe for the geologist and those fond of natural history and bracing air—red cliffs so crammed full of fossils that a penknife's blade is all too thick to pass between shell and shell. Besides, there is a sort of curious Hibernicism about the whelk-shells of the Crag (*Fusus contrarius*). They are many of them left-handed, and this deviation from the ordinary course of things fits in well with the holiday topsy-turvy spirit and the desire to cease, for a time at least, the daily right-handed routine. Then there are the golf links within a walk, and the sand-hills and the miles of sea-coast, all so full of varied interest to the botanist. Not far off is Harwich, quaint and Dutch-like except in its dirt, and there is the shipping and the ride up the Orwell, and the charming park of Wolverton, and the glorious woods of Orwell, and much besides that it would not be in place to mention here.

The spring garden which attracted so much of our attention is of large dimensions. Trees and grass and the softness of the well-blended colours take off from the formal regularity which otherwise might be objectionable, and constitute a picture, the charms of which frequent inspection only served to enhance. The photograph, taken when the trees were still leafless, shows the general plan to consist of a semicircle of triangular beds, with a central grass-plot, while the boundaries of the garden are backed up with trees and shrubby borders, with lines of spring flowers in front. Here are some of the combinations seen in these triangular beds—a groundwork of blue *Myosotis* dotted with white *Tulips*, surrounded by a band of white *Arabis*, and then by a similar band of *Silene pendula*, with a Box edging as an outermost boundary. In another triangle the groundwork was a mass of purple *Aubrietia*, in the centre of which was a circle, consisting of *Silene pendula*, dotted with *Hyacinths*, and edged with *Golden Feather*. In each corner of the triangle were smaller triangles, filled like the central circle.

These illustrations may suffice to indicate the contents of the beds as we saw them. Crocuses had had their day, Wallflowers and Daffodils were going off, *Hyacinths* were on the wane, and *Tulips* were coming on, while very shortly the bulbs and spring plants would be removed, and *Tropæolums*, *Pelargoniums* of varied hue and many banded foliage would take their place—the edging of Thrift, or Box, *Euonymus* or dwarf *Lasander* remaining as a permanent border. Within the sheltering trees is a belt of shrubs, faced with a wide herbaceous border, rich in variety, and so contrived as to ensure something attractive at all seasons; thus, at the back were giant *Ferulas*, and then in successive order, according to height, *Tritoma*, *Rockets*, *Irises*, *Golden Euonymus*, *Poet's Narcissus*, white *Marguerites*, *Wallflowers*, *Asters*, white *Pinks*, *Tulips*, white *Arabis*, *Myosotis*, *Silene pendula*, &c. From this admixture it will be seen that there can be scarcely a day in the year without flowers of some sort. When one is not in bloom another is, the garden being sheltered, and the climate, despite its being on the east coast, decidedly mild, for are not standard *Fig* trees to be seen in the gardens as if they were at Worthing? and do not Felixstowe *Figs* carry the day before them at the autumn shows in the neighbourhood? Besides this dressed garden, Mr. Quilter has another, in which a central rockery affords a home for all sorts of interesting plants, while the well-cropped, well-tilled kitchen gardens attest the presence of a master in the art.

A few minutes' walk, and the fine residence of Mr. Cobbold is reached. Almost in the sea there is a garden in course of formation, and all the more interesting on that account. Shelter from wind is the great desideratum; this provided, the sea air brings a colour to the petal that is a wonder to those familiar with tamer hues inland. The deep violet of the *Stocks* made one realise how the old Greeks saw the face of their purple heavens reflected in these flowers. One charming part of the garden will consist of a circle or half-circle of rockwork sur-

rounding a grass-plot, with a bed of *Roses*, and *Carnations* in the centre. The rockwork faces to landward, so that the plants are sheltered from the fierce blasts, and nestling under the rocks will blossom into beauty.

A semi-circular range of houses is in course of erection, and in front is a tennis-lawn, with a fountain in the centre, and *Rose beds* and low rockeries here and there. This bids fair to be very beautiful when “that dreadful wireworm” shall have ceased to revel in the unwonted feast produced by the breaking up of the ground.

Close behind the sea wall is another rockery of *Pulham's* construction, with a trickling stream edged by *Bamboos* and *Ferns*, and destined to be the home of numerous plants suitable to the spot. *Evergreen Oaks* and *Tamarisks* attain large sizes here; while nothing can exceed the depth of colour of the *Irises*, *Wallflowers*, and *Stocks*. There may be a pretty fierce struggle for existence—there must be on the sloping bank facing the sea—but the victors at any rate celebrate their triumph with colours before which the banners and flags of a popular festival look dull and muddy indeed in comparison. To conclude, Felixstowe is not the dreary place it looks, and the Bath Hotel is the very place for those who like quiet and comfort with something to interest and attract, and a pretty garden to rest in.

### LISIANTHUS RUSSELLIANUS.

For greenhouse decoration this plant (fig. 28) is most useful, and considering the beauty of its violet coloured flowers, and the length of time they remain in perfection it deserves more general attention than it receives from those who have to keep up a display of flowering pot plants throughout the year. The plant, when well grown, always excites attention and admiration, but still it is far from being new, as it was introduced into this country in 1835 from Mexico, and it is, therefore, a matter of wonder that it is not more common in cultivation. Many say that it is rather a difficult plant to succeed with, but ordinary attention ensures good results. In an article before me it is stated that the above plant is “capable of acquiring a circumference of 7 or 8 feet and a height of 3 feet above the rim of the pot, and of simultaneously exhibiting upwards of 400 flowers either in actual expansion or in different stages of bud.” Of course specimens of such dimensions could only be acquired by stopping the plants, but our plan is to let them grow up without pinching them, and by so doing gain useful sized plants with good heads of flowers.

Seeds should be sown in February in heat, and as they are small should not be covered, placing a piece of glass on the pot shaded with paper until the seedlings are somewhat advanced. Finely broken crocks or charcoal should be mixed with the soil, as they are apt to damp off should the water not be able to pass away freely. As soon as the water is ready to handle they should be pricked off into pans or small pots, employing a porous compost of loam, leaf-soil, sand, with some broken crocks and charcoal, still keeping them in a warm house near the glass in a shady quarter. When established they should be removed to a pit, or like structure, with an intermediate temperature, keeping them as near the glass as possible; shift them on as soon as they require it, and during the brightest and warmest months they can be removed into a cool frame, which will give them strength to stand over the winter, and prevent them becoming spindly and drawn. In January or February they should be shifted on into 48-pots, using good strong yellow loam mixed with some good sharp sand and broken crock. During the winter months they must be placed in warmer quarters than a cold frame—a minimum temperature of 50° is suitable. The strongest plants as time and growth proceeds may be potted in 24s, while the smaller ones of the batch will be satisfied with smaller pots. A close, stuffy atmosphere should at all times be avoided. When the flowers show signs of expanding, the pots may be removed to a cooler structure, where they will last for a long time in perfection.

*L. glaucophyllus* is another species now in flower, the flowers of which are much smaller than the

FIG. 28.—*LISIANTHUS RUSSELLIANUS*: GREENHOUSE PERENNIAL: FLOWERS PURPLE. (SER P. 239.)

above, and do not expand fully; the growth is long and straggling, and it is far from being a desirable pot plant.

*L. princeps*.—This, according to descriptions, is the cream of the genus, which numbers something like a hundred species, but only a small number are in cultivation. *W. Harrow, Botanic Garden, Cambridge.*

## FORESTRY.

**FENCES.**—Fences of every kind, gates, and stiles, should now be made perfectly secure against the inroads of cattle, particularly such as border plantations, as when tortured by flies, farm stock naturally seek the most shady recess for comfort and repose. Hedging can now be carried on with freedom, oper-

ating on the Privet, Yew, and Box first, afterwards on the Holly, Thorn, Hornbeam, and Beech.

With the recent unusually wet weather, water-courses of all kinds will require an occasional look to, and all accumulations of twigs, leaves, and grass, collected and removed from their channel; the mouths of closed drains must likewise receive constant attention, and this is work well done, for the expense of opening and dislodging obstructions from these is frequently an item of no mean importance.

Gratings alongside roads and bye-paths should have all accumulations of *débris* removed therefrom after each spate, else the roads become flooded, and sand and dirt get washed thereon.

As soon as the corn and hay crops are removed from the fields, hedgerow trees may, where necessary, be pruned, or taken away altogether. A fair quantity of hedgerow timber is highly beneficial to lands under culture, but a superfluity is an evil with

which, unfortunately, the British farmer is too well acquainted. In removing hedgerow trees, grubbing out is far preferable to cutting over the stem at ground level, and this not only for the extra gain of land, but on account of the damage inflicted by stumps in the ground to the various farming implements. *A. D. Webster, Holwood Park, Kent.*

## PLANTS AND THEIR CULTURE.

**BEGONIAS.**—For winter flowering many of the shrubby species are very useful, being graceful in appearance, with flowers varying from red, rose, or pink, to pure white—rarely yellow, as in *B. prismatocarpa*, a small African species, which only grows to a few inches in height, but which, thickly planted

in shallow pans or pots filled with a rich gritty compost, and kept close up to the glass in a moderate stove temperature, makes chaste little cushion-like masses somewhat of the habit of *Nertera depressa*. For general purposes larger growing species are required, and of the many species now introduced we have found the following selection the most useful:—*B. ascotensis*, *B. insignis*, and the variety *knowlesiana*, all free-growing, and of branching habit, with pale red, pendant flowers, produced towards the ends of the branches. In favourable localities these sorts are frequently planted outside in summer and lifted about this time—or before there is the least danger from frost—and potted on for winter-flowering, when if kept in a rather close house until established, strong plants are obtained at a small expenditure of labour. *B. digswelliana* and *B. Sandersoni* are similar to the preceding, but dwarfier and neater, usually growing from 1 to 1½ feet high. The plants of the first named group are usually about 1 foot taller. These and succession plants of the others should now be placed in 5–6-inch flowering-pots. If the stock for the coming season is deficient, it may still be increased with a fair chance of success, but at this late period of the season large pieces should be selected for cuttings inserting several of them in 60's, and kept in a close growing temperature until rooted, which will be in two or three weeks. Gradually give more air, and pot on without singling out the cuttings; these will make a capital succession. *B. odorata* has cymes of fragrant white flowers, and *B. nitida*, a similar plant, has pinkish-white flowers. Both are well known species, but unless the plants are old they are rather too straggling in habit for pot culture; however, they do admirably when planted out against a wall or pillar where they can obtain support. Of similar habit but dwarfier is the crimson-flowered species, *Lynchiana*. *B. manicata* and *B. Berkeleyi*, which have short, thick, fleshy stems, and large oblique leaves, are both good spring flowering sorts, and quite distinct from any of the preceding. *Manicata*, with its long-stalked cymes of pinkish-white flowers, is useful for cutting purposes. *B. Berkeleyi* has rose-coloured flowers which are larger than the former. *B. semperflorens* is a dwarf white-flowered species, which, by sowing seeds at various times, may be had in flower nearly the whole year. There are also several of the ornamental foliaged sorts which flower during winter and early spring, such as *B. erecta multiflora*, with its salmon-coloured flowers and reddish bronzed foliage—a telling subject in a young state. *B. goeensis*, with its almost round petate leaves, of a lustrous green on the upper, and claret-red on the under-side, and flowering similarly to *manicata*. *B. petata* has leaves which are covered with a dense silvery furfuraceous matter. It should be rested during the summer. There is only one species of *Begonia* of a deciduous and tuberous nature, *B. socotrana*, which is naturally a winter-flowering plant, and when well done stands unrivalled. It is of dwarf habit, and produces many-flowered cymes of rose-coloured flowers, which are thrown well up above the leaves. *F. Ross, Pendell Court.*

## THE FLOWER GARDEN.

**CHRYSANTHEMUMS.**—Plants growing in open borders, as well as those against walls, have now arrived at that stage of their growth when one of two questions must be decided upon, viz., whether quality or quantity of bloom is desired, for it is useless to expect both on the same plant, and one must be sacrificed to the other whichever it may be. The majority of late-flowering varieties are now showing what in *Chrysanthemum parlance* is called the "crown" bud, and this is the one which must be secured if large flowers of good quality are wanted. Each bud will be found to be surrounded by three or four leaf or growth shoots; these must be taken out with a pointed stick or penknife as soon as practicable, and also all lateral shoots that may be pushing forth from the axils of the leaves on the main stems. If quantities of flowers is the object the young shoots must be allowed to take their own course till they form the "terminal" bud, which will show itself in about a month hence. Plants intended for lifting at a later period, and for flowering under glass, had better be cut round with a spade, about a foot from the stools, towards the middle of the month; they will thereby be in better condition for potting when the proper time arrives, and will possess more leaves when in flower than they would under the reverse treatment.

Keep the shoots well tied in, and after the flower-buds are formed water occasionally with liquid manure or soot-water, but be careful not to use the last named of too great strength or injurious results will follow. Should mildew have made its appearance adopt remedial means without further delay; keep also a sharp look-out for earwigs.

**Roses.**—Cuttings that were put into pots and placed in warm frames in July are well-rooted by this time where they have been properly attended to, and if they have not already been potted off into 3-inch pots no time should be lost in doing so. Use for this purpose three parts turfy loam, one of leaf-mould with a little manure from an old hotbed and silver-sand added thereto, returning them to the frames in which they have been rooted for the present, and keep them shaded from bright sunshine for a few days afterwards. Pay close attention to Banksian and other free-growing Roses against walls, keeping them tied-in as fast as growth is made, and adopting remedies to check the spread of mildew on all Tea-scented varieties.

**Pinks.**—Rooted cuttings ought now to be planted out in their permanent quarters, assuming they have been properly hardened off; and if the soil is poor, dig in a little rotten manure, and a dressing of leaf-mould or sifted cinder-ashes, where it is of a clayey nature. If in 4 feet beds, plant three rows, allowing a space of from 12 to 15 inches each way. *J. Horsfield, Heytesbury.*

## THE HARDY FRUIT GARDEN.

**GATHERING FRUIT.**—Peaches and Nectarines should be looked over on alternate days, and fruits of the first-named should be gathered before they become too ripe, and be placed on an airy shelf in the fruit-room, from whence they can be sent up for dessert when sufficiently ripe. Apricots, when fully ripe, always form an acceptable dish for dessert, but in a dull sunless season like the present one it will be a difficult matter to obtain them of the proper degree of ripeness at the base; and should the weather continue ungenial there will be a danger of their becoming mealy and juiceless by reason of their hanging so long on the tree. When Apricots are used for bottling the fact of the fruit being unripe at the base is an advantage, as they are not then so liable to fall to pieces. To keep up a supply for present use for dessert a few of the ripest and finest fruits may be gathered every two or three days, according to the demand, and put into a box with a close-fitting lid, and be placed in a dry warm room, when they will soon become thoroughly ripened. The same treatment applies to the ripening of Pears, provided they are in a sufficiently advanced state when gathered. The Summer Beurré d'Arenberg Pear (Rivers) is a perfect sweetmeat when ripened in this way. Some varieties of Apples will also ripen in the same way, but I find they are generally then a little deficient in flavour. After a sufficient quantity of Morello Cherries have been gathered for bottling the remainder should be reserved for culinary use and dessert, the finest being reserved for the latter purpose; and which should be allowed to hang until they are quite black, when they are very much appreciated by some persons. A few of Lord Suffield Apples may now be gathered for the kitchen, the largest and ripest being taken each time. Young Apple trees bearing full crops of fruit will require a little support to be given to the branches to prevent the possibility of their being broken off during high winds. As soon as Currants and Gooseberry bushes are stripped of their fruit the nets should be taken off, dried, and stored away. Gooseberries are not keeping well this season, the abundance of moisture causing the berries to burst. The Pitmaston Green Gage is one which is keeping the best with us, and it is also the highest flavoured; the red varieties are very acid, and not up to the mark. *A. Ward, Stoke Edith Gardens, Hereford.*

## FRUITS UNDER GLASS.

**MELONS.**—These plants will now require careful treatment as regards watering at the root and moisture in the air, and should the soil be in a satisfactory state of moistness, it will be found to be safer to give a mulch of spent Mushroom-bed manure than to afford water. Syringe the plants only on fine days, and

merely sprinkle the paths and walls in the pits when the weather is dull. A superabundance of water is the prime cause of disease at the collar. Plants which are required to fruit in November should now be in a forward state, as but little progress will be made as the days shorten. Do not over-fruit any Melon plants now; three to four fruits on a plant will be ample.

**Melons in hotbeds** will now require the linings to be frequently renewed, so that the requisite temperature be maintained. These will require still less water than plants growing over a hot-air chamber, as the roots will probably have penetrated into the moist hotted material. The fruits should be raised on posts so as to afford them the full benefit of sunlight, and turned round frequently to secure equal swelling. Cover the sashes with mats or other warm material at night, which should be removed the first thing in the morning.

**Cucumbers.**—Seeds of plants to afford fruit in the winter, if not already sown, should at once be put in. Later successions may be sown up to the first week of September. As these successions will have to keep up a supply of Cucumbers for a long period the drainage should be made perfect, and to this end it will be as well to minutely inspect the beds, and if any imperfections exist to have them rectified at once. Do not make the bed of a large body of soil to begin with, but put in small mounds, consisting of loam, leaf-mould, and spent Mushroom-bed manure; place the seeds in the heaps at the first, and they will start away with more vigour than they would in small pots. From time to time as the roots appear at the outside dust the roots with Thomson's manure, and place an inch or two of the warmed compost over them.

**Strawberries** which were in a condition to be potted in July will now have well filled their pots with roots, and a little weak manure-water may be given them twice a week. Do not crowd the plants together, but let them stand so far apart that the foliage does not touch that of the other. Keep the pots clear of weeds, and pick off all runners as they appear. Look after duplicate crowns, and reduce to one. Should the weather be wet some means must be taken to elevate the pots. In order to get the crowns fully developed stand the pots on inverted flower-pots, boards, or trellises. *Wm. M. Baillie.*

## THE KITCHEN GARDEN.

**MUSHROOMS.**—Manure for the beds should now be collected as fast as possible, and spread out about 12 inches thick in an open shed until enough is got to form a bed; in the meantime it will require turning over once in two days, to prevent over-heating, and to get rid of moisture. It is by no means necessary to shake all the straw away—the longest only should be taken out. Many failures occur in growing Mushrooms through throwing the dung into large heaps and thus getting it too hot. By doing this, much of the ammonia is got rid of before the beds are made, and there is then none left to afford support to the Mushrooms. Care should also be taken that no manure is collected from stables where green food or medicine is being given to the animals. If a good supply of manure is obtainable it is well to mix some perfectly dry loam amongst it as soon as collected, which helps to absorb some portion of the ammonia, and prevents overheating.

While the manure is under preparation the Mushroom-house or cellar should have a thorough cleaning and be well aired, and any repairs, &c., done that are necessary. These structures are best when built of hard materials in the form of a cellar under the garden sheds or elsewhere, but they are often built wholly above-ground. In such cases I have sometimes found it a great improvement to put spars across inside, so as to form an inner roof, the space between this and the outer roof being filled with straw; this prevents the undue drying of the beds when fire-heat is used.

Enough manure having been collected for the bed and well turned until thoroughly mixed and sweetened, it should be rammed into the beds as firmly as possible, and a thermometer inserted therein to ascertain when the greatest heat has been attained; and when it declines to 85° the spawn should be inserted just under the surface, in pieces about the size of a hen's egg, at 9 inches apart; all should then be made perfectly firm again, and about 1½ inch in thickness of good moist loam should be spread over the top and beaten down. *W. H. Divers, Kilton Hall, Stamford.*

*Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.*

**NOTICE to SUBSCRIBERS and OTHERS.**  
Post-office Orders and Postal Orders should be made payable at the Post Office,  
No. 42, DRURY LANE.

## APPOINTMENTS FOR THE ENSUING WEEK.

### SHOWS.

TUESDAY,	SEPT. 4	{ Horticultural Exhibition at Rugby in connection with the Warwickshire Agricultural Society (two days).
WEDNESDAY,	SEPT. 5	{ Royal Caledonian at Edinburgh (two days). Bath (two days). Ancient Society of York Florists.
FRIDAY,	SEPT. 7	{ Fruit Show and Conference and National Dahlia Exhibition at the Crystal Palace (two days).

### SALES.

MONDAY,	SEPT. 3	{ Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	SEPT. 4	{ Imported Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs, at Small's Rooms.
WEDNESDAY,	SEPT. 5	{ Dutch Bulbs, at Stevens' Rooms.
THURSDAY,	SEPT. 6	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs, at Small's Rooms.
FRIDAY,	SEPT. 7	{ Imported Orchids, at Protheroe & Morris' Rooms. Leasehold of Royal Nurseries, Ascot, at The Mart, London, by Messrs. Protheroe & Morris.
SATURDAY,	SEPT. 8	{ Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs, at Small's Rooms.

Bedding-out. SOME quarter of a century ago the bedding-out fever was at its height. Brightness of colour and violent contrasts were everywhere seen. It seemed as if there could not be too much of it to please the public. Long ribbon borders trailed their glaring lengths from lodge-gate to entrance-door. Everywhere there was fiery glare without shade, without half-tints—everything seemed to the fore—and what there was in the middle distance or background could not be even guessed. Space and repose, such essential features in good gardening, were almost entirely ignored. Of course the florists met the popular demand. "Scarlet" and yellows were produced in endless profusion. As for the gardener, his pits, his frames, his shelves, his houses were crowded to excess with bedding stuff, and much of his time and resources were taken up by providing for a short display. The beauty, the interest of a garden, were sacrificed to the mania for colour. But at length the rage culminated; even those who advocated bedding-out began to see that the thing was overdone.

Spring gardening as practised by Mr. INGRAM at Belvoir, by the late Mr. FLEMING at Cliveden, and by others elsewhere, led the public to see that much more chaste effects could be produced by subdued hues, cleverly harmonised, than by any pretentious display of ardent colour. Then, again, those who loved their garden for the sake of the plants that were in it, began, and not without grave cause, to complain that this "glare of the garden" had banished all interest from gardening. There may be some persons who prefer the senseless stare of a hairdresser's dummy, or the meaningless grin of a waxwork figure, to the charm of a countenance which tells of difficulties successfully surmounted, of troubles

perchance endured, but radiant withal of intelligence and appreciation. Just as a man's temperament and history may often be read in his face, so may the history of a plant be divined by the appreciative observer; and the interest this adds to the pursuit of gardening is incalculable. But much or most of this was crushed out by the terrible chromatomania of the time we are speaking of. Spring gardening did something, as we have said, to reduce the infatuation; the renewed introduction of herbaceous plants in decorative gardening did more; and for this we have especially to thank Mr. ROBINSON. At any rate, save over public-house doors and windows, we rarely see the chromatic horrors that were once so prevalent. The fear now-a-days is, that the pendulum may swing too far in the other direction, and that sad and muddy colours, and washed-out tints, which the complaisant florists are already providing to meet, as they say, the requirements of the ladies, may occupy places where a reasonable amount of bright colour would be appropriate and desirable.

On terrace gardens, and in formal gardens, in juxtaposition with architecture, the introduction of herbaceous plants is generally quite out of place. Their varying habits, their unequal heights, the short duration of their flowers give them in such situations a weedy, uncared-for look, and a style of ornamentation that should be symmetrical and graceful becomes thus represented by a meaningless muddle. The truth seems to be, that in particular situations herbaceous plants can never take the place of bedding plants, used with judgment, and the converse is also equally true. Carpet-bedding with *Alternantheras*, *Gibraltar Mint*, *Sedums*, and such-like, still enjoys much popular favour, and when well carried out and judiciously situated, it cannot be denied the merit of prettiness. Moreover, it appeals to the popular taste, which sees in it difficulties overcome, and is always ready to applaud ingenuity, however perversely applied. Gardeners worthy of the name, however, are not likely to feel much interest in this sort of work, which could be as well done with bits of coloured glass or stone as with leaves. The dotting system is better, and some good illustrations may be seen at Kew. Out of many, one may be mentioned as very effective. The groundwork is the *Riccarton Fuchsia*, now in full bloom, dotted among which uprise spikes of *Hyacinthus candicans*. Were the bed less formal in outline, its appearance would be improved.

The mention of Kew leads us to note with pleasure the recent formation of shrubbery beds filled with select varieties of *Berberis*, *Euonymus*, *Ceanothus*, *Hydrangea*, and other ornamental shrubs, evergreen, variegated, or flowering. This notion of picking out the best and most suitable varieties and showing them in the mass, is an excellent one, and the gardener who has—as so many have in these days—to produce an effect at the lowest cost and at the least expenditure for maintenance, may learn many useful lessons from the Royal Gardens. In addition to the mixed beds are isolated masses of *Japan Anemones*, *Helianthus*, *Delphiniums*, *Carnations*, and other perennials, the only objection to which is the formal outline of the beds, though when in immediate proximity to the straight lines of the building this may be a necessity.

Of the large rock-garden at Kew we need hardly speak in this connection. It has been a great success, and is a delight at all seasons. The principle might be extended, and much of the monotony of modern flower gardening avoided by

the construction of small rock borders near the edges of the lawns, or anywhere where they would not interfere with the view of that most delightful feature of English gardens. Low rockwork of this character, filled with appropriately selected plants, seem to offer a judicious compromise between the utter barbarism of bedding-out as it is used to be and the unsuitability for the particular purpose and locality of herbaceous plants generally.

Combined with a rock garden there might be a portion of the garden around the mansion set apart for beds of foliage plants of a hardy as well as tender character, interspersed with beds of flowering plants among which the now too obtrusive *Pelargonium* and *Calceolaria* might find place, as patches of desirable enlivening colour. Amongst the foliage plants suitable for the purpose may be mentioned the *Aralias Sieboldii*, *spinosa*, and *papyrifera*, *Japan Maples*, *Dracena australis*, *D. brasiliensis*, *Costus imperialis*, the *Chusan Palm*, stately *Yuccas*, *Tritomas* which combine beauty of flower with slightly foliage.

With the experience of the present year before us, the too free use of tender exotics of either section should be avoided, and preference given to things of known hardiness. The late flowering *Teas* and *Noisette Roses* might be made much more use of, as well as the monthly *Rose*, and that fine dark *Rose*, *Cramoisie superieure*.

**THE LOCAL GOVERNMENT BILL.**—This very complicated and unwieldy measure stood in need of what Mr. CHAMBERS has now supplied, viz., a classified abstract. Many of our readers, members of the Court of Quarter Sessions and others will be interested in ascertaining precisely what is to happen to them, what is to be the mode of election of the new County Councillors, and what their duties. All this is told in *A Popular Summary of the Law relating to Local Government*, by Mr. G. F. CHAMBERS, and published by STEVENS & SONS, 119, Chancery Lane, E.C. Most country gentlemen will be glad of this book for reference.

**CONFERENCE OF FRUIT GROWERS AT THE CRYSTAL PALACE.**—A meeting of the Executive Committee of the above Conference was held in Auderton's Hotel, Fleet Street, on Tuesday last, August 28, T. FRANCIS RIVERS, Esq., in the chair. The principal business was the consideration of a number of communications received by the Hon. Secretaries, Messrs. LEWIS CASTLE and WM. EARLEY, offering papers and suggestions, and the determination of the programme for the Conference. The committee now comprises about seventy of the leading fruit growers, nurserymen, and amateurs throughout the kingdom, all of whom had expressed their hearty approval of the scheme, and their desire to assist in rendering the meeting both useful and interesting. After considerable discussion it was decided that the subjects should be taken in the following order, each paper to occupy about twenty minutes in reading to allow ample time for discussion. The Conference will be held in the Crystal Palace (the place will be notified on the morning of each day) on September 7 at 3 P.M., and September 8 at 2 P.M. On September 7 the first subject will be "Fruit Culture for Profit," by FRANCIS T. RIVERS, Esq., to be followed by Mr. COLEMAN, Eastnor Castle Gardens, and others. The second subject will be "The Packing, Carriage, and Marketing of Fruits," by Mr. WEBBER, of Covent Garden; and Mr. SAMUEL RAWSON, of Birmingham. On September 8 Mr. TALLERMAN will deal with "Fruit Distribution," Mr. MANNING with "Fruit as Food," and Mr. ALBERT BATH with "Land Tenure in Relation to Fruit Cultivation." All who intend taking part in the discussion will facilitate the arrangements if they send in their names to the Hon. Secs., Mr. LEWIS CASTLE, Hotham House, Merton; Mr. WM. EARLEY, Ilford; or to the Chairman on the day of the meeting.

**FRUIT GROWING.**—A conference on fruits suitable for market purposes will be held at the Corn Exchange, St. Albans, on September 4, chair to be taken at 7.30 p.m., by the ex-Mayor of St. Albans, H. P. SMITH, Esq., J.P. The following gentlemen and horticulturists will contribute papers:—Mr. T. MORGAN (author of *How to Make the Most of the Land*); Mr. S. T. WRIGHT, Glewston Court; Mr. T. HODDAY; Mr. J. CHEAL, of Crawley, Sussex; and Mr. W. F. EMBAYGE, of St. Albans. Admission will be free.

**THE PINE-LIKE FRUIT OF THE ASSYRIAN MONUMENTS.**—Those who have seen the Nineveh marbles in the British Museum must have noticed the cone-shaped fruit covered with knobs which are to be seen in the hands of some of the figures who are apparently making offerings to the king. The figure might pass for a conventional representation of the Stone Pine, *Pinus pinea*. Dr. BONATIA, in recent numbers of the *Babylonian and Oriental Record*, offers some ingenious arguments in support of the hypothesis that the fruit in question is a Citron. The Orientals still attach great value to the powerful fragrance of these fruits.

**ORIGIN OF BOTANIC GARDENS.**—In France, in the 16th century, the fashion was all "in favour of brocades and brocatelles, stuffs of flowery patterns, the designs for which gave birth to the use of Pomegranates and other fruits with fine foliage. The designers sought inspiration from plants blooming in luxuriant fullness. An intelligent horticulturist (JEAN ROBIN) set himself to meet the demand in this respect by opening a garden with conservatories, in which he cultivated strange varieties of plants then but little known in our latitudes. This proved an immense success. In a short time the king (HENRY IV.) purchased JEAN ROBIN'S horticultural establishment, which, under the name of Jardin du Roi, became crown property. The learned GUY DE LA BROUSSE in 1626 pronounced the suggestion that medical students might study the plants without interference with the designers for embroideries and tapestries; whence the first Jardin des Plantes (botanical garden), with its natural history museum, came into being. This institution seemed so excellent that every country adopted it as an example, and founded similar ones. Who would have thought it possible for embroidery thus to have come to the aid of science? We copy this extract from Mr. ALAN COLE'S translation of M. LEBEYRE'S *Embroidery and Lace*. The Jardin des Plantes, however, was founded by LOUIS XIII. in 1610, and finished in 1634, and it would seem that the embroiderers availed themselves, as they ought to, of the resources of science, rather than aided it themselves.

**HYBRID CONIFERS.**—Dr. RICHARD WETTSTEIN, in the *Proceedings of the Imperial Academy of Science of Vienna*, has published the results of his observations on the leaf-structure of various reputed hybrids, such as *Pinus rhætica* ×, a hybrid between *P. montana* and *P. silvestris*; *P. Neilreichiana* ×, between *P. nigricans* and *silvestris*; and also various Junipers. The anatomical characters of the foliage of the hybrids in every case are intermediate between those of the reputed parents, and hence lend confirmation to the opinion that the forms examined are really of hybrid origin.

**FOREST MANAGEMENT IN GERMANY.**—We hear much of the excellent system of management in German forests, and the value of the forests and forest schools as training institutes for those destined to enter the forest service of India. Some notes on the subject, therefore, from the pen of Sir DIERCKH BRANDIS, the late Inspector-General of Forests of the Government of India, will be welcomed by all interested in forest matters. Sir DIERCKH shows that modern forestry, so far from being unduly a matter of routine, treats each portion of a forest with special regard to the peculiar conditions of the locality and the requirements of the growing stock, while due attention is constantly paid to the

systematic arrangements on the entire forest range. While the system is thus elastic on the one side, due care is taken to prevent it becoming confused on the other. British foresters may, it is pointed out, be startled at the mass of what they may consider needless minutiae and superfluous figures, but these details constitute the essence of methodical forestry. "The forester's success is based upon close observation of numberless minute details in the development of the trees and shrubs of which his forests are composed. The observations and measurements made by him, combined with the results obtained by the researches of others, enable him to understand the complex problems which every forest presents, and to shape his treatment in the right manner. The fundamental principles underlying the forester's profession are simple enough, but their application is difficult. This must be learnt by study and by actual experience, as in every other profession." The work before us is entitled *Notes*, and its author expressly says that it is not to be considered as a complete treatise, but is simply meant to draw attention to a few essential points which may be useful to Indian foresters. We have, in fact, an account of the forests in the Grand Duchy of Baden, including the Black Forest together with notes of forests in other portions of Germany. Of special interest are the notes on the rotation of forest and cereal crops in some districts, where the coppice belongs to certain public corporations exercising a common proprietorship over a definite tract of ground cultivating the domain on a common system and sustaining itself by the produce. The coppice is cut after seventeen to nineteen years, the bark peeled, the sods burned, the ashes spread over the cleared land, and a crop of Rye sown. The shareholders have the right to grow this Rye crop for their individual benefit, but having gathered in this crop the plot relapses into the state of undivided or common property when the coppice is allowed to grow up again. The appendices contain tables for the conversion of the methodical metrical system to the stupid and confused system still in use in this country, and an explanation of the more important German technical terms.

**THE "FRUIT" OF GRASSES.**—In the fruit or "grain" of grasses, according to the commonly received notion, the wall of the ovary (pericarp) becomes inseparably united with the testa of the contained seed. M. HENRI JUMELLE, however, in a recent communication to the Académie des Sciences, maintains that no such fusion ever takes place, but that what happens is the partial obliteration of the pericarp and the complete disappearance of the seed-coat. The fruit of grasses is thus botanically an achene, containing a seed destitute of testa.

**HONG KONG.**—The superintendent of the Botanic Gardens complains of the loss of shrubs and trees of great beauty and of twenty years' growth, in order to provide a site for a statue. We can of course offer no opinion on this special case, but we heartily endorse Mr. FORD'S opinion, that the Superintendent of the garden should be consulted in all such cases, and his judgment preferred to lay opinion. Mr. FORD has made an excursion into the province of Kwang Tung, bringing back with him no fewer than 800 living plants, chiefly of an ornamental character, so that we may hope in due season to see some of these novelties. Mr. FORD incidentally mentions that the timber of *Cunninghamia sinensis* is much more valuable than that of *Pinus sinensis*.

**BULBS FOR THE ROYAL PARKS.**—We are informed that the whole of the bulbs required by the First Commissioner of Works, and also the Metropolitan Board of Works, for planting in the royal parks, are being supplied by Messrs. JAMES CARTER & Co., the QUEEN'S seedsmen.

**SHROPSHIRE FLORAL AND HORTICULTURAL SOCIETY.**—Regarding the exhibition of this prosperous Society at Shrewsbury, of which a report was

given in our last issue, it may be noted that it was a complete success, 14,200 people visiting the show on the second day, the receipts from all sources reaching the respectable figure of £2700. An excellent display of Begonias of the tuberous section, both double and single-flowered, was made by Messrs. J. LAING & Sons, of Forest Hill, S.E., at the above show. These plants would demonstrate to the Salopians the floriferousness of a species of Begonias which has afforded so much satisfaction when bedded out this dripping summer, whereas the zonal *Pelargoniums* have been almost flowerless. Hollyhock blooms of good quality, and plants of *Saxifraga sarmentosa* tricolor *superba* were likewise shown by Messrs. LAING.

**DEVIZES CASTLE.**—We are informed that the purchaser of this picturesque and valuable property is Sir CHARLES HENRY S. RICH, Bart., of Shirley House, Hampshire. It is a very compact property; the fruit and kitchen gardens are situated on the sunny slopes of the castle mound, and the arrangements are very convenient, the houses being in good repair, and water laid on at all points. Under the management of Mr. THOMAS KING, who has now had charge of the gardens for a large number of years, they are in a high state of efficiency. Whether Mr. KING will remain in charge under the new owner is not yet settled.

**TESTIMONIAL TO MR. JAMES HUNTLEY.**—This gentleman, who has been actively connected with the Trowbridge Horticultural Society since its establishment thirty-six years ago, has this season also completed a term of twenty-five years' service as the Secretary of the Society. It is not too much to say that it is mainly owing to Mr. HUNTLEY'S exertions, not only that the Society holds so successful a show each year, but that it also has a reserve fund of £245. In recognition of Mr. HUNTLEY'S services during this long time, a committee has been formed which is engaged in raising a fund to present Mr. HUNTLEY with a suitable testimonial during the autumn. As the idea is being warmly taken up by the Trowbridge people, it is expected that a handsome sum will be realised. The honorary secretaries to the fund are Mr. T. S. HILL and J. HOWARD FOLEY, both of Trowbridge.

**FLOWER SHOW AT BURNLEY.**—The twelfth annual exhibition of plants, flowers, fruit, and vegetables, under the auspices of the Burnley Floral and Horticultural Society, was held at Turf Moor on Saturday, the 25th ult., under the patronage of Sir JOHN THURSBY. The day was fine, and there was a large attendance of visitors. The past season has not been very favourable for the cultivation of fruit or flowers, and this was shown particularly in the classes reserved to professional gardeners. In some of the open classes there was little or no competition owing to the small number of entries. Fuchsias were a good class, and the Picotees and Carnations were above the average, whilst fruit, generally speaking, was a good show considering the season. The principal prize-winner was Sir JOHN THURSBY'S gardener.

**ARBOR DAY.**—The following note, under the above heading, occurs in a recent report on the agriculture of Chicago for the year 1887. After referring to the arid regions of Dakota, Nebraska, and Kansas, the report says:—"In the above-mentioned districts there is an almost total absence of trees, which accounts for the deficiency of moisture, while in the timber regions and in the mountains the reckless cutting, especially of young trees, has led to a serious decrease in timber and firewood. Various Acts have been passed checking and restraining the unlimited waste which formerly prevailed, and the disposal of land under the Timber Culture Law will, no doubt, have a beneficial effect. It was in the State of Nebraska, fifteen years ago, that a voluntary movement first originated to set apart one day in the year, called 'Arbor Day,' for the purpose of

encouraging the planting of trees, and forestry in general. The example has been followed in almost every State and Territory in this district, and a public holiday is proclaimed by the Legislature, the day being fixed generally by the Governor, when trees are planted by local authorities and other notable persons; planting of shade trees in streets is carried on by town councils, and the people generally are encouraged to memorialise the day by similar acts. The White Elm is considered the best tree, being hardy, and of rapid growth. The different varieties of Oak, Walnut, and Maple, the Elm, Ash, Catalpa, Linden, Tulip tree, Pine, and other trees are variously recommended to the public, as experiments have proved them to thrive in the different localities, or are suitable to the purposes desired; and the holiday is very generally observed with its intended object. In Kansas there are now more than 250,000 acres of artificial forest, and a large number in Nebraska, and the observance of 'Arbor Day' promises to be of great benefit eventually to the country."

**RYDE HORTICULTURAL SHOW.**—The annual show of flowers and fruit, favoured with a fine day, took place on Thursday, August 23, in the beautiful grounds of the Terrace Gardens, which were kindly lent by Mrs. G. PACK. The show was generally pronounced to be better than any previous exhibition. The exhibits were shown in three large tents, the Mayor attending and opening the show. In the evening the beautiful grounds were lighted up by hundreds of lamps, and looked like a fairy land, and was well patronised by the public. Altogether the show was a great success, and reflects much credit upon Mr. J. ELEY, the Secretary, and those who carried it out.

**THE COLD STORAGE OF FRUIT.**—In our last issue we explained the system of evaporating ammonia by which the temperature was reduced; giving also the temperatures of the three rooms which were at 38°, 25°, and 22° Fahr., respectively. Since our last issue we learn from the *Journal of Horticulture* that the committee appointed by the Royal Horticultural Society to ascertain the practicability of preserving soft fruits under the influence of cold, met on Thursday, Aug. 23, at the Cold Storage Company's offices in Gracechurch Street, T. FRANCIS RIVERS, Esq., in the chair, and examined the Cherries referred to us at p. 215. Several half-bushel baskets of Cherries had been placed in the chambers on August 8, wet, and some of them decayed. Some were frozen like marbles, others were abnormally firm, but not actually frozen, others remaining soft. Those that were not frozen were in the same condition as when stored fifteen days previously, and those that were decayed then had not in the slightest degree communicated decay to others pressing against them. Those in the coldest freezing-chamber were spoiled. Soft fruits must evidently not be frozen, and the point to determine is the amount of cold that suffices to arrest fermentation, this settled, it is not unlikely that soft fruit can be kept for some weeks or months. Various kinds of fruit will be tried under differing conditions in the hope of acquiring information of substantial value.

**POTATO DISEASE.**—The proportions of sulphate of copper recommended by M. FRILLIEX to be used for the cure or check of the Potato disease are 6 kilogrammes (13½ lb.) of sulphate of copper, an equal quantity of lime, and 1 hectolitre (22 gallons) of water. As we have already mentioned, this application used freely, with a syringe or a spray-producer, is most serviceable in the case of the corresponding malady in the Vine, and its use under these circumstances has suggested its employment to Potatoes. We earnestly hope some of our readers will try it and let us know the results. It should be used directly a spot is seen on the leaves. It is of no use trying it when the leaves and haulm are already half rotten.

**THE WEATHER.**—Nothing but disasters to report about the weather. Details are needless, and would only be harrowing to no purpose.

## FOREIGN CORRESPONDENCE.

### HORTICULTURAL NOTES FROM BERLIN.

The floral establishments in Berlin plainly show that the height of summer is passed. Roses, with the exception of Teas, are over, but Carnations take their place. Besides these, which are not so generally in cultivation as in England, Fuchsias, Heliotropes, and Hydrangeas, are very popular. The latter, especially the blue flowering varieties, are very luxuriantly grown. *Lilium auratum* has won favour wonderfully during the last few years, but it is a pity that, for convenience sake, the anthers have to be cut off, thereby robbing the flowers of one of their greatest beauties. Large flowering Pansies find many purchasers. Zonal Pelargoniums are among the market plants for which there is the largest sale, and splendid dark blue varieties of *Lobelia erinus* rank next.

The large floral establishments daily contrive new arrangements to tempt the public, in which colours are effectively contrasted, but also with refinement. Lately I saw a cushion-shaped bouquet (a form that is very popular just now), which was composed of Pansy Faust, a pure and velvety-black variety laid against a snow-white background of white Stocks. Another arrangement was made up on a wire frame covered with dark green gauze; the framework was composed of *Viburnum Opulus*, fl.-pl., while in the middle, quite distinct from these snow-ball-like flowers, was a raised loose bouquet of *La France* Rose-buds.

The dweller in Berlin knows well how to appreciate the value of evergreen plants for indoor decoration, and an infinite variety is to be found in our flower markets. In the first rank are *Latania borbonica*, *Phoenix reclinata*; then *Dracaena indivisa*, *Aletris fragrans*, *Philodendron pertusum*, and *Aracaria excelsa*. Besides these there is the favourite *Ficus elastica*. One or more specimens of these plants is to be found in every home; and next to them as indoor plants rank *Rhipis flabelliformis*, some *Dracaenas* and *Cordylines*, and more especially certain *Cactaeae*. Of the latter, very fine specimens are to be met with often in the dwellings of the poorer classes, and which are so well grown as to be fully worthy of a First-class Certificate. Among such plants, too, are some sorts of Pelargoniums, notably the so-called "Rose" Pelargonium. *Aspidistra*, too, which are practically indestructible, are naturally seldom wanting, nor are *Dracaenas*, and the equally abundant *Curellogia recurvata*, which are classed under the general name of Palms even by the educated public. *From our Berlin Correspondent.*

### PHILADELPHIA.

On June 28 Councilman Meehan's ordinance, inaugurating a system of small parks for Philadelphia, finally became law, after a five years' struggle. Only five of the thirty-one intended to be established were adopted by this preliminary ordinance, one of these being the famous old botanic garden of John Bartram, and another being the old homestead of Logan, the first secretary of the Commonwealth of Pennsylvania under William Penn.

## TRADE NOTICES.

**DICKSONS (LIMITED).**—The formation of a limited company by the amalgamation of the two well-known firms of the Dicksons, at Chester, has already been announced in the *Gardeners' Chronicle*, and the Company now possesses one of the largest nursery and seed businesses in the United Kingdom—the total area under cultivation, including the three branch nurseries in Wales, being over 400 acres, well cropped with healthy, thriving stock.

Seedlings of trees, shrubs and evergreens are grown by millions. Transplanted forest trees, plants for underwoods, game coverts, hedges and shrubberies

may be counted by millions also. Larch Firs and Thorns represent, perhaps, the largest numbers, about three millions of each being available for sale this season; Scotch, Austrian, Corsican, Douglas, and Spruce are largely grown, and numerous fine drifts of Oaks, Ash, Elms, Beech and other hardwoods.

Choice Conifers, fine green and variegated Hollies, Laurels, Aucubas, choice Rhododendrons and other evergreens cover many acres, and the quantity of flowering and ornamental trees and shrubs appears to be without limit. Trees for avenues, street planting, or for grouping in parks are here in great numbers, fine examples from 10 to 18 feet high.

Sixty-five acres are devoted to the cultivation of fruit trees, for which these nurseries have long been noted, and in addition to young trees of the usual planting sizes, there are quantities of extra large, well-grown fruiting trees trained in pyramid and espalier forms.

That Roses thrive well in the climate and soil of Chester is demonstrated by the luxuriant growth of the large numbers cultivated.

The indoor department comprises no fewer than eighty glasshouses well filled with stove and greenhouse plants, fine Camellias, Indian Azaleas, Tea and other Roses, strong Vines, fruit trees in pots for orchard-house, Figs, &c. Numerous ranges of brick and wooden frames with lights are utilised for plant propagating purposes and growing young succession stock.

Close by these houses and pits are grown the large collections of herbaceous and alpine plants. Bulbs are extensively cultivated, especially Narcissus, one plot containing many thousands of Sir Watkin, a very fine form, originally distributed by Messrs. Dickson; while of Emperor, Empress, Horsfield, and other leading varieties there are large stocks.

Amongst Carnations, Mrs. Reynolds Hole is a striking novelty; the flowers, which are very large, and produced freely, they are of a beautiful salmon colour. This Carnation will probably be in great demand, to meet which a stock of many thousands is ready for distribution.

Before leaving the nurseries we must bear testimony to the good order in which they are kept, and to the excellent condition of the stock, which reflects the highest credit upon the management.

**The Seed Department.**—To convey an idea of the magnitude of this branch of the business, it may be mentioned that there are two sets of spacious buildings in Eastgate Street, containing commodious seed and bulb premises, with well-appointed offices over them; contiguous is a large warehouse replete with modern implements and agricultural machinery. Large farm seed stores are situate in St. John Street and St. Werburgh Street, in which is the most approved machinery, driven by gas-engines, for cleaning seeds, and upon which no expense has been spared to make them as perfect as possible. As all seeds are sold under guarantee as to purity and stated percentages of germination, the utmost care and unremitting attention of the principal partners are necessary. Farm and garden seeds are saved from their own specially selected stocks under their personal supervision, and duly tested before being sent away to purchasers. Here as in the nurseries, order and method are everywhere apparent, and as the managing directors are assisted by a most efficient staff, it is evident that every care is taken to ensure the satisfactory execution of all orders. The valuation of the entire stocks of both firms for the purpose of amalgamation was entrusted to the highly competent hands of Mr. John Fraser, of the Lea Bridge Nurseries, Leyton; and of Mr. Maurice Young, of the Nurseries, Milford, Surrey. About one month was occupied by these gentlemen in the task, which was eventually completed to the satisfaction of all parties.

— I see in your issue of the 11th ult., under "Trade Notices," that Eastgate Nursery has passed into the hands of Messrs. W. & J. Brown. This will mislead the public, as they have not purchased the trade, but only part of the freehold, and the business will be carried on as heretofore. *Mrs. House, Eastgate Nurseries, Peterborough, August 20.*

— Mr. W. Napper, late of the Exeter Nurseries, where he was employed for twenty years, has been engaged as manager by Messrs. Jarman & Co., nurserymen, florists, &c., Chard.

— Mr. D. Margetts, ornamental wireworker, and maker of exhibition bouquet and flower-stands, has removed from 16, York Street, Covent Garden, to 8, Vinegar Yard, Catherine Street, W.C.

## NURSERY NOTES.

## NOTES FROM SOUTHFIELDS NURSERY.

In looking over these grounds of Messrs. J. Veitch & Sons, Chelsea, we could not but remark the change in the age and general appearance of the trees there grown for sale, and doubtless to be observed also in most other fruit tree nurseries. Whereas, formerly, fruiting staff was difficult to obtain, and always dear, it is now found in quantity to meet the demands of the day. Men will not wait to see a tree grow from a diminutive "maiden" as was formerly done, but they must have their young trees sent to them in a bearing condition. This is the natural corollary to growing Apples and Pears on dwarfing stocks to obtain returns earlier than is the case when Crab and wilding Pear are employed for the purpose. At this nursery fruiting trees take up much of the area that in past years was under a crop of young fruitless maidens, and one or two-year "cut backs." At the time of our visit there were cordon Gooseberries, Currants, Apples, Pears, and Plums, besides bush and pyramidal formed trees of the last three in bearing condition.

Peaches were well set with bloom-buds; Cherries, of late Duke and Morello varieties, and Plums were loaded with fruits, the trees being fan-trained generally, although in the case of Plums we found horizontal-trained examples.

It may be of interest to name some of the varieties of Apples which, in this unfavourable season, are bearing plenty of fruit as bushes and pyramids, and in scanning the list it will be remarked that most of them are varieties which have become popular by reason of their good cropping or other desirable properties, viz.:—King of the Pippins, Kerry, Ribston, Sturmer, and Cox's Orange Pippins; Dumelow's Seedling, Ecklinberg, Keswick Codlin, Beauty of Kent, Alexander, Schoolmaster, Worcester Pearmain, Stirling Castle, Bauman's Red Reinette, Betty Geeson, Alfriston, Lane's Prince Albert, Boston Russet, Warner's King, Grenadier, Old Hawthornden, and Winter Hawthornden, Rosemary Russet, and Lord Suffield.

Amongst Plums in fruit may be mentioned Wilmot's Orleans, and as large as the early variety, but of better quality; the Czar is another prolific variety.

As a stock for dwarf-trained Cherries the Mahaleb has quite usurped the place of the wilding Cherry, its growth keeping better pace with that of the scion, and as it is almost free from shoots and suckers it is as smooth as a gun-barrel, and well looking.

Three fine Figs will be sent out from this nursery shortly, viz., Violette Sepor, with very dark flesh, and a delicious flavour; Pingo de Mello, a fine fruit, and the tree an excellent cropper, producing well thrice in a season; and St. John's, a white Fig of the best quality. These Figs are of Portuguese origin, the best which a connoisseur could select amongst the numerous varieties grown in that country.

## USEFUL INVENTIONS.

## HIGH-LEVEL WATERING-POT.

By means of this kind of watering-pot much loss of time, and some inconvenience are avoided in supplying plants with water when standing on overhead shelves in plant-houses and rockeries, both indoors and out. As will be seen from the figure (A, fig. 29), the pot may be tilted at any desired angle to allow the water to flow out, by means of a shaft of wood with which a jointed iron rod connected with the spout of the can runs parallel. As a watering-can is not a discriminating being, we do not understand by what means the gardener who does the watering finds out which plants want his attention and which do not, without mounting a pair of steps, and examining them. So much for its drawback when used to water subjects above man's height.

## WEED ERADICATOR.

The other implement figured (B) is a handy kind of hoe, likely to prove of great use in cultivating and stirring the soil amongst, Onions, Carrots, Lettuces, and bedding plants. Owing to its form it may be used sideways to scrape away small weeds, or with its narrower face downwards to cut off weeds and loosen the surface. Both implements are the patented inventions of Mr. G. R. King, Upton, Torquay, and may be obtained retail at all ironmongers and seedsmen.

## HOME CORRESPONDENCE.

**THE POTATO CROP.**—The southern division of Essex has suffered much from the rains of July. In that month we had 7.57 inches of rain, and doubtless to that rainfall must be ascribed the sudden appearance of the disease. When I sent you my notes, which you published at page 154, there was no disease, but suddenly, like a thief in the night, it came, in spots in the garden and in the field, and has since spread in all directions. I fear our promising crop will be almost lost. The old Ash-leaved variety on an early border was nearly ripe in the haulm when the blight came, and I find a tuber here and there diseased. Myatt's Kidney, in a later position, promised to be the best crop I ever saw—in fact, we had begun to dig them. They were all sound at first, but now, after ten days, about one

FIG. 29.—A, HIGH-LEVEL WATERING-POT. B, WEED ERADICATOR.

tuber in five only is sound. I fear, by the look of things, all our fine lot of Victorias will go. It is generally hit hard. There is a large lot of Myatts in the same field for early winter use; we shall perhaps get one bushel out of six that are sound; perhaps not. I hope Sutton's 36 will stand better; it has given up the best crop and the most handsome tubers I ever saw, but I fear nothing will withstand such an acute attack. I walked through some neighbouring fields for a few miles in the gloaming last night. It soon became too dark to distinguish one crop from another, but the sense of smell was enough for a field of Potatoes: and yet it is not all bad. I saw a field of Regents being dug to-day ten minutes walk from where I write this. It is light soil over gravel and very dry; the haulm is not yet stricken, consequently the tubers are sound. I suggested sending them off at once, but the answer was returned "We want some for winter use." Our soil is heavy, and the sudden downpour of 3.49 inches of rain in three days was too much for our drainage. The water was held back over all the crops for thirty-six hours. The rock garden was under water, there was 5 feet of it in the stokehole; it stood 1 foot over the top of the hot-water boilers. We were thirty-six hours before we could pump and bale it all out. I trust that the disease is local, as few districts can have suffered so much from back-water as we did. The low grounds in the valley of the Koden, near Romford and Ilford, were quite under water for twenty-four, and in some parts forty-eight hours. The local papers say it was all caused by the sluices at Barking Mills being closed, and that they could not be opened when the rush of uncarted cut grass from the meadows poured

down the river and was stopped at the closed sluices, *J. Douglas.*

**GRAPES IN BAD CONDITION.**—In his communication of August 25, "J. C." does not say anything about the drainage under his Vine border. The subsoil may be water-logged, or it may be too dry. Either extreme will cause "shanking," so also will red-spider, which greatly injures the foliage, and causes its premature discoloration. The Vines are planted too closely together, and both foliage and roots must suffer. It would have been better to have relied upon the old Vines throwing up fresh canes rather than to have planted young Vines between them, as they rarely do well under such circumstances. If it were my case, I should cut the Grapes as soon as possible, sponge the underside of the foliage with soapy water, syringing afterwards on fine evenings. Give plenty of top-ventilation, maintain a gentle warmth in the grape house, avoid sulphur, and encourage the formation of healthy leaves and well-ripened wood. I should keep the border both outside and in rather on the dry side during the winter, and look well to the drainage. In the spring the Vines might be allowed to start with little or no fire-heat, and no watering except with the syringe before the shoots are 3 inches long. The border side should then receive a copious supply of tepid rain-water, and the temperature of the house should be gradually raised. During the summer water should be given both outside and in whenever required. If not satisfied with the old Vines, in May or June I should root them up and plant yearling Vines prepared in readiness. They never do so well as when planted early in June in fresh warm compost. The growth they make the first season is astonishing, and Vines planted thus in a green and active state ever after show a superiority over those planted at any other time. In old houses Vines are generally trained too near the glass. The top ventilation is often insufficient, and much scalding occurs without not opening early in the morning. *W. R., Streatham Hill.*

**GENTIANA ASCLEPIADEA.**—In reply to the inquiry of "C. E. F." in the *Gardeners' Chronicle* for 25th ult., I would state that the above hardy herbaceous perennial may be propagated by seed sown as soon as it is ripe, in a mixture of sandy leaf-mould and loam, and placed in a gentle heat. The young plants should be gradually hardened off before being planted out, which may be done in the spring. The plant may also be propagated by division of the roots in the spring. *W. A. Hodge.*

**VEGETABLES.**—Although most gardeners have been lamenting the scarcity of fruit this season, they have reason to rejoice in the abundance of vegetables, as never, perhaps, was there a summer so suitable for most garden crops, and Peas and Scarlet Runners seem quite to revel in the weather. The first-named, however, have not set quite so full as they do sometimes, but they have gone up the sticks and far beyond, or are drooping down again, or striking out right and left, searching for something to lay hold of for support themselves, and nearly choking or smothering each other with haulm. In ordinary years mildew would have been rife long ere this, but as yet (August 13) no trace of it is to be seen, and we may with some confidence look for a full supply of Peas late in the autumn. Scarlet Runners are setting and swelling freely, but dwarf French Beans like a little warmer, and are lagging behind, looking a little chilly, but they can well be spared, and the wonder is that they should be grown so largely as they are, considering that the Runner kinds are so much more hardy and so superior in flavour. Broad Beans are also cool weather plants, and instead of being dried up as they usually are at this time of year, or infested with blackfly, they are fresh and full of bloom or pods; and Cauliflowers are just as fresh, close, and white as they are in spring or autumn; and all the Brassica tribe, instead of having the "blues," are rampant in growth, and look too "proud" to face a hard winter. Celery, strange to say, has not made the headway one might have expected from its being half aquatic, but it is on the move now, and no doubt will make rapid progress after this, as the roots have a good hold. Tomatoes are very backward, as they are lovers of sunshine, and the weather cannot well be too hot for them. The set is also bad, the wet and absence of solar rays having caused most of the first flowers to fall, and I doubt if those on the plants now will set in

time for the fruit to ripen before frost cuts it off in the autumn. Potatoes show patches of disease here and there, but the tops in a general way look well, and it is to be hoped, now that we are having a dry atmosphere and sun and warmth, the mould may be stayed and the tubers escape [?]. The earth is full of these at the roots of the plants, and they promise to be unusually large, and, with favourable weather, must be of fine quality, as there will be no secondary swelling like we have when the soil is so heated and dry. *J. Sheppard.*

**CABBAGES.**—Whatever may have been the products of Mr. Wilkes' trial of Sutton's Early Gem and Little Pixie in his limited way, it is certain that these kinds differ appreciably in Messrs. Sutton & Son's trial-ground, Little Gem being greener, earlier, and dwarfier and more compact. The firm also catalogue Little Pixie, and it is hardly probable they would offer the same kinds under two diverse names in the same list. That distinctions in Cabbages may be, indeed, are, almost infinitesimal there can be no doubt, because improvements and diversities of a desirable nature come slowly; but it is the expert, enterprising seedsmen, who has large breadths of many varieties under his notice year after year who has the most favourable opportunities for detecting diversities of character, selecting, and fixing them; and it is to this watchful care that we owe so largely that remarkable improvement in garden products which has marked the past twenty years; thus, possibly, Tom Thumb developed from the old Early Dwarf, Little Pixie from Tom Thumb, Little Gem from Little Pixie, &c., at least such may be so, although I have no reason for saying such is the case.—Mr. Wilkes does not say whether he purchased his seed from the Messrs. Sutton & Sons direct. With respect to my visit to the Reading trial-grounds, it may be as well to say that grounds of that kind are kept by seedsmen specially for their own use and experience, and not for that of the general public. There is, however, an immense deal of information to be gathered in them, and I wished a market gardening neighbour who was with me at Reading recently to have an opportunity to see what good things in the way of vegetables might be found in a place which is bolted against him and his class as a rule. The fact that so good an expert in market growing was specially warm on Little Gem and the other things noted, led me to make mention of them in these pages. *A. D.*

**ALEXANDER AND HALE'S EARLY PEACHES.**—In reply to Mr. Shepherd's inquiry on your issue of last week concerning the above, I can confidently assure him that they are quite distinct. We have them both growing in our early Peach-house, and I had finished gathering Alexander fully a fortnight before Hale's was at all fit. I consider Alexander the earliest variety in commerce and that it should be planted (one tree at least) in every collection, as it prolongs the season when associated with Royal George and other favourite sorts. *W. Bewick, Besborough Court, Cork.*

—The Alexander Peach is quite distinct from Hales' Early, although very similar in appearance. We have both varieties here in our large Peach-house, and also on a south-east wall. The first fruit of Alexander was ripe inside on July 6, the first fruit of Hales' Early on July 16, and outside Alexander was ready on July 30, and Hales' Early on August 24. The first was raised by Mr. Rivers, Sawbridgeworth; the latter is of American origin, as are Waterloo and Amsden Juno; the two latter I consider almost identical with Alexander in every respect. [It is rather earlier, Ed.] For very early forcing I prefer Early Beatrice and Early Louise, the above American varieties being not quite so trustworthy. Early Beatrice requires to be on a very strong growing stock, it will then give large fruits; but for a cold house, or one to which very little fire-heat is applied, and for the earliest crop in the open, there is no variety at present known that is better than Alexander. *W. H. Divers, Kelton Hall.*

**WHAT IS AN HERBACEOUS PLANT?**—I have read the note by your correspondent, "A. D." above, and am inclined to the belief that he hardly realises the point I have endeavoured to raise, his dogmatic clearing up of the matter notwithstanding. Does "A. D." himself clearly understand the term "herbaceous" when he says, "When the term herbaceous is employed all real perennials should be excluded?" I think not. Are not all herbaceous plants true perennials? If not, how can they perform the function of "producing annual

flowering stems from a perennial root?" "A. D.'s" apparent definition of a perennial is that it is evergreen; but this is not essential; a plant may be perennial if deciduous, provided that it endures three or more years. No plant more decidedly performs its duties as an herbaceous plant than *Lilium candidum*; it is not "practically evergreen," as asserted by your correspondent, but as surely dies down annually, leaf and stem, as does a *Daffodil* or a *Tulip*; the radical leaves, which vanish with the uprising flower-stem, being renewed when flowering is complete, or in very dry seasons they do not appear till the early autumnal rains are experienced, "A. D." will pardon me not attributing my "doubts and difficulties" as he calls them to the same cause as himself, viz., "because the term herbaceous is still obstinately adhered to in schedules when all sorts of hardy border plants are invited to be exhibited." If your correspondent will turn to my original note he will find I distinctly refer to two original notes, that of the Royal Botanic and Royal Horticultural. In either case these societies would know what should be shown when they ask for a "group of hardy herbaceous plants," in their respective schedules, and would therefore not expect "all sorts of hardy border plants to be exhibited." What a sad confusion would the lax rendering of any schedule cause to the judges and exhibitors alike if the suggestion of "A. D." were carried into effect, for what have judges to guide them in arriving at their decisions but the *verbatim* rendering of the schedules? Particularly is this the case when one exhibitor stages his plants according to the requirements of the schedule, and another does not; for even supposing the former to be slightly inferior to the latter, the judges most assuredly would not give the premier position to the one who had departed from the wording of the schedule. There are plenty of really good herbaceous plants to be had now, and therefore the admission of either annuals or biennials should disqualify. Especially would I enforce this at our great London exhibitions, which should in reality be the school, as it were, for local and provincial shows. In offering a prize for hardy plants annually at our show in my district (of which I am a joint secretary), I employ the words "hardy perennials," to the exclusion of flowering shrubs. This is now so clearly understood by the exhibitors in this particular class, that we have no ground for complaint, and, from experience, I am of opinion that if framers of schedules for local shows would strive a little more to instruct exhibitors in such matters there would be an end of mistakes in this way, and this would be far more becoming to any horticultural society than an attempt to establish and cultivate an error so false as the admission of annuals and biennials among hardy herbaceous perennials. *E. Jenkins.*

**THE DANIELS POTATO.**—A few weeks ago you kindly made mention of a Potato called Daniels, and how well the variety looked when growing, giving great promise. We had a small local exhibition here the other week, and I was tempted to dig up my Daniels. They exceeded my expectations. I staged two dishes, and was awarded two prizes in a strong competition with different varieties in both classes. A friend of mine was present when I took up two roots to be weighed, one of which we found twenty-one Potatoes, and twenty on the other. On weighing the best root it was found to turn the scale at 6 lb., all good sound tubers, clean and free from scab. After exhibiting at Keighley, they were put to the test of being cooked for the table, and were found to be all that could be desired. *F. G., Epworth.*

**"DROPPERS" IN TULIPA SYLVESTRIS.**—I send a box with a few specimens of "sinkers," as we call them in Holland, in cultivated bulbs of *Tulipa sylvestris*. This peculiarity has been known here as long as I can remember, and it occurs principally and regularly with cultivated *T. sylvestris*. Usually at the bottom of the old bulbs there is found only one bulb, at the end of a long thread, of 10 to 30 centim. in length (there may be sometimes even longer ones); the fact that two bulbs are coming from the old bulb, as in one of the specimens sent, is an exception. There are some other *Tulips* where the new bulbs, when the beds are taken up, are found in the ground at a much lower level than the old ones were planted. This phenomenon is especially observed in some of the yellow and citron early single bulbs, which are known as *Ducs* (not *Duc van Thol*), such as *Duc Voorhelm*, *Duc d'Orange*, &c.; but up to the present the cords which in *T. sylvestris* are found between the old and the new

bulbs have not been found here. It may be that they have existed and have rotted at an early period, but this fact has not been observed. *J. H. Krelage, Haarlem.* [The specimens sent were illustrations of what English *Tulip* growers call droppers (fig. 30). The structure was obvious on cutting one open. The old bulb mostly decays, but one or more of its scales or leaves remains with an axillary bulb, which forms the new bulb. Then the scale or leaf grows downwards into the soil, carrying the bulb with it, so that at length there is a long tubular thread with the bulb at the bottom. This may be a protection from frost, or the inquisitiveness of birds and mice. Ed.]

**THE HEDGEHOG'S CRY.**—"Hystrix" (p. 189) has only just supplied me on this subject. Unless the hedgehog emits two distinct notes, I cannot at all account for the loud whistling noise heard by your correspondent, for here I have heard them giving a sound resembling that of a calf when sucking. Several evenings of late, when having a walk round the grounds, I have come on the hedgehog unawares, and have thus had an opportunity of noticing its ways—not its cries, for it appears to cry but rarely, and never (that I am aware of) when in danger. Whoever heard the hedgehog complain when being worried by a dog, or when trundled into the water? The noise is a sort of suppressed squeal mingled with a sucking noise; but this, be it remembered, is from the young ones. It is a disputed point as to what the cry really resembles. I think it varies with the age of the animal. *A. D. Webster.*

**THE MISUSE OF THE POTATO HAULM.**—Growers of Potatoes should be more careful as to what they do with blight-stricken haulms. The plan I adopt is to wheel them away, and burn them at once. It would seem that the mischief done by the haulms lying about is not realised by many persons, for I have seen farmers carting diseased haulm into the fold-yard to be made into manure, as they will tell you, and I have seen the same carted back to the field, there to wait until planting time came round when it could still be picked out by the forkful from among the rest of the manure. It is also a common practice amongst those who keep pigs to throw a few forkfuls of diseased haulm into the piggery, where the leaves are soon trodden out of sight, but the stalks are more enduring, and eventually get carted with the rest into the fields as manure. *F. G.* [Now that the consequences of such practice are known no words are strong enough to reprobate it. Ed.]

## SOCIETIES.

### ROYAL HORTICULTURAL.

August 28.—The Drill Hall was made to look very bright by the extensive display of cut spikes of *Gladioli* from Messrs. Kelway & Son, and by the charming group of *Orchids* arranged by Mr. B. S. Williams. Hardy flowers from Mr. Ware, and *Begonias* from Messrs. Cannell & Sons were also prominent; while from the Society's gardens at Chiswick there was sent a fine collection of *Asters* and *Stocks*, the floral display being of a lively and varied nature. Messrs. Veitch & Son had a collection of fruit which formed the chief object in the fruit division.

### Floral Committee.

Present: Rev. W. Wilks (Sec. R.H.S.), in the chair; and Messrs. Shirley Hibberd, H. Herbst, J. Fraser, J. Walker, W. Holmes, W. Goldring, R. Dean, B. Wynne, H. Ballantine, J. Dominy, H. M. Pollett, M. T. Masters, J. O'Brien, and E. Hill.

*Orchids* were not largely shown beyond the group from Mr. B. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, London, N., who had some excellent plants neatly arranged and displayed by Ferns and other foliage plants. *Cypripediums* were conspicuous objects. *C. tessellatum* porphyreum, not often seen, was represented by one plant; it has peculiar mottled dull red-brown flowers, not strikingly beautiful. *C. cananthum* was one of the brightest flowered shown, the rich madder-red of the lip and petals contrasting with the pure white margin of the dorsal sepal, which is green lined with red-brown spots towards the base; a variety of this, named *superbum*, differed in being more deeply red-coloured in the dorsal sepal, the margin being greatly reduced. Others were *C. Sanderianum*, the dorsal sepal of which is distinct and striking, being deep

brown with broad yellow lines; C. *Harrisianum*, C. *superbium*, and C. *Ashburtonii* *superbum*. A good piece of *Cattleya*, *Dowiana* was attractive, and also *Lelia* *Turneri*, *Mesopidinium* *vulcanicum*, and *Odontoglossum* *bictonense* var. *alba*, *Cattleya* *Eldorado* *splendens*, with a richly coloured lip, and *Pachystoma* *Thomsonianum*.

A number of *Sarracenia*s in good examples were sent by the same exhibitor, and a pan of *Drosera* *dichotoma*, *D. capensis*, *Dionaea* *muscipula*, and *Cephalotus* *follicularis*; also a very pretty variety of *Adiantum* *Capillus-Veneris* named *versailleense*, in which the pinules spring from the summit of the rachis in a tuft, as in the variety *Luddemanniana*, but more loosely, giving a graceful and light appearance, yet compact; it makes a capital pan plant. Hybrid greenhouse *Rhododendrons* and a few *Amaryllis* completed the display.

Mr. Robbins, gr. to W. Vanner, Esq., Camden Wood, Chislehurst, sent a well-flowered plant of *Odontoglossum* (*Miltonia*) *Karwinskii* with a spike about 4 feet in length; it is a form of *O. laeve*; the lip was wholly of a soft lilac-violet colour.

*Cattleya* *Loddigesii*, *Le Doux's* variety was shown by Mr. Rhymer, gr. to A. le Doux, Esq., Langdon House, East Moulsey; sepals and petals delicate mauve-lilac, with a slightly lighter lip, pale cream-coloured at the margin. It was in excellent condition, and bore a number of flowers.

*Disa laccra*, not frequently to be seen, was shown from Mr. G. W. Cummins, gr. to A. H. Smee, Esq., The Grange, Wallington; it is not a very showy species, but the flower of a most pleasing light violet hue; the lip is most fringed, and is darker than the rest of the flower.

Mr. G. T. White, Drayton Villa, Winchmore Hill, N., had a *Trichocentrum*, to which he had given the name *Ella*; it attains a height of about 4-6 inches; flower cup-shaped, dull white, spotted with dull rosy-lake; lip similarly coloured, but with a yellow crest.

Messrs. H. Cannell & Sons, Swanley, Kent, had a group of single and double tuberous *Begonias*, embracing a great range of colour, and of which some were very beautiful. The *Lady* a single white variety, almost circular in form, and with pale stamens, was very noticeable, and moreover was of dwarf habit. Mrs. Lynch was a good double of a delicate rosy-pink colour, and each segment frilled, and the whole flower of fine form. Mrs. Lascelles was a dull, deep pink, of large size (double), and Mrs. Berkeley was also good, being deeper and brighter in colour than Mrs. Lascelles. Messrs. Cannell also sent a number of *Cannas*, of which the following were selected for Certificates:—Admiral Courbet, light yellow, spotted with orange-red, with very large and broad foliage; Madame Just, in which the outer segments were orange and broad, the inner narrow and scarlet; Francesque Morel, rich crimson, large flowered; Capricieuse, scarlet, with a yellow margin—a striking object.

The collection of spikes of *Gladioli*, numbering about 100, from Messrs. Kelway & Son, Langport, was probably the chief item of the show. Several new varieties were to be seen, some of which were awarded Certificates by the committee. The individual flowers were large, and the combinations of colours very pleasing, some of the finest were:—Bullion, sulphur-yellow with a few red flakes; Mago, bright crimson with white in the throat; Nicon, very pale pink, with the inner segments pale yellowish, faintly flaked with pink on all; Accia, rich crimson, lighter in the throat; Magas, white with the very faintest suspicion of pink suffusion, with a pink line in the throat; Cebes, magenta; Pompus, brick-red, purplish throat; Lyde, lilac-pink; and Dares, salmon with scarlet spots and a lake colour in the throat. This form also sent a number of pretty *Gaillardias*, one named *splendissima plenissima*, a double flower, being the greatest novelty. It is deep blood-red tipped with yellow. They also showed a few very good spikes of *Delphiniums*—Horus, deep blue, with a white centre, was especially fine. Rob Roy, light blue; and Lycas, rich azure, were other good forms. *Funkia grandiflora* and *Lobelia splendens* were well shown by Mr. W. Roupell, Harvey Lodge, Hounslow Park, S.W.

Mr. J. F. West, gr. to W. Keith, Esq., Brentwood, sent a few *Dahlias*, *Beauty of Brentwood* (Cactus), rich and bright purple-lake, was a specially fine flower. Ethel Keith, also a Cactus form, was yellow and white, but not so favourably received.

Some fine stands of African *Marigolds* were shown by Messrs. Veitch & Sons, Chelsea, some measuring as much as 4 inches in diameter; and in colour rich orange, pale lemon, and others were striped yellow and brown, the latter being of smaller dimensions.

A large and varied collection of Stocks and Asters was staged from the Society's Gardens, Chiswick, the finest of which are referred to in the report of the Chiswick Committee in another column. The colours were very bright and greatly varied, the Asters looking particularly well. Cut spikes of *Hedychium* *Gardinerium* were also shown, and very pretty objects they are too.

*Dahlias* were largely contributed by Messrs. Cheal & Son, Crawley, Sussex, and were arranged in their new stands for flowers, by which means they were well displayed. The following were the most noticeable of "Cactus" varieties:—Mr. Tait, white; Annie Harvey, rich red; General Gordon, light scarlet. The pompons were, as usual, popular varieties, but the single varieties contained one or two distinct varieties; the best were:—Mr. Rose, white, heavily flaked with crimson-lake; Sunningdale Yellow, bright yellow; Miss H. Cameron, lilac; Duchess of Albany, lilac, with large decidedly brown flakes—a highly striking variety, and totally distinct, the combination of

*Delphinium* *Horus*, from Messrs. Kelway & Son. *Gaillardia splendissima plenissima*, from Messrs. Kelway & Son.

*Begonia* (double) Mrs. Lynch, Messrs. H. Cannell & Sons.

*Begonia* (double) Lascelles, from Messrs. H. Cannell & Sons.

*Begonia* (single) The Lady, from Messrs. H. Cannell & Sons.

*Canna* Admiral Courbet, from Messrs. H. Cannell & Sons.

*Canna* Madame Just, from Messrs. H. Cannell & Sons.

*Canna* Francesque Morel, from Messrs. H. Cannell & Sons.

*Canna* Francesque Morel, from Mr. T. S. Ware.

*Dahlia* (single) Victoria, from Messrs. Cheal & Sons.

*Dahlia* (single) Duchess of Albany, from Messrs. Cheal & Sons.

*Adiantum* *versailleense*, from Mr. B. S. Williams.

*Dahlia* (Cactus) *Beauty of Brentwood*, from Mr. J. T. West.

*Odontoglossum* *Karwinski*, from W. Vanner, Esq.

*Campanula isophylla* *alba*, from Mr. T. S. Ware.

#### BOTANICAL CERTIFICATES.

*Disa laccra*, from A. H. Smee, Esq.  
*Trichocentrum Ella*, from Mr. G. T. White.

#### MEDALS.

*Silver-gilt Banksian*.—To Mr. B. S. Williams, for group of plants.

*Silver Banksian*.—To Messrs. Kelway & Son, for collection of *Gladioli*.

*Bronze Banksian*.—To Mr. T. S. Ware, for group of plants; to Messrs. J. Cheal & Sons, for collection of *Dahlias*; to Messrs. H. Cannell & Sons, for group of *Begonias*.

#### Fruit Committee.

Present:—T. Francis Rivers, Esq., in the chair; and Messrs. J. Lee, R. D. Blackmore, I. J. Saltmarsh, G. W. Cummins, J. Barnett, W. Marshall, and P. Barr.

Messrs. H. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, S.W., had an interesting collection of fruits, which were some of the best varieties of Plums, such as *Gisborne's*, *The Czar*, *Blue Gage*, *St. Etienne*, *Rivers' Early Prolific*, *Wilmot's Orleans*, and *Dennison's Superb*, all fine examples. Of Apples, there were good clean examples of *Keswick Codlin*, *Gladstone*, *Irish Peach*, *Red Quarrenden*, *Lord Suffield*, and *Worcester Pearmain*; and also a dish of good *Jargonelle* Pears. A dish of handsome fruits of *Peach Sea Eagle* was a noteworthy object, the fruit being large and finely coloured.

A few good samples of Plums were also sent from Chiswick, the best samples being *Blue Gage*, *July Green Gage*, and *Mamelonne*.

Mr. W. Roupell had a basket of some of the old Grapes rarely to be seen now-a-days, and which possess flavours of high quality. The varieties shown were the true *Chasselas Musqué*, *Primavis Frontignan*, and *Purple Constantine*; he also had American Grapes, which do not meet with much appreciation in this country. *Duke of Buccleuch* was also shown in fine condition. All had been grown in pots. A few Melons were shown, but none of particular merit. Mr. O. Thomas, Chatsworth Gardens, Chesterfield, sent a precocious Grape, about which the committee desire further evidence. Messrs. Harrison & Sons, Leicester, had *Green Emperor Broad Beans*, evidently a prolific variety.

#### General Meeting.

At a general meeting, the Rev. W. Wilks, Hon. Sec., in the chair, the following candidates were duly elected Fellows, viz.:—Miss Browning Hail, Mr. Thos. Butcher, Mr. S. C. Clay, Mr. Edw. Cumberlege, Mr. H. M. Cumberlege, Mr. Jas. H. Forwalk, Mr. C. A. Harris, Mr. C. B. Saunders, Mrs. Spencer, Mr. A. W. Tait, Mr. H. A. Thompson, Mr. Theodore Waterhouse, Mr. John Watkins, and Mr. A. L. Wigan. Mr. R. B. Gall was elected an Associate.

#### Chiswick.

##### FRUIT AND VEGETABLE COMMITTEE.

A meeting of this committee was held on the 21st ult. at Chiswick. Present: Mr. W. Warren, in the chair; and Messrs. Howe, Cheal, Barr, Den-

FIG. 30.—TULIP "DROPPERS": THE NEW BULB IS PLACED AT THE BOTTOM OF A TUBE OR SHEATH PROLONGED DOWNWARDS.

colours not being at all unpleasant; *Victoria*, white, with broad dark crimson band on each side, was also a very distinct variety of great beauty, and likely to become a favourite.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, had a collection of cut *Dahlias* and other flowers. Iceland *Poppies*, *Papaver bracteatum*, *Montbretia crocosmæflora*, M. Pottsi, *Alströméria chilensis*, *Polemonium Richardsoni*, *Lobelia splendens*, *Scabiosa caucasica*, *Lilium Batemannia*, &c., were conspicuous; also *Campanula isophylla* *alba*, one of the prettiest of the *Campanulas*, and eminently suited for growing on rockeries; and *Canna* *Francesque* Morel, deep crimson.

##### FIRST-CLASS CERTIFICATES.

*Gladioli* *Cebes*, from Messrs. Kelway & Son.

*Gladioli* *Bullion*, from Messrs. Kelway & Son.

*Gladioli* *Accia*, from Messrs. Kelway & Son.

*Gladioli* *Magas*, from Messrs. Kelway & Son.

*Gladioli* *Nicon*, from Messrs. Kelway & Son.

*Delphinium* *Horus*, from Messrs. Kelway & Son.

ning, Smith, Wright, Marshall, and Cummins. The following crops on trial this season were inspected:—

1. *Potatoes*.—A collection of eighty-six varieties being grown. With very few exceptions they were found to have suffered severely from disease, the early varieties more especially so. The following varieties proving to be good croppers and of fine appearance, were subjected to the test of cooking, viz., Governor (Dean), Lavington Conqueror (Lye), Epicure's Delight (Smith), Vegetarian (Dean), Renown (Webb & Son), Débutante (Ellington), Castle Morton (Collins), Nelly Blue Eyes (Dean), Basford Beauty (Howard), Bluebeard (Dean), Purple Beauty (Dean), Stirling Castle (Murdoch). None of them was considered of superior quality, being somewhat watery, a result attributable to the excessively wet season.

2. *Cabbages, Spring-sown*.—A collection of forty varieties. The following were selected as the most desirable varieties to cultivate for use at this season, viz., Early Etampes (Vilmorin), Early Paris Market (Vilmorin), Leeds Market (Rutley & Silverlock), Prince's Nonpareil, Early Dwarf York.

3. *Tomatoes*.—A collection of fifty-two varieties, grown in pots. None of these were considered superior to sorts certificated in 1887, and now in general cultivation.

#### FLORAL COMMITTEE.

A meeting of this committee was held on the 24th ult., Mr. H. Herbst in the chair. Present: Messrs. Walker, Dean, Laing, Noble, Goldring, Masters, Lowe, Hibberd, Pollett, Bates, Dornay, Fraser.

The collections of Stocks and Asters on trial in the gardens were examined. Of the large-flowering Ten-week Stock from Messrs. Vilmorin the following colours were selected as the most distinct, and awarded three marks, viz., white, sulphur, lilac, blood-red, violet, light violet. Of the same section, from Messrs. Benary, the white, dwarf white, brick-red, and light blue, received three marks; also of the Dwarf German Chamois and those of the new Giant Perfection (Benary), sulphur-yellow and light blue, received three marks, and the dark blood-red from the Novelty Company.

Amongst the Asters the following received three marks:—Half dwarf: Multiflora, white; ditto, light yellow (Vilmorin); Globe Pæony-flowered, copper coloured, white edge (Vilmorin). Dwarf: Chrysanthemum, rose (Vilmorin); and ditto, scarlet-red (Vilmorin); Dwarf Queen, crimson (Benary); Dwarf Queen, white (Benary); Mignon (Benary). Pyramidal: Hedgehog or Needle, dark crimson (Benary); large flowered rose, dark scarlet (Benary); Triumph (Novelty Company). The following assortments of various colours from Benary were commended, viz., double dwarf, early flowering, fourteen vars.; dwarf bouquet flowered (Bolteus), eight vars.; dwarf Chrysanthemum flowered, ten vars.; dwarf pyramidal flowered, twelve vars. The later varieties will be further examined.

#### STOCKS AT CHISWICK.

Mr. Barron maintains the practical and useful work he does at the Chiswick Gardens of the Royal Horticultural Society by this season carrying out a very successful and extensive trial of Ten-week Stocks. No annuals are more grown, probably, than the German Stock; they are so floriferous, so bright, and varied in colour, so fragrant, and so easily managed, that it is not to be wondered at the popular Stock Gillyflower maintains its ascendancy in the flower garden. And so great has been the improvement in types and varieties during the past few years that they are even more attractive and useful as decorative agents than they were a few years ago. About four distinct types may be found in the trial at Chiswick, viz., the dwarf Ten-week, the dwarf pyramidal large-flowering Ten-week, the large-flowering Ten-week, and the Giant Perfection. The finer types have, no doubt, been obtained by means of selection, and by possessing varying characteristics they can be used for different purposes by the gardener, according as his taste or humour may incline him.

The Stocks tried comprised those put into circulation by Messrs. Vilmorin Andrieux & Co., of Paris, and Mr. Ernest Benary, of Erfurt. Of the large-flowering type of Vilmorin & Co. three marks, which are equivalent to a Certificate of Merit, were given to the following colours:—White, yellow, lilac, blood-red, purple, and light violet—all distinct and decided colours. Of the large-flowering type of Ernest Benary—and the high quality of both strains appeared to be identical—the following were selected for three

marks:—Two white, one dwarf and one taller; Chamois was fawn, purple, and ash-grey. Of all the types of Stock this appears to be the most useful, and in each case the percentage of double flowers was very large. There are other colours, all with good double flowers—too many colours, indeed, and combinations of colours; but it appears to please the Continental growers to select as many as possible, probably to make up bulky collections. Benary's type of large flowering dwarf pyramidal is of a more erect habit of growth, and not so branching. The only one of this type selected for three marks was a very fine white and a dark scarlet or crimson, growing to a height of 15 inches, very fine and showy. Of Benary's type of dwarf Ten-week, a very useful and compact-habited Stock, suitable for beds or massing, the following three varieties were awarded three marks:—Lilac-rose, violet, and yellow.

The finest, tallest growing, and most showy type of Stocks is that known as the Giant Perfection; and especially is this adapted for exhibition purposes where bold spikes are required; the general height may be stated at 18 inches. Probably it was owing to occupying a more favourable position, but Benary's strain appeared to be rather finer in development than Vilmorin's; still there was little to choose between them in point of quality. The following varieties from Mr. Ernest Benary received three marks:—Yellow, blush, and light blue.

It is pleasing to record the advance made in the yellow Stocks, as the shades are being deepened, and the green is giving place to a truer tint of yellow. The Wallflower-leaved Stocks are quite a distinct race, but with very few exceptions they lack robustness of character, and are therefore not so popular as the woolly-leaved strains.

A rich crimson Ten-week Stock, named Victoria, sent by the Novelty and Specialty Company, Newton-le-Willows, was also awarded three marks. It is a charming variety for bedding or pot culture. R. D.

#### TROWBRIDGE HORTICULTURAL.

August 22.—This busy Wiltshire town fully maintained its old prestige by holding a capital exhibition on the above date; and by the townspeople coming out very strong in the way of decoration. The railway station was very gay indeed, and as the weather was fine, the effect was good throughout. The show took place as usual in the field adjoining the railway station, and was largely attended.

*Plants, Stove and Greenhouse*.—In the leading class for nine specimens, Mr. G. Tucker, gr. to Major W. P. Clarke, Trowbridge, took the 1st prize with a good fresh lot, his leading plants being *Statice profusa*, *Stephanotis floribunda*, *Dipladenia amabilis*, *D. Brearleyana*, finely bloomed; *Lapageria alba*, and *Allamanda Hendersoni*; 2nd, Mr. J. Matthews, gr. to W. R. Brown, Esq., J.P., Trowbridge, his best specimens being *Bougainvillea glabra*, *Erica Maroccaniana*, *E. Macnabiana*, *E. ampullacea*, and *Rondeletia speciosa major*.

In the amateur class for six plants, Mr. H. Pocock, gr. to J. P. Haden, Esq., Trowbridge, had very good specimens of *Oncidium flexuosum*, *Dipladenia amabilis*, *D. Brearleyana*, *Stephanotis floribunda*, and *Allamanda nobilis*; 2nd, Mr. G. Tucker. Mr. J. Matthews, came in 1st with the best three.

The best new or rare plant was shown by Mr. J. Hiscocks, gr. to E. E. Bodway, Trowbridge, who had a good piece of *Anthurium Van Houttei*; Mr. J. F. Gould being 2nd with *Impatiens Hawkeri*.

Mr. Tucker had the best six plants of Achimenes. Some very good plants of Gloxinias were shown by Mr. C. Richmond, gr. to G. L. Palmer, Esq., Trowbridge, and Captain Tucker.

Tuberous-rooted Begonias, both double and single, shown in sixes, made an excellent feature, Mr. G. L. Palmer being 1st in both classes.

Mr. G. Pynner, gr. to Mrs. Goldsmith, Trowbridge, was the only exhibitor of four Orchids, having well-grown and bloomed pieces of *Cattleya Loddigesi*, *C. Eldorado*, *Odontoglossum citrosum*, and *Cypripedium Stonei*.

Mr. J. F. Gould had the best six Heaths, *Fuchsias*.—These, always such a fine feature at Trowbridge, though remarkably well shown, were not yet up to their usual average, it being the practice of the growers to finish off their plants in the open air, they showed the effects of sunless days and cold nights. Mr. G. Tucker, who is one of the leading Wiltshire growers, came 1st, with very good plants of the following six varieties:—Charming, the Hon. Mrs. Hay, Thomas King, and Dell's Favourite, dark varieties; and Harriet Lye and Arabella, light

varieties. 2nd, Mr. H. Pocock. Mr. Matthews had the best four varieties, having very good plants of the Hon. Mrs. Hay, Bountiful, Rose of Castille, and a seedling; 2nd, Mr. Tucker, with Charming, Thomas King, Mrs. Rundle, an excellent exhibition and decorative variety, and Bountiful.

In the cottagers' division could be seen specimen *Fuchsias* much superior to what are generally seen at horticultural exhibitions.

*Miscellaneous Flowering Plants*.—Among these were zonal Pelargoniums, *Petunias* trained to large oval wire trellises and finely bloomed, and *Verbenas* the same. Balsams and Cockscombs were also good for the season, and all furnished good and pleasing patches of colour.

*Foliage Plants*.—The best lot of nine came from Colonel Pepper, who had the following *Crotons* in good character:—Weismanni, Queen Victoria, Countess, and Johannis, also *Kentia australis*, *K. Fosteriana*, and *Latania borbonica*. *Caladiums* were a good feature, the plants being well grown and finely marked. *Coleus* were a very good feature also, strongly grown plants having handsomely variegated foliage. Messrs. Matthews and Pocock were severely 1st and 2nd in both the last mentioned classes.

*Ferns*.—These are always well shown at Trowbridge, although fifteen specimens of Ferns and mosses are required, and good-sized well-developed plants are always to be seen. Mr. Tucker came in 1st, with a very good, even, varied, and well-grown collection; Mr. J. Coke, gr. to A. P. Stancomb, Esq., Trowbridge; and Mr. H. Pocock, being equal 2nd. The handsome Silver Fern, *Cyrtogramma peruviana argyrophylla* is always a good feature in the Trowbridge collections.

*Cut Flowers*.—These are always a prime feature at Trowbridge, and, notwithstanding the character of the season, they were generally in good form. Roses were numerous, and very good; the best twelve varieties, three blooms of each, came from Mr. J. Mattock, nurseryman, Headington, Oxford, who had excellent blooms of *Madlle. Marie Verdier*, *Souvenir d'Elise*, *Marie Baumann*, *Marie Van Houtte*, *Souvenir d'un Ami*, *Alfred Colomb*, *Madame Lambert*, *Devoienis*, *Lady Sheffield*, *Rubens*, *Dupuy Jamin*, and *Catherine Mermet*, the Tea-scented varieties being remarkably fine. 2nd, Messrs. Keynes, Williams & Co., nurserymen, Salisbury, who had very good blooms *Ulrich Brunner*, *The Bride*, *Beauty of Waltham*, *Alfred Colomb*, *Marie Verdier*, *Marshall P.* Wilder, and *Madame Eugene Verdier*.

In the class for twenty-four blooms, Dr. Budd was a remarkably good 1st, the leading flowers being *Comtesse de Nadailac*, *Madame Lambert*, A. K. Williams, Mrs. John Laing, *Marie Baumann*, *Catherine Mermet*, *Souvenir d'Alphonse Lavallé*, *Innocenta Pirola*, *Fisher Holmes*, *Alfred Colomb*, &c.

In the amateur division, Dr. Budd was 1st with twelve varieties, three blooms of each, and also with twelve single blooms. Mr. Humphries also staged a box of blooms of *Cactus* and decorative *Dahlias*, having in good character *Juarez*, *Charming Bride*, Mrs. Hawkins, *Empress of India*, one of the most distinct and best; F. C. Henley, *Constance*, *William Pearce*, *Lady Kerrison*, &c. A pretty rosy-pink seedling is of a promising character.

*Miscellaneous Cut Flowers*.—Hollyhocks were fairly good; *Gladioli* not up to the usual mark, both showing the hostile character of the season. *Fansies* were as good as could be expected at this late season. French and German Asters were very good, but not so fully developed as one is accustomed to see them the third week in August. *Carnations*, *Picotees*, *Clematis*, and *Verbenas* were numerous and generally of good character. Zonal Pelargoniums, in bunches of five trusses, were very fine indeed, and made a great display. Collections of hardy annuals, shown in twelves, were remarkably good, and served the useful purpose of showing what fine things can be grown under this heading.

*Table Decorations, Bouquets, &c.*—The former were very good, arranged in one class with garden, and the other with wild flowers. Bouquets, wreaths, and buttonholes were also good. Some charming collections of wild flowers grown within 12 miles of Trowbridge were also staged.

*Dahlias*.—The best stand of twenty-four show varieties came from Messrs. Keynes, Williams & Co., who had fine blooms of *King of Crimsons*, J. T. West, *Henry Keith*, Hon. Mr. P. Wyndham, *William Rawlings*, *Royal Queen*, *James Service*, *Colonist*, J. N. Keynes, Mrs. Langtry, *Henry Walton*, *Harrison Weir*, Mrs. Gladstone, *George Dickson*, *Herbert Turner*, Mrs. Shirley Hibberd, *Joseph Ashby*, and

seedlings. The best twelve varieties came from Mr. Sidney Cooper, Chippenham.

Messrs. Keynes & Co. had the best twelve fancy Dahlias—a very good stand also—the leading varieties being Prince Henry, Rev. J. B. M. Camm, Pelican, Peacock, Mrs. Saunders, Rebecca, Gaity, Chorister, a sport from Gaity, yellow, tipped with white; Frederick Smith, and seedlings.

Single Dahlias were well shown, Mr. A. A. Walters, nurseryman, Bath, being 1st, with a very fine lot, showing one bloom only of each.

Pompon Dahlias, in bunches of four flowers, were a capital feature, Messrs. Keynes, Williams & Co. being 1st, with some remarkably good varieties, consisting of Janet, Gem, Golden Gem, Darkness, Lady Blanche, Favourite, White Aster, Grace, Lelia, and seedlings.

**Fruit.**—As is general, this season's collections of fruit scarcely come up to their usual extent and quality. The only collection of varieties on this occasion came from Mr. A. Miller, gr. to Walter H. Long, Esq. M.P., Rood Ashton, Trowbridge, a very good lot indeed, consisting of Alicante and Foster's Seedling Grapes, Barrington Peaches, Violet Hative and Stanwick Elrange Nectarines, Moor Park Apricots, Brown Turkey Figs, Melons, &c.; Mr. W. Iggulden, gr. to the Earl of Cork, Marston House, Frome, had the best six dishes, consisting of Black Hamburgh and Foster's Seedling Grapes, Grosse Mignonne Peaches, Moor Park Apricot, Pine-apple Nectarine, and a Melon. The best two bunches of black Grapes were highly finished, viz., Black Hamburgh from Mr. J. Gibson, gr. to Earl Cowley, Chippenham; Mr. A. Miller being 2nd with the same variety, also in excellent character. The best productions of white Muscats excluded, were Buckland Sweetwater, from Mr. Iggulden; Mr. J. Attwell, gr. to T. B. Brain, Esq., Bristol, being 2nd with the same. Messrs. Gibson and Ashwell were severally 1st and 2nd with Black Muscats, showing good Madresfield Court. Mr. Iggulden was 1st with White Muscats. The best Peaches were Royal George and Grosse Mignonne; the best Nectarines were Pine-apple and Elrange. Melons were fairly plentiful. The best Desert Apple was Beauty of Bath; the best culinary, Lord Salfield, shown very fine indeed. The best dessert Pears were Doyenné d'Ete and Jargonelle. Miss Lily Durbin, and Mr. Hoskings, of Clifton, were severally 1st and 2nd, with a centrepiece arranged with fruit and flowers.

**Vegetables.**—These were numerous and remarkably fine. This remark applies to those produced by cottagers as well as in the open class. Mr. G. Garaway, of Bristol, had the best collection of nine varieties. Potatoes were a great feature, and as they are shown with a much larger number of tubers composing a dish than is usual, they make quite an imposing display. Tomatoes were very fine, the Perfection type being to the fore.

## WILTS HORTICULTURAL.

**SALISBURY, AUGUST 23.**—The annual summer show was held in the Palace grounds, and was in every way a success, a grand all-round display of plants, cut flowers, fruits, and vegetables being got together.

For twelve stove and greenhouse plants, distinct, six foliage and six flowering, £15, £10, and £5 were offered as prizes. Mr. G. Lock, gr. to W. B. Cleam, Esq., Crediton, secured the premier position, with magnificent specimens, the most remarkable among them being Erica Eweriana, 5 feet over; E. amula, Clerodendron Balfourii, Bougainvillea glabra, Eucalyptus villosus ampliatus, Latania borbonica, very large, and splendidly coloured Crotons. Mr. J. Cypher, Cheltenham, was 2nd, his plants being smaller, but very good and even. Bougainvillea glabra and Ixora Fraseri, were the best.

For a group of plants arranged for effect in semicircle 12 feet in diameter, Mr. Lock was 1st, with a very light and pretty arrangement, the materials being well chosen, and put together in finished style; Mr. Wills being 2nd with a bright group. Mr. Lock was again successful for six stove and greenhouse plants in bloom, with medium-sized, well-flowered specimens of Dipladenia amabilis, Erica Fairiana, E. Aitoniana, Ixora Duffii, Allamanda Hendersoni, and Phenocoma prolifera Barnesi; 2nd, Mr. Wills, Eucharis amazonica and Clerodendron Balfourii being very fine in his lot.

Exotic Ferns were shown in capital condition. In the class for six, distinct, Mr. Wills was 1st, with large healthy specimens.

Mr. H. W. Ward, gr. to the Earl of Radnor, Longford Castle, Salisbury, had the six best Begonias, with well-flowered plants.

Fuchsias were represented by well-flowered plants of medium size, Mr. Wills winning 1st honours with such well-known varieties as Charming and Beautiful.

In the gardener's class for a group of plants, arranged in a semicircle, 10 feet in diameter, Mr. Lock was again to the fore with a very effective display, thereby winning the £5 Cup or money given by the Messrs. Keynes, Williams & Co. Seven lots were put up, all of which were wonderfully well done.

Two other classes were provided for groups, the prizes to be competed for by amateurs living within a radius of 6 miles of Salisbury. So well were they put up that they deserve special mention. Mr. L. Browne was 1st (in the class were a semicircle 10 feet in diameter had to be covered), with a very light and pleasing combination; 2nd, Dr. W. Coates, whose background of Palms was very effective. Mr. Gregory won the 1st prize for a group of the same shape but 2 feet less in diameter.

**Fruit** was largely and well shown, with the exception of hard kinds, the collections, black Grapes and Peaches, being especially good. For eight dishes of fruit, Mr. Ward secured the premier position, showing compact bunches of Madresfield Court, large in berry and splendidly coloured; Muscat of Alexandria, large in bunch and of good colour; a large scarlet Invincible Melon, good Smooth Cayenne Pine and Pine-apple Nectarines, Negro Largo Figs, Goshawk Peach, and Moor Park Apricots. Mr. Evans, gr. to Lady Louisa Asburton, Melchet Court, Romsey, Hants, was a close 2nd, his best dishes being well coloured Black Hamburgh Grapes, grand Brunswick Figs, good Barrington Peaches, and Moor Park Apricots, and William Tillery Melon; Mr. A. Miller, gr. to H. W. Long, Esq., M.P., Rood Ashton Park, Trowbridge, was a good 3rd, having a splendid Smooth Cayenne Pine, but not quite ripe, and good Peaches, Nectarines, Figs, and Melons. For one Pine, Mr. Lock was 1st, with a large well ripened Smooth Cayenne; Mr. Ward being a close 2nd with the same variety.

Mr. J. Northeast, gr. to Mrs. Torrence, Norton House, Warminster, was 1st for three bunches of Muscat of Alexandria Grapes, with large well coloured bunches.

The next class, for three bunches of Black Hamburghs, was a very strong one, Mr. Chalk, gr. to G. Read, Esq., Westwood, Salisbury, taking 1st, with very large and beautifully coloured examples; Mr. Ward following with smaller, but equally well coloured bunches; the latter also led for any other white, with good Buckland Sweetwater, and for any other black, Mr. Ward again secured the post of honour with Gros Maroc.

For the best flavoured Melon, Mr. Neville was 1st, with Sutton's Imperial Green-flesh; and Mr. Evans was 2nd, with Read's Scarlet-flesh.

Mr. Englefield, Tedworth House, Marlborough, was easily 1st for a single dish of Peaches, showing Walburton Admirable, very large and highly coloured; Mr. Rudd was 2nd, with Barrington. The prizes for Nectarines were awarded to Mr. W. Browning, gr. to Sir Talbot Baker, Bart., Blandford, and Mr. Ward in the order named. Mr. Browning was also 1st for Apricots, with very fine fruits, of Moor Park, and for six dishes of Apples; and Mr. Englefield led for Plums; and Mr. F. Smith for four dishes of Pears.

**Vegetables.**—Fine collections were put up, the 1st and 2nd prize ones being very close in point of merit. Mr. Wilkins was placed 1st—he put up good dishes of Rousham Park Onion, Standard Bearer Celery, Advance Cauliflower, Giant White Beans, and dark-red Beet; Mr. Haines following closely, showed very fine Reading Perfection Tomatoes, Anglo-Spanish Onion, Satisfaction Potatoes, and Jubilee Beans.

**Cut Flowers** were not numerous, but in some cases were well shown. Mr. Campbell, gr. to Dr. S. P. Budd, Bath, was 1st for twenty-four Roses; Dr. D. Seager, Bitterne, Hants, 1st for twelve Mr. Harkins, Salisbury, occupied a like position for single and pompon Dahlias; Mr. N. Gilbert, Bishop's Waltham was first for eighteen Carnations or Picotees. The same exhibitor showed flowers of a seedling border Carnation named Edwin Molyneux, which was a very promising variety; Mr. Chard, Stoke Newington, was 1st for a dressed flower vase, and also for two bouquets, all of them being set up in his usual style.

**Miscellaneous Exhibits.**—A goodly number of exhibits were put up, not for competition. Messrs. Keynes, Williams & Co. arranged groups of Palms

and Lilies at one end of the large tent, and they also put up grand stands of Roses and Dahlias. The many beautiful blooms among the Cactus and Dahlias came in for a large share of attention from the visitors. Mr. R. Davis, of the Yeovil Nurseries, contributed a bright and imposing stand of Begonias among the doubles. Mr. B. Latham, High Street, Shirley, Southampton, showed a good collection of herbaceous cut flowers and seedling Petunias in pots; and Mr. Brittan, Salisbury, a tastefully arranged exhibit of miscellaneous plants and cut flowers, all of which commanded a good deal of attention.

## SEVENOAKS HORTICULTURAL.

**AUGUST 22.**—A capital exhibition took place in Montpel Park, the seat of the Right. Hon. Earl Amherst. The flowering groups set up for effect—always a feature at this show—were exceptionally good, as were the table decorations. Stove and greenhouse plants were well shown by Mr. Gibson, gr. to T. F. Burnaby Atkins, Esq., Harefield, Bucks.—indeed, his specimen plant of Dipladenia was one of the best that has ever been shown, having 47 trusses of bloom, and no less a number than 587 blooms had already been picked off. Mr. Gibson said that it commenced to flower on May 9 last.

Ornamental foliage plants and exotic Ferns were well shown by Mr. Goodman, gr. to Mrs. Crawshaw, Bradbourne Hall; and Mr. A. Hutton was well to the front with Caladiums and table decorations.

Groups not for competition were shown by Messrs. Laing & Sons (Forest Hill), Cutbush (Highgate), Webber (Tonbridge), Cheal & Sons (Crawley), Seale (Sevenoaks), and Edmonds (Westerham).

Vegetables were generally good, and the competition keen, but the fruit was not quite up to the quality of some previous years, if exception be made to the Grapes shown by Mr. T. Osman, of Chertsey, which were very fine examples.

## ROYAL HORTICULTURAL OF IRELAND.

**AUGUST 23.**—The autumn show was held under favourable auspices. In many classes the number of exhibits was limited, but of high merit; splendid Grapes were shown from the Earls of Wicklow and Clancarty, who took 1st and 2nd prizes in the order named for three varieties, two bunches of each, finely finished and coloured.

The excellent stands of Roses and Dahlias from Messrs. Alex. Dickson & Sons, of Newtownards and Belfast, were, however, the special feature of the show. They included, first, a stand of forty-eight, all different, in grand condition, and for which the Society's 1st prize in the nurserymen's class was awarded. In this stand were splendid blooms of Messrs. Dickson's new certificated hybrid pedigree varieties, such as Earl Dufferin, dark velvety-red; Lady Helen Stewart, crimson-scarlet; Lady A. Hill, cerise-pink; and Miss Jennie Dickson, silvery-rose. In this stand also were effective blooms of Her Majesty, Mrs. John Laing, Chas. Lefebvre, and Duc de Rohan. They had also awarded to them the Society's Silver Medal for two other stands of forty-eight Roses—not for competition. Another of Messrs. Dickson's specialties, and for which they had similar honours, were stands of forty-eight show and fancy Dahlias in fine condition. Mr. McCormick, Swords, had 1st in amateurs' class of thirty-six Dahlias.

## ROYAL HORTICULTURAL OF ABERDEEN.

**AUGUST 23, 24, AND 25.**—The floral *fête*, held under the auspices of the above Society, was held in the Duthie Public Park, Aberdeen, on the above dates, in fine weather. The entries numbered 1501 as against 1011 last year, the details of this year's being—For pot plants, 287; cut flowers, 486; fruit, 263; and vegetables, 525. The pot plants, cut flowers, and stove and greenhouse plants, Potatoes, and fruit were shown in the large marquee situated at the east side of the grounds, and considering the backward nature of the season the display was really an excellent one. The most striking feature in it was the stand in the centre, near the entrance, of pot plants, which included very fine Fuchsias, Begonias, Lilioms, and Pelargoniums; and a remarkable specimen of the British Fern, *curtium cristatum*.

Mr. Alexander Grigor, gr. to Mr. A. O. Gill, of Fairfield, Aberdeen, had a fine display. A little further on was a fine collection of horticultural produce by Mr. John Proctor, gr. to Mr. Henderson, Lord Provost of Aberdeen. It was a mixed collection, and included Palms, Crotons (fine in colour), and Orchids in bloom. There was also a pretty *Cissampelos* Dampieri, one of the best specimens that could be produced. In Mr. Proctor's collection of six stove or greenhouse plants were a *Clerodendron Balfourianum*, particularly well flowered; a beautiful *Eucharis amzonica*, and a fine Palm. A table of flowers by Messrs. Smith & Son, seedsmen, Aberdeen, was a great attraction. It contained a selection of herbaceous flowers, also Gladioli, Roses, and Carnations, besides many choice and valuable stove and greenhouse plants.

**Amateurs.**—In the class for the cut blooms were very fair considering the conditions under which they were raised and the backward season. Dahlias were poor and nothing like what is generally found at this show; the Stocks, Pansies, and Roses were, however, very good, and the Carnations were well marked though scarcely so good as they would have been with finer weather.

**Nurserymen.**—In this division the judges had some difficulty in deciding who had the best selection of blooms of Tea Roses, Messrs. D. & W. Croll, Dundee, and Messrs. Cocker & Son, Aberdeen, being the only competitors. Both had good displays, but the 1st prize fell to the latter. Among his flowers Grace Darling and Vicomtesse Folkestone were particularly noticeable. Messrs. Croll's included fine blooms of Madame Lambert, Rubens, and The Bride. Messrs. Cocker also took 1st prize for H.P.'s; the blooms, however, were generally over-blown, here again, Messrs. Croll came in 2nd.

The Dahlias were a fair display in this division, and Messrs. Croll, Dundee, took 1st place.

There was a very fair display of Marigolds (varied), Asters, and Stocks, the latter being very good. Amongst the prize takers for French Marigolds and cut Roses, Mr. W. Murdock, whose exhibits were raised within the City Hospital grounds, secured a creditable position, being 1st and 3rd in each. Of the cut flowers of herbaceous plants there was a very fine show.

The table plants in pots, the 1st prize for which went to Mr. Malcolm, Montrose, were well coloured, strong and healthy. There were also, finely-bloomed specimens of Petunias, shown by Mr. Grigor, Fairfield; and Begonias by Mr. H. Hall Belhelvia.

In addition to the plants, flowers, and fruit for competition were two stands near the entrance by Messrs. B. Reid & Co. Aberdeen; and Messrs. Cocker for exhibition. On these were artistically displayed branches of Tea Roses, herbaceous plants, Pinks, and fine healthy examples of various stove and greenhouse foliage and blooming plants.

**Fruit.**—The display of fruit was a fine one. Red Currants and Strawberries were particularly good. Grapes were not so good generally, but the collection sent by Mr. W. H. Lumsden, of Balmiedie, was very fine, the largest bunch weighing 10½ lb.

The *fête*, as stated above, was favoured with beautiful weather, and in the evenings large crowds visited the grounds, the total proceeds amounting to £262 5s. 6d.

## THE WEATHER.

### THE PAST WEEK.

The following summary record of the weather for the week ending Aug. 27, is furnished from the Meteorological Office:—

"The weather has been unsettled and rainy over the western, north-western, and extreme northern parts of the kingdom, but elsewhere the conditions have been fairer, and the rainfall less heavy and frequent. Some thunder and lightning were experienced in many parts of Great Britain, as well as at a few of the Irish stations.

"The temperature has been a little above the mean in Ireland, Scotland, and the north-east of England, and about equal to it in 'England, S.W.,' and the 'Channel Islands,' but in the other English districts a slight deficit is shown. The height of the maxima, which were recorded either on the 24th or 25th, varied from 68° in 'England, N.W.,' to 74° in 'Scotland, N.,' and 75° in 'England, E.,' and 'England, S.' The lowest of the minima, which were registered on the 23rd in Scotland, and on irregular dates over England and Ireland, varied

from 45° in 'England, N.W.,' 'Ireland, S.,' and at some of the Scotch stations, to 50° in 'England, S.W.,' and to 56° in the 'Channel Islands.'

"The rainfall has been rather more than the mean over Ireland and in the north of Scotland, but less in most other districts, especially over the south of England and in the 'Channel Islands.'

"Bright sunshine shows a decided decrease over Scotland, but in most parts of England and in the south of Ireland it has been more prevalent than it was last week. The percentage of the possible amount of duration ranged from 24 to 29 in Scotland, from 34 to 47 in Ireland, and from 27 to 41 over England. In the 'Channel Islands' the percentage was 47."

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## Obituary

**PHILIP HENRY GOSSE.**—We regret to announce the death of Mr. Philip Henry Gosse, F.R.S., which occurred at his residence, St. Marychurch, Torquay, on the 23rd ult. This distinguished zoologist was born at Worcester in 1810. He went out in a mercantile capacity to Newfoundland, where he occupied his leisure in collecting insects. After a residence of eight years in Newfoundland, Mr. Gosse visited Lower Canada, where for three years he specially devoted himself to the study of zoology and entomology. He afterwards travelled through the United States, and resided for about a year in Alabama, making a large collection of drawings of insects, especially the fine lepidoptera of that region. After his return to England in 1839, Mr. Gosse published a general synopsis of his investigations, under the title of *The Canadian Naturalist* (1840). In 1844 he visited Jamaica, and spent eighteen months in the study of zoology, and issued on his return the result of his researches in *The Birds of Jamaica*, and *A Naturalist's Sojourn in Jamaica*. During the next few years he devoted himself especially to the microscopic study of the British rotifers, and took a prominent part in the formation of public and private collections of marine animals. Mr. Gosse was for many years a correspondent of this journal, and took especial interest in Orchids, of which he grew a collection. He leaves an only son, Mr. Edmund Gosse, the well-known literary critic.

## VARIORUM.

**WOUNDS OF FRUIT TREES.**—Sometimes a large limb of a tree has been broken, and must be sawn off, or severe pruning seems called for through other causes. In such cases it is important that the wound occasioned by the knife shall be protected from the damaging effects of the weather by the application of some protecting or healing substance until new wood has time to form over it. Gum shellac dissolved in alcohol is generally used for this purpose; but a more effective material can be made as follows:—Melt a pound of common resin over a slow fire, adding to it meantime an ounce of beef tallow, and stir all well together; then take from the fire, and when the whole has partly cooled mix with it a teaspoonful of spirits of turpentine, and in a few minutes stir in a few ounces of 95 per cent. alcohol. Care should be taken to prevent the alcohol taking fire, and for this reason the kettle should be moved to a distance from the stove, and on no account should this mixture ever be made in the evening, when there is a danger that a lamp may be brought near it during the process. The compound should be carefully and thoroughly stirred until it becomes a homogeneous mass of the consistency of honey. Keep it for use in a large-mouthed bottle. Then in pruning trees, or whenever they have been cut in any way, coat each wound well with this preparation. It will stop the flow of sap, and hasten the complete healing of the wound. *Mildura Irrigatorum*.

**A TRADE CENSUS.**—Mr. Myrick, at the Detroit Convention of Nurserymen, urged the preparation of a "census," or report of nursery stock, made up of reports from the different producers, which would tend to prevent over or under production in any particular line. He took the ground that growing stock should not be taxed; that there should be a comprehensive revision of fruit literature, to keep pace with the times; that great attention should be paid to nomenclature, and that proper names should be selected for new fruits; that a standing committee to co-operate with the Department of Agriculture and the State experimental stations should be appointed; that short practical papers should be made a leading feature of all meetings; that business and Association matters should not be allowed to conflict, and that to this end the exhibition hall and the meeting hall should be kept separate; and that both should not be open at the same time.

## NOTICES TO CORRESPONDENTS.

**ABIES MAGNIFICA:** *S. S.* What you send is undoubtedly *A. nobilis*. Thanks for the Sciadopioides.

**ABIES AND PICEA:** *W. J. B.* The Abies and Picea question is an old one. We follow the standard authority, Bentham and Hooker. *Plagianthus*: ask Messrs. Veitch.

**ANTS IN ORCHID-HOUSES:** *G. C.* Sprinkle their haunts with a solution of carbolic acid.

**DRIED FLOWERS, &c:** *T. D.* Apply to Messrs. Hooper & Co., Limited, Covent Garden, W.C.

**EUCHARIAS:** *A. C.* It is not uncommon for two flowers to be united.

**FERN GROWING THROUGH THE HOLE OF THE POT:** *L. C.* There was nothing remarkable in the rhizome of the Davallia creeping through the hole at the bottom.

**INSECTS:** *A. B.* Your Plums are attacked by the red grubs, or larvae, of a small blackish moth, with an eye-like spot near the tips of the fore-wings—*Tortrix* (*Carpocapsa*) *nigricana*. Shake the trees, and burn all the Plums as soon as they fall, and before the grubs escape to become chrysalids. *I. O. W.*

**JUDGING AT FLOWER SHOW:** *Secretary.* 1, Yes; 2, no.

**NAMES OF PLANTS:** *G. F. D.* 1, *Poa nemoralis*; 2, *Bromus asper*; 3, *B. giganteus*; 4, *B. tectorum*; 5, *Festuca duricula*, the glabrous specimen, and *F. arenaria*, the pubescent one; 6, *F. elatior*; 7, *Bromus commutatus* var. *Sedg.* 1, *Juncus conglomeratus*; 2, *J. glaucus*; 3, *J. maritimus*. *W. J. W.* *Jun.* 1, we cannot name without flowers; 2, *Gaultheria Shallon*. *W. P. L.* & *S.* *Scopolopendrium vulgare confertum*. *J. Robertson.* *Gongora maculata*. *G. W. H.* *Olearia Haastii*. *W. F. & Sons.* *Lycaste cruenta*. *S. C.* 1, *Ceanothus azureus*; 2, *Rhus cotinus*. *C. W. D.* *Periploca græca*. *H. P.* *Calycanthus occidentalis*. *A. B.* 1, *Tussilago Farfara*; 2, *Berteroa incana*; 3, *Ballota nigra*; 4, *Erigeron*, sps.; 5, *D. S.* *Phallus impudicus* (common Stinkhorn fungus). See Cooke's *British Fungi*. *G. B.* 1, *Adiantum Capillus-veneris* var.; 2, *Calceipellis scabra*; 3, *Pteris Adiantoides*. *P. McP.* 1, *Cryptomeria elegans*; 2, *Abies Douglasii*; 3, *Picea excelsa*; 4, *P. Morinda*; 5, *P. Menziesii*; 6, *Tsuga japonica*; 7, one of the forms of *Pinus Laricio*; 8, not found; 9, *Ailantus glandulosa*. *H. R. L.* *Spiræa confusa*. *E. R. C. K.* 1, *Echinops sphaerocarpus*; 2, *Centaurea aurea*; 3, *Eupatorium cinnabarinum*; 4, *Heuchera Richardsonii*.

**PLANT INJURIOUS TO STOCK:** *W. A.* Swine-creep (*Senebiera coronopus*). We do not think it likely this plant would be injurious. It is a cruciferous plant allied to Cress, Cabbage, &c.

**SHOOT OF SHRUB:** *W. W.* We find on your specimen traces of the former presence of greenfly and thrips, besides plenty of actual mealy-bug; and on the *Fuchsia* some caterpillar, referred to our entomological referee.

**TOMATOES DISEASED:** *H. T. Llandudno.* The tomato foliage is attacked by the now too well known and widespread mould named *Cladosporium lycopersici* (see *Gardeners' Chronicle*, November 12, 1881). The disease has several times been described in this journal. It is very probable that next year's plants will become affected if grown in the same house as the present. Better destroy infected material, and clear out and thoroughly clean the house. We do not think the slight discolorations on Rose leaves are due to fungi.

## CATALOGUES RECEIVED.

**DICKSON, BROWN & TAIT,** 43 and 45, Corporation Street, Manchester—Flowering Bulbs.

**DICKSON & ROBINSON,** 12, Old Millgate Manchester—Bulbous Roots.

**WILLIAM BULL,** 536, King's Road, Chelsea, London, S.W.—Bulbs and Tuberos-rooted Plants.

**SCOTCH & SONS,** Reading—Bulbs.

**W. CUTHBERT & SONS,** Highgate Nurseries, London, W.—Bulbous Roots.

**DICKSONS & CO.,** 1, Waterloo Place, Edinburgh, N.B.—Flower Roots.

**KENT & BRYDON,** Darlington—Bulbs, &c.

**BROWN & WILSON,** 10, Market Place, Manchester—Bulbs.

**J. CARTER & CO.,** 237 and 238, High Holborn, London, W.C.—Bulbs.

**COMMUNICATIONS RECEIVED.**—Dr. King, Calcutta. *H. W. W.*—Sir T. L. Baden Baden. *G. W. C. P. McP.* *W. T. S.*—*W. B. A. W.* *A. W. T. L. Kienast, Zurich.* *H. G. W. H. G. F. D. W. C. W. N. W.* (next week). *W. G. S. R. W. J. Bee-R. A. J. K. J. C. J. W. J. A. D. W. C. G. D. J. Y.*

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

## MARKETS.

COVENT GARDEN, August 30.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

MARKET very quiet. *James Webber, Wholesale Apple Market.*

 J. STEVENS AND CO., Cocoa-nut Fibre Merchants, Grey-  
 bound Yard, and 183, High Street, Battersea, S.W.

Protect your Fruit by using  
**MADDOCK'S KILL-WASP.**  
 Mr. C. PENNY, *Head Gardener* to H.R.H. the Prince of  
 Wales, says:—"Your Kill-Wasp is simply marvellous for its  
 quick destruction of this our greatest enemy."  
 Mr. H. H. WARD, *Head Gardener* to the Right Hon. the  
 Earl of Radnor:—"I have given it a trial, and found it to be  
 everything you represent it to be. It does its work most  
 effectively."

To be had of all Chemists, price 1s. 6d., or post-free, 1s. 9d.,  
 and from the  
**OLD ENGLISH LAVENDER WATER CO.,**  
 PULBOROUGH, SUSSEX.

**SAVE HALF THE COST.**

**GARSDIE'S**  
 BEDFORDSHIRE

 Bug, Caterpillars, &c., &c.

PERFECTLY } to the Hands and Skin, but will cure  
 HARMLESS } Ringworm in Animals, and all diseases  
 produced by parasites.

**FIR TREE OIL**  
**(SOLUBLE) INSECTICIDE**

A combination of Hydrocarbon Oils, made soluble in  
 Water, for destroying ALL INSECTS & PARASITES  
 that infest Trees and Plants, whether at the Roots or  
 on the Foliage.

Sold by Seedsmen and Chemists, 1s. 6d., 2s. 6d., & 4s. 6d.;  
 ½ gallon 7s. 6d., 1 gallon 12s., or less in large quantities.

A Treatise on FIR TREE OIL, as an INSECTICIDE.  
 Its application to Plants and Animals, sent Post free  
 on receipt of address, by the Manufacturer,

**Important Notice.**

FIR TREE OIL so well-known as an Insecticide, is  
 effectual for washing household Cotton, Linen, and  
 Woollen Fabrics, and its disinfecting, bleaching, and  
 cleansing qualities when added to water for washing pur-  
 poses, will, after the first trial, recommend itself.

No Dry Soap or any such preparations must be used  
 with Fir Tree Oil.  
 Half a wineglass-full of Fir Tree Oil to 10 gallons of  
 water for steeping, and the same quantity to an ordinary  
 size boiler for boiling, with half the usual quantity of  
 household soap, will do the work splendidly, and with  
 half the trouble.

For washing Dogs, Pigs, and other animals, half a  
 wineglass-full to a bucket of water, and used with ordi-  
 nary soap, will do better than any of the prepared soaps  
 for killing fleas, preserving the skin healthy, and making  
 the coat silky and very beautiful. One trial will be  
 conclusive.

P.S.—Paraffin Oil will mix with Fir Tree Oil in propor-  
 tion of a quarter of a pint of the former to a pint of the  
 latter, and become soluble in water.

## SPHINCTER GRIP GARDEN HOSE.

The Sphincter Grip Spring Steel Galvanised Armoured Hose is the most valuable improvement in Hose since 1840. Its lasting qualities are ten times greater than any Hose not armoured. Its complete success has caused some parties to infringe the Patents owned and controlled solely by us; and we therefore notify such that the making, vending, or use of any armoured wire-wound Hose not of our manufacture is an infringement of one or more of our several Patents, any violation of which will be promptly prosecuted. Brass plates set between the Hose and wire denote our Manufacture and the Patents.

For Price Lists and particulars of

MR. M'INTOSH, of Indenham Park, Mullingar, has been appointed Head Gardener to Lady EWART, of Glenmachan, Stranstown, Belfast.

MR. C. MUNDAY has been appointed Head Gardener to W. A. WYKEHAM MUSGRAVE, Esq., Thame Park, Thame, Oxon.

## WANT PLACES.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.  
N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

## Gardeners, Farm-Bailiffs, Foresters, &c.

**DICKSONS (Limited)** are always at hand to post a notice to RECOMMENDATION, of the highest respectability, and thoroughly practical at their business. All particulars on application.

**HOLLOWAY'S PILLS.—**Health or Wealth. —No sane person would hesitate an instant in the choice between these two conditions. Now is the season to secure the former either by restoring or confirming it. These Pills expel all impurities from the system which logs, foul vapours, and variable temperatures engender during winter; this medicine also acts most wholesomely upon the skin by disgoring the liver of its accumulated bile, and by exciting the kidneys to more energetic action. Its direct effect is to increase the strengthens the digestive process. The stomach and liver, with which most disorders originate, are fully under the control of this regenerative Pill, which acts very kindly yet more efficiently on the tenderest bowels.

# THOMAS GREEN & SON, LIMITED,

SMITHFIELD IRONWORKS, LEEDS, AND SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

## HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.  
**SADDLE BOILERS,** With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.  
*The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.*  
 These Patterns secured the **FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.**

### The Best Boiler Extant.

The longitudinal section gives a view of the fire-box, water space, flues, &c.

The front elevation shows it set in brickwork, which is necessary for this class of boiler.

The cross section gives a view of the fire-box, water space and V-shaped back.

## TESTIMONIALS.

MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

**RE HEATING APPARATUS.** Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.  
 GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.  
 The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.  
 Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.  
 I am, Gentlemen, yours truly,  
 THOS. HEWSON, Borough Engineer.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5,000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.  
 Yours faithfully,  
 (Signed) G. W. BASHFORD.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

# SPECIAL.

## HUGH LOW & CO.

Specially call the attention of their friends to the very varied and enormous Stock of both Indoor and Outdoor Plants and Trees growing in their Nurseries at Clapton and Bush Hill Park, earnestly inviting inspection of the same. When time is limited three and a half hours will suffice for a flying visit to both Nurseries, by taking the trains (very frequent) from Liverpool Street Station of Great Eastern Railway to Bush Hill Park Station, returning on same line to Stoke Newington Station, which is ten minutes' walk from Clapton Nursery.

CLAPTON NURSERY, LONDON, E.

A NEW VEGETABLE!

A DELICIOUS SALAD!!

A New Delicious Vegetable and Salad Combined.

### "SHANTUNG CABBAGE."

Cos Lettuce Shaped—Grows Anywhere—Only Requires Tying up like Cos Lettuce.

READ Mr. GEO. HUGHES' report as late Commissioner at Chaco, in the *Kean Bulletin*, also *Gardener's Chronicle* of last May (p. 619), where he states:—"Eaten Raw, in a Salad, it is so delicious a Flavour that I know of no Vegetable in England to approach it." When boiled the flavour and character becomes altered, and it is enjoyable as a delicious and welcome change to Seakale, Asparagus, Greens, &c.

For further particulars see LIST of SPECIALTIES, Gratis and Post-free. Price, 3s. 6d. and 5s. 6d. per packet; or, 25 seeds for 1s. 1d., post-free.

CREWS, COX & CO.,

SEED AND NURSERY ESTABLISHMENTS,  
GLOUCESTER.

The Best Present for a Gardener.

## VINES and VINE CULTURE.

The most complete and exhaustive Treatise on Grapes and their Culture ever published.

New Edition.

Price 5s., post-free 5s. 6d.

A. F. BARRON, Royal Horticultural Society, Chiswick.

**80,000 CLEMATIS**, in Pots, of all the finest Double and Single Varieties (some of the flowers of which become 10 inches across, and are of every shade, from pure white to the darkest purple), for climbing and bedding, from 12s. to 24s. per dozen, strong plants; extra strong plants, reported into 5½-inch pots, 2s. 6d. each; Beauty of Worcester, a magnificent purple, excellent for bedding, recently sent out by us, reduced price 2s. 6d. each. Descriptive LIST on application.—RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

Palms, clean and healthy.

**WILLIAM ICKTON** has a very extensive stock of all the leading kinds, in fine condition; 50 houses being devoted to their growth, many being fit for exhibition of the following varieties:—*Arce lutea*, *Cocco flexuosus* and *Weddelliana*, Kentias of all kinds; *Seneciotheca elegans*, *Latania borbonica*, *Phoenix reclinata*, *rupicola*; also a very large assortment of Palms in 6's, 8's, and 12's for table. Inspection invited.—Putney Park Lane, S.W., and 129 and 130, Flower Market, Covent Garden, W.C.

## IMPORTANT!

OUR CATALOGUE of "ALL WANTS FOR THE GARDEN" during the Autumn and Winter is the most complete, going more direct to the point in supplying everything that the most ardent lover of flowers delights to have than any other, simply because it is our speciality, consequently supply nearly all enthusiastic amateurs, who have the very best. We produce and manufacture nearly everything we offer, and immediately deliver to everybody's door all over the World, without the slightest fear of either being inferior or over-charged.

**H. CANNELL & SONS,**

E. COLLINS AND SONS, Cumberland Park Nurseries, Willenden Junction, N.W.

**FOR SALE**, in one lot or in pairs, Eight large ORANGE and one LEMON TREE, varying from 6 to 10 feet high, well furnished, healthy, and vigorous. Established in suitable square portable boxes.—For particulars, apply to EDW. TILLEY, Bathwick Nurseries, Bath.

**150,000 MAY LILY ROOTS**, genuine Berlin, large bulbs variety. First quality. Supplied by the end of November.

FR. JOHN, Mayflowers Grower and Nurseryman, Dessau, Anhalt, Germany.

**H. B. MAY'S SPECIALTIES.**

**FERNS.**  
All the leading and most useful sorts; immense quantities in various sizes; also many new and rare species and varieties.

**TREE CARNATIONS.**  
Including Mdlle. Carle, A. Alegatière, Miss Joliffe, Dr. Raymond, Andalusia, Lucifer, and all the best sorts. The plants are unusually fine this season.

**CROTONS.**  
A great variety, all beautifully coloured.

**CLEMATIS.**  
A fine stock of all the best sorts.

**IVIES.**  
*Madrensis variegata*, Lee's New Silver, rhomboides obovata, and other popular sorts.

**PRIMULAS, DOUBLE WHITE.**  
An immense stock; plants very healthy and vigorous. Special low prices to the Trade. An inspection respectfully invited.

H. B. MAY, Dyson's Lane Nursery, Upper Edmonton. Stations: Angel Road and Silver Street, G.E.R.

# BULBS

FOR OUT & INDOOR CULTURE.

Large Collections of all the very Best Varieties of HYACINTHS, TULIPS, CROCUSES, NARCISSI, LILIES, SNOWDROPS, &c.

Only the very best kept in stock.

Prices extremely moderate.

Illustrated Descriptive Catalogue (No. 345) POST FREE ON APPLICATION.

**Dicksons**  
(Limited)  
The Royal Nurseries & Seed Establishments,  
**Chester.**

**WALLFLOWER**—A variegated-leaf fine Plant for Sale.  
S. ROWLAND, Cranleigh, Surrey.

## STRAWBERRIES.

Strong Roots, 4s. per 100. Plants in small pots, 16s. per 100; ditto in large pots, 25s. per 100. Descriptive LIST free.

**JERSEY FRUIT TREES AND ROSES.**  
Carriage Paid. Strong healthy trees, the finest that money can buy. Roses wonderfully cheap. Cordons a speciality. Before ordering be sure to write for our Illustrated CATALOGUES.

JOSHUA LE CORNU AND SON, High View Nurseries, Worcester.

## ALL IN POTS

For Immediate Planting.

Clematis, in variety	Pyraeantha
Ivies, do.	Garrya elliptica
Honeysuckles, do.	Fyrus japonica
Wisterias	" nivalis
Brambles, pink and white bark	Virginian Creeper
Hops	" Veitchii
Spanish Gorse	Lonicera flexuosa

CHARLES NOBLE, Bagshot.

## "ONLY THE BEST."

### CHEAP BULBS FOR FORCING, &c.

ROMAN HYACINTHS	Per 100—2s. 6d.
DOUBLE ROMAN NARCISSUS	15 0
PAPER WHITE NARCISSUS	8 0
VAN THOL TULIPS	7 0
SECOND-SIZE NAMED HYACINTHS for forcing, our own selection, assorted colours	21 0
UNNAMED HYACINTHS for bedding	16 6

15 per cent. discount, cash with order. Carriage paid. NAMED HYACINTHS, best quality, equally cheap.

**GARAWAY CO.,**  
DURHAM DOWN, CLIFTON,  
BRISTOL.

## FERNS A SPECIALTY.

The largest, most complete, and profusely ILLUSTRATED CATALOGUE OF FERNS ever published, containing over 120 illustrations, and much valuable practical information on the cultivation of Ferns, &c. 1s. 6d. post-free. Smaller Catalogue of over 1300 species and varieties free on application.

**W. & J. BIRKENHEAD,**  
FERN NURSERY, SALE, MANCHESTER.

## DUTCH BULBS CHEAP!

### FRENCH BULBS CHEAP!

### ENGLISH BULBS CHEAP!

SEE OUR  
*Special Wholesale Catalogue of Bulbs*,  
Containing LIST of all the best varieties of HYACINTHS, TULIPS, CROCUS, LILiums, DAFFODILS, SNOWDROPS, IRIS, &c., free on application.

Please compare our Prices before sending your Orders abroad.

**WATKINS & SIMPSON,**  
SEED AND BULB MERCHANTS,  
EXETER STREET, STRAND, LONDON, W.C.

60s. per acre, while orchard land was worth £4 to £10, showed that owners who screened themselves behind their legal rights were not only the enemies of the people, but also their own. Small fruit farms had become deservedly popular in the most prosperous States of America.

Mr. W. F. Emptage, of Hawtswick, St. Albans, read a paper on "Fruits Suitable for the District for Market Purposes." After describing the qualities of the land in the locality, he said that some of this land would pay better with fruit than with Wheat, but with this condition—that the soil must not be trenched. Trenching frequently occasioned "canker" of the soil. On the riversides of the Ver, Lea, and Colne, he ventured to assert, there was some of the finest land in the world, but it was mostly covered with grass. Those who, a few years ago, persuaded the farmer to lay down grass had done more to promote agricultural depression than any foreign competition. It had drawn the labourer from the land; and he was rather glad the past season had been so bad, because it would give the quietus to the laying down of good land to grass. The land was now bound down by cursed laws, and held by hands which did little for their fellow beings. A better state of things might be brought about by the better cultivation of the land. In the growing of fruit lay England's salvation. He considered that a greater production of the Grape would prevent much excessive drinking, and they might be grown so as to be supplied to the poor man, and made to pay, at 4d. per pound, and then pay better than Wheat. He spoke thus after having made experiments in Grape production in Herts. They need not let foreigners supply all our fruit. In conclusion, he would recommend the early system of cultivation combined with the system of irrigation discovered by the Hon. A. N. Cole, of Wellsville, U.S.A., which adopted, the land of England and Ireland would support in comfort their populations—indeed, would amply support that population if doubled.

Mr. E. Hobday, of Ramsey, Huntingdonshire, in a paper on "Fruit Planting in Relation to Land Tenure," considered that the main cause of our neglected fruit gardens was that the land was bound up in "fettors forged in a narrow-minded past," and to make the land productive to its fullest extent it must be absolutely free. Fruit growers should feel assured that it would be possible for them to become owners of their own freeholds; and no impracticable conditions should be imposed on tenants which were likely to hamper industry. He referred to the baneful effects of the extraordinary tithes and ancient manorial exactions. Mr. Hobday condemned the former practice of growing numerous varieties, and said that beyond selecting good stocks it was necessary to judge of what would best suit a locality before planting, and to well consider the capabilities of the land. He hoped that the English markets would soon be filled with home-grown fruit.

Among other papers read was one by Mr. Joseph Cheal, of Crawley, Sussex, on "Apple and Pear Culture," which he regarded in the light of the proverb "He that plants Pears, plants for his heirs." He dwelt in detail upon the "Cordon" system of culture, recently adopted in this country, and signifying practically the planting of fruit trees in extended lines. "He had witnessed the remarkable success of this system in the Channel Islands. Gardeners had been slow to recognise its advantages, but the want of success complained of in some quarters could be traced to a false start in some important particular, or to the want of knowledge as the proper pruning and treatment.

At the close of the Conference resolutions were passed protesting against the tolls exacted at Covent Garden and provincial markets; protesting against the practice of the Royal Horticultural Society in granting First-class Certificates to comparatively worthless fruits; and calling upon the Legislature to appoint a Royal Commission to enquire into the present system of tenure of labourers' allotments, and the question of improved systems of culture. A special resolution was also passed against the railway rates charged to horticulturists.

#### MARKETING FRUIT.

*Apocryphal* of the above important subject, we reprint a letter which appeared in the *Gloucester Journal* of September 1:—

"Much has lately been said and written upon the better utilisation of our crops of fruit, and it all tends to show how far Englishmen are behind other countries in preserving and packing fruit. The present method of disposing of our fruit is more worthy of the rough and ready times fifty years ago than of the present day, when science and skill have done so much to enlighten us. What are the facts? In England, when we get an abundant crop of fruit (take Plums as an instance), the few first pots usually sell well; but the markets soon become so completely glutted that salesmen sometimes have a difficulty in selling for a sufficient sum to pay the carriage, and the grower gets only a trifle, or perhaps nothing, for picking and packing; consequently many tons are often left to rot when the crop is very heavy. As soon as the main crop is gone, the few very late Plums usually fetch good prices, thereby proving that there is always a fair consumptive demand; therefore if, instead of glutting our markets when the main crop is ripe, we could utilise a portion by drying, &c., we should secure better prices for the remainder; and then we should have the dried and preserved fruit for use in winter and spring, instead of purchasing these from other countries. Owing to the climate it would probably be impossible for us to produce dried and crystallised fruit equal to that which we import from France, &c.; but, surely we might produce an article which would command a ready sale at a reasonable price; as the dried and crystallised plums which we import are sold at prices which place them entirely beyond the reach of the majority of our population. It certainly appears an absurd policy to feed our people with home-grown fruit only during the time it will keep in its raw state, and import what is required for the remainder of the year; and this, while we throw away the raw material which, with proper treatment, would produce a similar article to that imported. Also with the harder fruit (Apples and Pears) much might be done in drying for spring and summer use, and cheap jam might be made, which would be a boon to the mass of the people, and thus, in a time of plenty, prevent the present waste and the flooding of the country with wretched cider and perry.

"Packing also is a matter in which we are far behind. Smaller packages might be used with very great advantage, and the best fruit would sell much better in small boxes, which could be made very cheaply. These should be branded with the packer's name, thereby insuring to the purchaser a guarantee that the fruit would be as good throughout the box as on the top. After this system had been adopted for a little time those who packed really good fruit would soon find their labours amply rewarded. Very much more could be said upon making fruit more profitable, but some practical experience of drying, preserving and packing would be much more instructive than volumes of written arguments. There appears to be a move throughout the country in this very important matter, and the Gloucestershire Root, Fruit and Grain Society are well to the front, as they are offering through the kindly aid of two country gentlemen several prizes of considerable value for essays

upon this subject and for dried and preserved fruit in various forms, to be competed for at their show in November. Those who would like to compete for these prizes, and, in fact, any interested in fruit, would do well to write to the secretary of the society—Mr. T. H. Phelps, Tibberton, near Gloucester, who will forward a schedule which fully explains the prizes offered."

## THE FERNERY.

#### LASTREAS.

This genus includes many very pretty species, which deserve better attention than they usually get; as they are chiefly hardy, or nearly so, they do not meet with such good treatment as those that require a higher temperature. The deciduous sorts—some of which are very pretty—often suffer much through being neglected after they have lost their fronds, and, consequently, when they start into fresh growth in the spring, the fronds are attenuated and deformed. To keep the plants in good condition through the winter, a little protection is necessary. Even for the hardy sorts when grown in pots, and they all require just enough moisture to keep the roots in good condition; and as soon as the first sign of activity is discernible they require to be brought into a light cool position. It is one of the greatest faults connected with Fern-growing to keep them in dark over-shaded positions. Of course, plants started under these conditions will not bear exposure afterwards, unless great care is taken in hardening them off; but start them in full daylight, and they will withstand a great amount of sunshine, provided proper attention be paid to watering; and plants so treated are not only more beautiful, but more serviceable as well.

Most of the Lastreas are of rather slow growth, especially in a young state, and generally the spores are longer in starting into growth than is the case in many other Ferns, and they are consequently liable to be over-grown by other sorts which spring up as weeds. I saw an instance of this not long since. *Lastrea erythrosora* had been sown, and a good number of young seedlings were pricked off, but these turned out to be *Pteris*; however, the seed-pot was stood by, and later on a good crop of the right sort came up.

In growing Lastreas the chief thing is to keep them clean. Thrips are particularly partial to most of the species. It seems almost impossible to keep them perfectly clean, but a good deal may be done by keeping all the old fronds removed, always avoiding a dry, arid atmosphere, and using as little artificial heat as possible. The plants should never be disturbed at the root, except when they are in active growth, and they may be repotted two or three times during the season, if it is desired that they should make as much growth as possible. Any ordinary compost will suit them, but peat should be used very sparingly. Like many other Ferns they thrive much better in good loamy soil than where much peat is used. Of the numerous species and varieties the following are among the most useful:—

*L. aristata variegata*.—This is one of the prettiest, and perhaps the most useful of the genus. The fronds are of good substance, with a bright green surface, relieved by a linear marking of pale green. Although this comes from Japan, and is nearly hardy, it succeeds best in a higher temperature, and to form useful specimens two or three should be grown in the same pot.

*L. patens*.—A very elegant Fern, with gracefully arching fronds of a pale green; this forms a very pretty plant for table decoration. To grow this successfully the plants must have plenty of room, as, if the fronds come in contact with each other, they get deformed, and do not attain a symmetrical outline; but if the plants are stood upon inverted pots, and receive favourable treatment, they form very handsome specimens.

*L. erythrosora* is another very useful Fern for decorative purposes. In a young state the fronds have a bright reddish-brown tint, which changes

with age to deep green; the fructification also is very pretty, the coverings of the spore-cases having a bright rosy tint. Although a deciduous species, it is well worthy of a place in every collection, and is a very useful decorative Fern for summer use.

*L. decomposita* is another very pretty species, with broad finely-cut fronds.

*L. Standishii*, *L. flabellata*, *L. opaca*, *L. atrata*, and *L. Sieboldii*, are all useful greenhouse Ferns. I should not omit the prettily tasselled *L. Richardii* multifida, which should be tassel in a stove temperature; and *L. cristata*, a very pretty fern form, very regularly tasselled at the extremities of the side-pinnæ, and the fronds terminating with a heavier crest. *Pteris*.

## PLANT NOTES.

### IRIS DICHOTOMA.

THIS curious species is now flowering in the herbaceous grounds at Kew, and though not in any way to be compared with the numerous garden varieties in cultivation now, it is a very remarkable plant, distinct from any other *Iris* grown, both in habit and flowers. It is figured in the *Botanical Register*, t. 246, Sweet's *Brit. Fl. Garden*, t. 96, and shortly since in the *Bot. Mag.* The figure in the latter work gives the flowers as bright purple, and the description says rather small. In the plant flowering at Kew the standards are pale satiny-white, with just a trace of purple, chequered with brown spots or bars towards the base; the falls are much the same, with the exception of a few scattered purple spots, densely purple spotted or barred from half their length to the base. The flowers are over 2 inches in diameter, from fifty to seventy on each plant, and rarely more than two or three open at a time, and that always towards evening. It has a very much branched habit, throwing flowering branches from all the upper leaves, and these again branched or forked. It seems to have been long in cultivation, but is apparently rare, and probably not more than a biennial. The Kew plants were raised from seed kept in a cold frame during winter. It is not hardy in the open air. *D.*

### IRIS ROBINSONII.

A plant of *Iris* (or *Morea*) *Robinsonii*, given to T. A. S. Dorrien Smith, Esq., by H. J. Elwes, Esq., some six years ago, is now in flower in these gardens. It is a native of Lord Howe's Island, and Mr. Elwes says that it has never flowered in Europe before. It also flowered here in 1887. The plant is in vigorous health, the flower-spike about 5 feet in height, and there have been some sixty flowers on it, which are of a large size, and white. The plant is growing in a border only a few feet from the edge of the lake. *G. D. Vallance, Tresco Abbey Gardens, Isles of Scilly Sept. 3.*

### LAGESTROEMIA INDICA.

According to some writers this is said to be one of the most beautiful of flowering plants in the gardens of India. However this may be, we can say that it is one of the handsomest of plants to be found now in bloom under glass, and it certainly deserves a place in every garden where room can be provided for its accommodation. The *Bot. Mag.* (t. 405), says of it:—"The flowers are produced in panicles or trusses at the end of young shoots of the current year, from 3 to 8½ inches long, and from 6 inches at the base, to 3 inches in diameter. Upon the first opening of the flower it is seen to greatest advantage as the glittering golden-yellow of the stamens makes a dazzling contrast with the richly coloured petals, which are beautifully formed, the limb being gracefully waved and curled, and connected to the inside of the segment of the calyx by a longish narrow claw." Its height is about 10 feet, and it thrives in a house where the temperature never reaches lower than 40° to 45°. It can be grown into good specimens by pot culture, but is seen more to perfection when planted out in a well drained situation, the compost being made up

of strong fibrous loam with some peat and sand mixed with it. In the beginning of the year it should be pruned in rather closely. It may be readily propagated from the young growths if these are taken off when an inch or two long. Our plants always receive plenty of water at the roots, no attempt being made to dry them off; the main thing is to keep the temperature low enough so as not to excite them into growth during the winter months. The genus is not a large one, and only a couple or so of species are in cultivation. There is a white form, *L. indica alba*, which is well worth cultivating. *L. flos-regina* has been termed one of the most beautiful of flowering plants in the world. This attains the height of from 50 to 60 feet. *W. Harrow, Botanic Garden, Cambridge.*

## THE BULB GARDEN.

### LIFTING AND STORING NARCISSUS BULBS.

WRITING in these pages a week or two ago, Mr. James Walker stated that drying, or, rather, cleaning and storing, *Narcissus* bulbs was an advantage to them, adding that such bulbs would be found to have made stronger and deeper roots in October than those of other bulbs not so cleaned and dried. Now, on p. 189 we have Mr. Dod's experience, that dried bulbs of *N. Bernardii* are with him soft and rotten, or likely to become so when replanted, while bulbs of the same kind left in the soil are perfectly sound and firmly rooted. I have always looked on the storing of *Daffodil* roots as a necessary evil on the part of nurserymen and professional bulb growers, but one which the amateur would do well to avoid. Mr. Walker is such a noted cultivator of these flowers, and so honest and high-minded in his public statements, that his advice is apt to be followed—*longo intervallo*—by many; and I note that "R. D." (p. 180), in writing on "The Florist's Tulip," also follows Mr. Walker in stating that "the bulb which has been kept cool and dry strikes root with far greater force at its natural time for rooting, which is about the month of September." And yet we are told that November 9 is the traditional time for planting Tulips. But even supposing that the dried bulbs of *Narcissi* (or of Tulips, as in "R. D.'s" case) do "strike root with greater force," I fail to grasp that fact alone as a gain in any way. I have never yet heard a physiologist assert that a man or an animal is the better for being deprived of their food past the natural limits of meal-times, even although the tendency generally is to make them eat more "forcibly" in the natural anxiety to make up for lost time. The fact is, that neither animals nor plants are permanently benefited by being starved when they ought to be eating in the one case, or rooting and growing in the other.

The only real point of difference in *Narcissus* culture between myself and Mr. Walker is this question of drying, cleaning, and storing the bulbs. It may be that soil and climate cause me to hold to one view, and he to the other. The soil I should select in which to grow the bulk of *Daffodils* to perfection would be "a meadow to which manure of any kind had been a foreigner for many years," such as Mr. E. Jenkins describes at p. 189. On such a soil bulbs can scarcely require much cleaning, I should say, after being dug in dry weather in July or August.

I see Mr. Jenkins approves, and, as I think, rightly, if any be used, of cow manure. Cow manure is largely used in the light deep sandy soils in Holland, and yet, if I am not mistaken, Messrs. Roozen & Son in their newly published book on the *Cultivation of Bulbs*, make a point of "not cow manure" in their note on the culture of *Narcissus*. If this is so, I should like to ask those noted growers why they place a ban on cow manure, as opposed to other stimulants?

I at once admit that an increase of size and weight is the result of using manure in *Narcissus* culture, but at the same time I should be very sorry to take

it for granted that large and heavy bulbs as so produced were better, all things considered, than are equally large and heavy bulbs producible on deep, rich meadow loams, over gravel (*i.e.*, well drained) and not manured. Indeed, I will go further, and if needs be, prove by examples that the largest of manured *Narcissus* roots or bulbs do not necessarily flower better than medium-sized bulbs grown without manure on a suitable soil. That manured roots are very prone to disease is a well-known fact. The finest flowers of N. *Horsfieldii*, N. *Sir Watkin*, N. *Emperor*, and many other kinds grown here are, I find, not the produce of the very large and heavy "mother or breeder roots," but of medium-sized, solid, and well-ripened globular bulbs before they reach or attain to the breeder stage.

The present season has been so constantly wet and half that the bulbs sent out new roots were the leaves had entirely died away, and amateurs will, I think, be wise in deferring the lifting the bulk of their *Daffodils* until next season. As to deep or shallow planting much must depend on the subsoil below. On well drained, gravelly sub-strata, deep planting, and on soils water-logged, or moist below, shallow planting would be most likely to succeed. In the latter cases, raised beds with ample drainage (*i.e.*, deep alleys) between them, would be an advantage. There cannot possibly be any question as to the benefit attending annual replanting in ordinary seasons on all soils where leaves and roots die off simultaneously. The new roots strike out into fresh soil, and obtain a good form, level quality, and a vigour not attainable in any other way. It is the Dutch plan, and is, as I think, the plan for nursery or trade growers in England, and the amateur should at once adopt it in the case of any tender varieties, such as *N. pallidus præcox*, *N. moschatii*, of the Pyrenees, *N. variegatus*, or others that do not succeed on the replanting every two or three years system. I have always protested against the drying or storing of *Daffodil* roots in any shape or form. To the trade it is a necessary evil, and even they as growers are now waking up to the fact that early-planted *Narcissi* are the best. It cannot be too strongly or earnestly enforced that the present is the time to plant *Daffodil* roots, or to pot them for indoor culture, and every bulb dried and tossed about in shed or shop until November or even later cannot be expected to flower anything like so strongly or so well as they will if planted now. Amateurs fond of *Daffodils* should insist on August, or at the very latest, September delivery.

There is a little point in Mr. Dod's note at p. 189 which is rather puzzling to me. It is there stated, "As long as the soil is wet the root-action remains active, even after the leaves are quite dead, and enables the bulb to get rid of its superfluous moisture into the soil. It may be so, but after the leaves are dead, I fail to see how evaporation or transpiration can take place through the bulb tunics when they are surrounded by wet soil. My notion is that they do not attract any superfluous moisture after the leaves are withered and fallen. All superfluous moisture, if any, imbibed by the roots before the leaves decay is by them (the leaves) drawn off and returned to the atmosphere in the usual course of transpiration. It is this continued labour being forced upon them (owing to a prolonged season of rain and little sunshine) which has led to the leaves being now, in many cases, as fresh and as green as in April, when last year they had all died clean away by June.

To sum up, my advice to amateurs is as follows:—Plant early, *i.e.*, in August if possible, but not later than September. On dry sandy, or even on deep loamy soils, if well drained, plant deeply, say 6–8, or, on very light soils, 12 inches deep. Use no manures, but replant on fresh land a year or two after it has been manured for other crops. Replant a third of the entire stock every year, just as the leaves die away. On strong, damp soils plant shallow, 2–3–4 inches deep only. On wet subsoils plant on raised beds well drained below, planting

shallow and in the most sunny positions. Delicate sorts should be replanted in fresh soil every year, in July or August. Burnt earth and sea sand are valuable for dressing the soil in which Narcissi are grown, and on wet soils the bulbs should be covered with sand when planted. *F. W. Burbidge.*

## NEW OR NOTEWORTHY PLANTS.

### PENTSTEMON ROTUNDIFOLIUS (*A. Gray*), (Fig. 31) *n. sp.\**

This very distinct species is entirely new to science, and is certainly one of the most important novelties of 1888. Its introduction to our gardens is due to the untiring efforts of Mr. W. Thompson, of Ipswich, whose name has long been identified with the plants of Texas, Mexico, and other North American States. The present plant has flowered with such profusion this year, in spite of the very uncongenial weather, and the flowers withal are so pretty and graceful, that it has only to be known to become a general favourite. Its nearest ally, among those in cultivation at least, is *P. centranthifolius* (Chelone) of the *Botanical Register*, vol. xx, p. 1739. The latter was sent from California by David Douglas, and is described by Benth in the *Proceedings of the Royal Horticultural Society*, vol. i., as *Chelone*. It is perfectly hardy, growing well in any good garden soil if fully exposed to the sun. It differs abundantly from the present species in longish ovate lanceolate Valerian-like leaves, and glabrous flowers. In *P. rotundifolius* (see fig. 31) the leaves are coriaceous, orbiculate, entire, the lower ones on longish petioles, those on the stem clasping, the whole conspicuously glaucous. The flower-stem, 2 feet in height, is very graceful, producing abundance of medium-sized brick-red flowers, with pale yellowish throat, anthers slightly exserted, the same length as the style. It has flowered at Kew all through the summer and autumn months. The plants were collected by Mr. Pringle in the State of Chihuahua, Mexico, in the summer and autumn of 1886, and described by Dr. Gray in the *Proceedings of the American Academy of Arts and Sciences*, vol. xxii., p. 307, 1887. In a note attached to the description, Mr. Pringle says he collected it at Mapula, Potrero, and other mountains near Chihuahua, hanging from seams of cliffs, long enduring, apparently flowering for most of the year. The plant may be seen at the present time in the new alpine-house at Kew. *D. Dewar.*

### CATLEYA HARRISONIANA (*Bateman*) VAR. *REGNIERIAN*, *n. var.*

The rather short sepals and petals show such a wonderfully clear, warm purple tint as I never saw in the affinity. The lip's side lacinia are light purple outside, yellow in the mid line. The inside is light yellow, with darker keels and a light purple border to the side-lacinia. The mid-lacinia is very deeply plaited and minutely crenulate, and the whole lacinia stands upright and hides the top of the column. It is whitish-yellow, with an orange callosus basilar disc, and washed with purple outside. Column white, with a greenish base. This lovely thing was kindly sent me by M. A. Regnier, Fontenay-sous-Bois, Seine, and whose name it may justly bear. *H. G. Rehb. f.*

### LELIA XANTHINA (*Lindl.*) *AGRAPHIS*, *n. var.*

With this species have always appeared specimens without any purple markings on the lip. It has also been sent me lately through my kind corre-

spondent, Mr. B. S. Williams, from Mr. Wischusen of Wood Green, N., who desired for a distinct variety a separate name, as is the custom now-a-days. The first-named gentleman appears to be very successful in growing this tribe. I shall have the pleasure to write shortly about a *Cattleyoid* sent by the same gentleman. *H. G. Rehb. f.*

### CYPRIPEDIUM CONCOLOR (*Parish*), VAR. *SULPHURINUM*, *n. var.*

—This is stated to be green-leaved. It is a lovely elegant variety, with light sulphur-coloured flowers, without the least trace of a spot. There are only two darker yellow eyes on the disc of the triangular, heart-shaped, very acute staminode. The petals are bent down with much elegance. It was kindly sent me by Messrs. Hugh Low & Co., Clapton. *H. G. Rehb. f.*

### CYPRIPEDIUM PAGEANUM, *n. hybr.* (*Gall.*)

This is stated to be the result of crossing *Cypripedium superbiens* (Veitchianum) and *C. Hookeri* (Hookeri of many gardeners). The leaves are nearly glaucous, with dark reticulations. The red hairy peduncle is one-flowered. Bract half as long as the ovary, spatheaceous, acute, reddish at the base. Upper sepal elliptical acute, with twenty-three green veins, a few of which are reddish at the apex. Lower sepals much smaller, not equalling half the lip, oblong acute, with green veins, two of which are red at the apex. Petals deflexed, ligulate acute, ciliate, with green veins on a whitish ground that turns in the light to a reddish colour in the anterior third. There are numerous Indian-purple spots on the basilar and median portions. Lip in the way of that of *Cypripedium superbiens*, but narrower, two-horned at the mouth of the sac, dark brown, ochre in the mid-line. Staminode transverse, with two inflexed horns and a small apiculus light green, with the usual dark reticulation in the middle.

It was raised by Mr. Page, an ardent orchidist, at Bougival, near Paris, and whose name it duly bears. I had it through the kindness of Messrs. Seeger & Tropp. *H. G. Rehb. f.*

## FLORISTS' FLOWERS.

### AUTUMN BLOOM OF AURICULAS.

I THINK it not unlikely there will be, as one of the results of the moist cool June and July, a good deal of autumn bloom\* from Auriculas. The plants appear to have made, under the favourable condition of coolness, a continuous summer growth, and the crowns are plump, green, and full of life. I am keeping my own plants pretty dry at the roots, at the same time not allowing them to flag in any way, as I think this is disastrous in its effects. I am potting later than usual, in the hope thus to check autumn blooming. Seedlings have grown vigorously—the strongest are beginning to bloom. By doing this in the autumn it enables one to throw out all the inferior types. Anything promising should be marked, and the test of spring flowering applied. I find that the autumn promise and character is occasionally reversed when the spring bloom is put on. But a second year's flowering should be tried before any thing of promise is finally rejected. *R. D.*

### THE PINK.

The laced varieties are not grown quite so much as they used to be a quarter of a century ago, when Pink shows were popular. It is a distinct border plant. There are not many raisers of seedlings now, but Messrs. Hooper & Co., of Bath, have raised some very distinct varieties, of which they sent blooms a few weeks ago. One of them had flowers as large as those of a Carnation. They were well laced and distinct in colour, and this is saying a good deal, for Pinks have but little variety amongst them. The young plants propagated from pipings put in about the end of June should now be well rooted, and they ought to be planted out in the beds or borders where

they are to flower as soon as the ground can be prepared for them and they are strong enough. If the plants are small 9 inches apart is a good distance; large plants may be allowed a foot each way. It is a good plan to have the plants well established before the winter, as they will throw up stronger flower-stems the following season. They like rich soil, not too heavy. In fact, they are not so fastidious as their near ally, the Carnation, and will succeed admirably in any ordinary garden soil. The plants are strong enough to plant out about the middle or end of September.

### THE FORCING PINK.

Varieties of this section are more readily propagated than those of the laced type. I think very highly of the pure white variety with prettily-fringed flowers, grown by the acre in the fields round about here to supply cut flowers for the London market. The plants are torn into pieces by the hand, and planted in rows in a rough-and-ready manner on ploughed ground. This variety has a very sweet Clove-like scent. For forcing and garden culture I like the more delicately-constituted *Lady Blanche*. It has pure white well-formed flowers, and is admirably adapted for forcing purposes. I have not yet seen any of the purple-coloured varieties to surpass *Lord Lyons*. The flowers are rich in colour, and, like *Lady Blanche*, they have long pods that do not burst with the opening flowers. To obtain good-flowering clumps, the cuttings of these should be put, during the months of April and May, in a forcing-house or hotbed. When well rooted, they may be planted out a foot or more apart in the open garden, and, if they are intended for forcing purposes, must be planted out in light rich soil to increase in size and vigour during the summer and early autumn months. About the first week in October they may be lifted, with plenty of roots attached, and be potted into 6 or 7-inch pots, according to the vigour of the plants. *J. Douglas, Wford.*

### CARNATIONS ADMIRAL CURZON AND SARAH PAYNE.

It is sometimes said, but not always with reason, that the continual propagation of any one variety of florists' flowers has an inevitable tendency to wear it out and cause deterioration. This has frequently been stated of the Carnation, and because the florist grows his plants in pots in cold frames during the winter rather than expose them to all the rigours of the winter in the open air, he is accused of making a hothouse plant of it, and inevitable weakness and decay are asserted as taking place. This statement is always made without due consideration. At the exhibition of the National Carnation and Picotee Society, held in the Drill Hall in connection with the meeting of the Royal Horticultural Society on July 24, two flowers were exhibited—one, *Escom's Admiral Curzon*, scarlet bizarre, sent out forty-three years ago; and Ward's *Sarah Payne*, pink and purple bizarre, sent out forty-one years ago. If the statement made at the commencement of this paper is correct these two varieties, debilitated beyond measure by hard propagation during this long period, ought to have disappeared from cultivation years ago. But they are grown and shown to-day as vigorously and of as fine quality as they were over forty years ago.

Admiral Curzon is still pretty well at the head of its class, and although its supremacy may be challenged by *Dodwell's Fred*, *Dodwell's George*, *Barlow's Robert Houlgrave*, and *Dodwell's Robert Lord*, it will yet be grown and exhibited for years to come. In the second edition of his book on the Carnation Mr. *Dodwell* states that "It is pleasant to record the Admiral is yet alive to us and worthy of admiration, as in the days of its earliest youth. Wherever Carnations are grown and shown there is Curzon—always to the front, indeed, quite seven times in ten the best flower of the exhibition. What a beautifully shaped petal—smooth, gently cupped, and of good substance. Its colours are rich, bright, well delineated, and strongly contrasted. Its outline is as unbroken as any flower I have ever cultivated, and its form good. It is of medium size and a good

\* *Pentstemon rotundifolius*, *n. sp.*—Species insignis (e grege *P. centranthifolius*), glaberrimus, glaucus; caulibus bast lignosis aperte-ramosis paniculato-plurifloris; foliis crasso-coriaceis orbiculatis integerrimis (majusculis sesquipedalicaribus), imis in petiolum subulatum contractis, ceteris arcte sessilibus ramulibus parvis, floralibus minimis subcordatis; pedunculis pedicellisque gracilibus; sepalis ovalibus lin. 2 longis; corolla minuta pollicari tubiformi apice subaequaliter 5 lobis, lobis lato-ovalibus (lin. 2 longis), fauce genitalibusque glabris; antheris post dehisceniam explanatis; capsulis lato-ovatis lin. 2–3 longis pedicello arcte marchato pendulis. *Asa Gray*, Bot. Contributions, issued March 4, 1887. *Proc. Amer. Acad. Sc.*, vol. xxii.

grower." And this is written after forty years' culture by the most successful raiser of the day. I should not be surprised if it is grown for another twenty years to come. Sarah Payne is, as before stated, a pink and purple bizarre; and although the class has received of late, and is yet receiving, fine additions, it is still largely shown. Thirty-five years ago Mr. Dodwell described it as follows:—"For refined texture and colour it leaves nothing to be desired. Well done and at its best it would grace the finest stand of flowers imagination could paint. The petal is of medium breadth, and very smooth; colour delicate, sometimes deficient of bizarre, but always rich; the white exquisite." To-day Mr. Dodwell endorses this by stating that "the variety lives and fully supports its old renown. In its way, I believe, as with Admiral Curzon, it will never be surpassed." R. D.

The aspect of many Rose gardens does not at the present time present a scene of loveliness. Mildew and orange fungus have been very prevalent this month (August), and the consequence is that most of the bushes are partially denuded of the leaves; for the effect of both of these pests is to cause the leaves to fall. Looking at my own garden I find green tops to the shoots, but lower down the leaves are all gone. I know that the advice is often given, not to leave the dead foliage about, as it may propagate the malady for another year. The same advice is given as to the Potato haulm, but I have never yet learned that in either case it acted as a preventive; however, if people think it may be of use it does no harm, and at any rate prevents an untidy appearance.

*Thinning Out the Shoots.*—I believe this to be an excellent plan. The general plan of pruning now

plan, whether he be an exhibitor or not, will have cause to regret it; moreover, he can leisurely do it, leaving only the pruning, in its strictest sense, to be done in the spring.

*Staking.*—Wherever Roses are well grown, and in suitable soil, they will have thrown up by this time long and vigorous shoots: some of these will carry a bloom at the point, and others not. There are some varieties which always bloom in the autumn, and others only occasionally so; but whether these shoots are flowering or not, they ought to be staked and tied, and in doing this care should be taken that the stake be as long as the shoot, or otherwise it is very apt to get snapped off. When the time and trouble necessary for this cannot be given, in default of a better plan the shoots may be somewhat reduced in height, but in every way staking is the better plan.

*Manure.*—It is too soon to think of putting manure on the beds, but it is not too soon, or too late, to give liquid-manure. It is generally believed that this is only of use for the development of the bloom, and that when that is over, it may be abandoned, but this is not the belief of many Rose growers, who prefer more liquid and less mulching. Thns, I was at a celebrated Rose grower and exhibitor's the other day, who rejoiced in a large tank well-filled with astounding *eau de Cologne*, which he told me would, in the course of a few weeks, be on his beds, a good dose being supplied every week; his contention being that the autumn rains would wash it down to the roots, increase their action, and so communicate fresh vigour to the plants. The Roses are gross feeders, and will take much strong stuff.

*Alterations.*—It is of course too soon to make alterations, but not too soon to project and make arrangements for them. It will by this time be pretty evident to the Rose lover what flowers he will discard, and what varieties he will introduce into his garden, for the knowledge he has picked up in various ways during the season will now be brought into practice; only let him beware of thinking that, because he sees a beautiful Rose at an exhibition he ought to procure it; let him enquire about its constitution, and if possible see it growing; for there are some, to grow which only entails disappointment. If you read in any catalogue "moderate" or "does best on maidens" you may rely upon it that, unless you are a grower of some experience, you had better "have none of it." There are a few things to be borne in mind in this selecting. If you live in a cold climate or unsuitable soil, do not get your Roses from a warmer climate. You will get, no doubt, magnificent plants, but they will feel the change, and bring you disappointment. Then about the Manetti—the seedling Brier or Brier cutting is gradually pushing the Manetti out of the field. Exhibitors will not discard it, as it pushes the Roses into bloom in time for early shows; but the amateur will do better to avoid it. It is very apt to throw up underground shoots, and these are too often looked upon as belonging to the Rose itself and are left on, and so ultimately over-power it, and a flourishing bush of Manetti replaces the Rose. Some say, if you can do so, select your own Roses, and mark them in the nursery; I hardly think that this is needful. Rose nurserymen are mostly careful to send out good plants, and I think that they may be safely trusted; still, if this is to be done at all, it is much better to wait until planting time has arrived, and then not only select but bring away your plants. [The Manetti cuttings should be made and prepared like Gooseberry cuttings—that is, all the buds visible on the part which will be under the soil should be taken out. Ed.]

The Rose grower need not spend an idle autumn; he has to keep his beds free from weeds, to watch for all suckers and underground shoots, and cut them away, and to see to the various matters mentioned now. He will not mind the trouble, for he knows no excellence is to be attained by any royal road, but by earnest and painstaking efforts. *Wild Rose.*

FIG. 31.—PENTSTEMON ROTUNDIFOLIUS: HARDY PERENNIAL: FLOWERS DULL RED. (SEE P. 264.)

## ROSES.

### AUTUMN WORK IN THE ROSE GARDEN.

THERE is a pretty strong feeling amongst the general public who grow Roses, that there is little to be thought of with regard to them after the blooming season is over, and that they may be safely left to themselves. Nothing can be wider from the mark than this, whether a grower be an exhibitor or not. I have always held that as the exhibitor has by experience gained the knowledge of the system by which he believes he can secure the best flowers, so the lover of the flower who does not exhibit may very safely follow out his plans, even if he does not carry them out to their fullest extent. The exhibitor does not leave his Roses to themselves when the season is over, but wisely takes such steps as may ensure him, so far as he can, a good bloom for the next season.

adopted is that of thinning out the old wood, and depending on the vigorous shoots of the present year for the bloom of next. Now that old wood is of no use, the general plan has been to leave it until the spring, and at the time of pruning cut it out; but why leave it until then? It will absorb a certain amount of the vigour of the plant which might well be spared; in fact, why not do with it as we do with our Raspberry canes? We know that the fruiting canes of the present year are of no use to the plant, and so we cut them away, and leave the new canes to get more light and air, to absorb the vigour of the plant, and to ripen better for next year. I believe that it will be equally wise to treat Roses in the same way. Cut out all the wood that you could cut out in the spring, and let that on which you depend for next season have a better chance, more and more light, more of the sun's ripening influence, and all the vigour that the plant can give them. I feel convinced that no one who adopts this

## ORCHID NOTES AND GLEANINGS.

## SEEDLING HYBRID ORCHIDS AT OAK-WOOD.

It seems but yesterday since the first Orchid Conference was held under the auspices of the Royal Horticultural Society at South Kensington, but it is more than three years ago, as it took place on May 12 and 13, 1885.

The paper read by Mr. H. J. Veitch, of Chelsea, on "The Hybridisation of Orchids" on that occasion no doubt stimulated many amateurs who had begun the work of hybridisation, and will have induced others to take up this interesting branch of occupation. Mr. Veitch's paper was published in the *Journal of the Royal Horticultural Society*, vol. vii., No. 1, 1886; and it may also be interesting to remark that just forty years previously an even more remarkable paper on "Hybridisation amongst Vegetables" was communicated to the same society by the Hon. and Very Rev. William Herbert, LL.D., Dean of Manchester; and published in vol. ii. of the *Journal*, 1847. The learned Dean had laboured assiduously in hybridising almost every class of hardy and exotic plants, and, amongst others, hardy Orchids and Ophrys, also Cattleyas, Bletias, &c. A good botanist and practical gardener himself, he strove to instill into the minds of gardeners the importance of taking correct observations of the work in which they were engaged. The whole paper, which occupies fifty-four pages of the *Journal*, is well worth careful study. In the passage referring to seedling Orchids he says:—"An intelligent gardener may do much for science if he keeps accurate notes of what he attempts, and does not jump at immature conclusions. . . . The cultivator has the test of truth within his scope,—

'Examenque improbum in istâ  
Castigat trutina;'

and, far from being an evil, I look upon it as a great advantage, because it will lead the industrious and intelligent gardener to take a higher view of the objects under his care, and to feel his own connection with science, and it will force the scientific to rely less on their own dictation, and to feel that they must be governed by natural facts, and not by their own preference." Evidently at that time the botanist laboured in his study over dried specimens, and tried to lay down his own rules for the separation of genera, and the gardener toiled on, little heeding the work of the botanist, and seldom caring to keep any correct account of his work. Herbert himself combined the two, and he tried, not unsuccessfully, to induce others to do likewise.

Amongst modern amateurs I do not know any one who takes such intense interest in raising seedling Orchids as Mr. N. E. Cookson, of Oakwood, Wylam-on-Tyne, nor one who has been so successful. I visited his garden rather more than two years ago, and he had raised numerous seedling Cypripediums and also a few *Calanthes*. He had also been successful with *Zygopetalums*, and told me at that time that he would advise beginners to start with the last-named genus, as being the easiest to raise. *Dendrobiums*, *Cattleyas*, *Phajus*, and other beautiful Orchids, have been hybridized with results that are worthy of record. Mr. Cookson is fortunate in having a gardener almost as enthusiastic as himself, who spares no pains to bring to a successful issue the attempts of his employer.

In a short conversation with Mr. W. Murray, the gardener, he gave me several useful hints of a practical nature on hybridising, which may be summarised as under:—

1. Hybridising the flowers, which is a simple process, and consists in removing the pollen masses from under their thin covering at the top of the column and at once attaching them to the glutinous mass on the column of the flower intended to bear seeds. This is lower down, and at the front. The sticky substance is placed exactly where a bee or other insect would push its head when trying to

extract the nectar from the flower. When the pollen has taken effect, the petals close over the column, Mr. Cookson says, to protect it from wet—a wise provision of Nature. The flower soon fades, and the seed-pod rapidly swells.

When the capsule has arrived at maturity it splits open, and the seed would be scattered unless it is cared for. To ascertain if the seeds are good a few are placed in vinegar, and under the microscope the germ can be seen in the form of a black speck. Some species of Orchids will ripen their seed-pods in three months, and in the case of *Calanthes* I saw nice plants from seeds, and the flowers from which they had been obtained were fertilised only eight months previously. Cattleyas, on the other hand, are very slow. The seeds are seldom good if the capsules ripen under twelve months. They sometimes take as long as sixteen months to ripen good seeds.

2. A good seed-bed is of the utmost importance, and, perhaps, the seeds vegetate best if sown amongst the moist growing sphagnum and fibrous peat, charcoal, and potsherds, in which the parent plant is growing. Perhaps it is best to have indifferent plants of varieties of little value to sow the seeds upon. The compost ought to be kept to an uniform degree of moisture until the plants appear. Mr. Cookson approves of planting them out singly in very small pots as soon as the plants can be handled. After this process they are again kept moist; but not at any time saturated with water, or allowed to become dry. Mr. Cookson has had a great success with *Dendrobiums*; not one had been raised two and a half years ago; now there are 1700 plants from twenty capsules. In fact, only twenty-two capsules have been produced, and twenty of them gave a plentiful supply of good seeds. The plants also grow very rapidly; for instance, a seedling, the production of a cross between *D. Wardianum* and *D. aureum*, has made three growths since it was pricked out on March 13. No less than eighty different crosses of Cypripediums have been made. Of *C. Sanderianum* and *C. Veitchii* there are good plants. Also of *C. niveum* crossed with *C. Stonei*, and *C. Stonei* with *C. Farriaeanum*. Mr. Cookson has also found that the produce of weakly parents often give very vigorous offspring. *C. Veitchii* (superbiens) and *C. levigatum*, for instance, are not robust growers, but their offspring are. A remarkable instance of this may also be found in the case of *C. grande*, raised in Messrs. Veitch's nursery at Chelsea, by crossing *C. Roezlii* with the pollen of *C. caudatum*. It is the most vigorous of all known Cypripediums. It has also been found that all *C. Lovianum* crosses are unhealthy or diseased in a young state, but the plants that survive grow out of it.

Amongst Cattleyas plants have been obtained of *C. Trianae* crossed with *Lælia harpophylla*, and *vice versa*.

*Masdevallia* crosses have also been obtained, and it was noteworthy that plants raised from crossing *M. tovarensis* with *M. chimera* grew with astonishing rapidity. Seeds sown in March, 1887, produced plants, on one of which I counted ten leaves. Mr. Cookson was the first to obtain hybrid *Odontoglossums*, as he stated in the *Garden* for February 10, 1883, but all the plants perished. Bigeneric crosses have also been named, and plants obtained, but it is best to wait until the flowering of the plants verifies the expectations that have been formed. Capsules may be obtained containing good seeds of such crosses, but it has been found when the plants flowered that the progeny were exactly like the seed-parent, showing that the flowers had in some way been fertilised with their own pollen. Others besides Mr. Cookson are working in this field. I have done a little myself, but am free to admit that I have not yet seen anything like so much progress made by any amateur as has been made here during the last five or six years. *J. Douglas.*

## MILTONIA MORELIANA.

The finest variety we have seen of this superb *Miltonia* is in the Kew collection, and it is now bearing several flowers. It is a variety of the variable *M. spectabilis*, and very similar to that

figured in the *Botanical Magazine* as *M. s. var. atrobubens*. Each flower is about 4 inches across, full, and of a deep port-wine colour, shaded with rose. The flowers have the excellent quality of lasting more than a month on the plant.

## PHALENOPSIS AT KEW.

The display of flowers of *Phalenopsis* in the Orchid-house at Kew has for some weeks been exceptionally fine, and is still good. The majority of the flowers are those of *P. grandiflora*, and some of the varieties are large and perfect in shape. We notice that the plants are grown in tall cylinders, and the healthy appearance of the leaves shows that the treatment is the right one. A fine example of *P. Mariae* is also in flower. *W. W.*

## ORCHIDS AT CAMBRIDGE LODGE, CAMBERWELL.

Most Orchids are well done at Cambridge Lodge, the residence of R. J. Measures, Esq., but some genera better than others. In the opinion of that clever and observant Orchid grower, Mr. Simpkins, who has charge of the collection, Cattleyas generally, and many *Lælias*, are good plants for the smoke-laden neighbourhoods; *Vanda* tricolor, and the varieties of *V. suavis*, are almost as manageable; *Odontoglossums* and *Oncidium* thrive, and the favourite of the hour, the *Cypripedium*, is, if liberally treated, the most grateful and satisfactory of all. A glance round the collection shows all these and many other species in large numbers in robust health. It is said that the foggy atmosphere of London does not affect the health of the plants, if properly managed, but plays havoc with the flowers in the winter, and especially those of *Cattleya Trianae*—but not every year.

Were there not a flower expanded the *Cypripediums* in the two commodious houses devoted to these plants would be a pleasant sight by the endless variety of beautifully marked leaves—green, marbled, blotched silvery-white, and other delicate shades; the under-sides of the leaves in many cases tinted dark crimson or brownish-purple. Few plants amongst those grown for the beauty of their foliage can excel in the variety of leaf-marking the large specimens, *C. marmorophyllum*, *C. javanicum*, *C. Dayanum*, *C. Veitchianum*, the varieties of *C. Godefreyae*, and others, as grown at Cambridge Lodge. But beautiful though the varied foliage is, there is no lack of flowers the year throughout. At present a large number of rare species is in bloom or bud, especially noteworthy being *C. Ashburntoniae expansum* ×, which, with its circular and beautifully spotted dorsal sepal and larger flowers, is immeasurably superior to the commoner form, which is also in bloom beside it; *C. gemmaiferum* × is handsome in flower and leaf; *C. javanicum superbiens* ×, a stately plant; *C. Charles Canham* ×, a fine large flower; *C. marmorophyllum* × and *C. selligerum majus* ×, two excellent varieties; and the *Sedenifera* section, which seem to be perpetual flowering, make a beautiful and varied show, being represented by large specimens of *C. Sedeni* ×, *C. calurum* ×, *C. Ainsworthii* ×, *C. cardinale* ×, and *C. porphyrium* ×, many others being in hand.

In the large class comprising the varieties of *C. barbatum* there are likewise several in bloom, the largest and richest-coloured being *C. b. grandiflorum nanum*, and the prettiest of the light-tinted ones *C. b. pulcherrimum*, which has flowers exactly like *C. callosum*, but of the *barbatum* form. *C. Godeffianum* ×, and *C. Germinyanum* ×, two *C. hirsutissimum* crosses are also in fine condition, as also many hybrids which have not yet bloomed.

The large and varied collection of *C. insigne* occupy a span-pit in summer, as their flowers are found to come better when so treated.

The Cattleyas and *Lælias* are in splendid condition, and especially the large lot of *Lælia elegans* Turneri varieties, some of which are still in bloom. The *Odontoglossums* and *Oncidium macranthum* and *O. undulatum* and others of that class are in fine condition; the house full of *Vandas* as good as could be desired, and that of *Phalenopsis* in a sound

and vigorous state, and far beyond the average state of these plants in other collections. Many plants of ordinary interest are in bloom; and others, representing rare things seldom seen, are two good specimens of the handsome *Miltoia Peetersiana*, supposed to be a natural hybrid between *C. Clowessii* and *C. spectabilis* Morliana; its rosy-purple flowers are much like small *M. s. Morliana*, but they are borne several together on upright spikes. The pretty *Saccolabium Henricsonianum*, with pink and silvery-white flowers, and the rare scarlet and crimson *Renanthera matutina* are also in bloom, as well as a vigorous plant of that richest-coloured and rarest of Cattleyas, *C. Hardyana*, a supposed natural hybrid between *C. aurea* and *C. gigas*.

## THE CALABRIAN PINE.

*PINUS PYRENAICA* (VERA).—(See fig. 32, p. 268).—The *Pinus pyrenaica* of English plantations is now generally considered to be a mere form of the very variable *Pinus Laricio*, or Corsican Pine, and recognisable among other things by the deep orange colour of the young shoots. But there is another plant which has also received the name of *pyrenaica*, and to which the appellation should strictly be confined. This is a tree which, on the authority of Parlatoire, is a native of the forests of Central and South-Eastern Spain, the mountains of Calabria, the islands of Cyprus and Crete, the Caramanian Taurus, Syria, and Bithynia. Not unnaturally, it has received a variety of names, as generally happens when botanists describe a specimen from one locality without having the opportunity of detailed comparison of specimens from other regions. For our own parts, we have adopted the synonymy given by Parlatoire, but for the special synonym of *P. brutia* we have had personal opportunity of making the necessary comparison.

The tree in question has been confounded with *P. pinaster*, as in Veitch's *Manual*, but from which it differs considerably, with *P. Laricio*, and with *P. halepensis*. M. Naudin, who kindly furnished the specimen (without a name) whence our illustration (fig. 32) was taken, warned us that this was a species "*qu'il ne faut pas confondre avec le P. halepensis*." Gay, in a note in the Kew Herbarium, says it differs from *P. halepensis* in its leaves, which are twice the length of those in *halepensis*; in the cones, which are oblong, not ovoid; and in the scales of the cone, which are depressed, not raised in the centre. We may also add that the stems are less glaucous, and the cones are on much shorter stalks, spreading, not deflected, broader at the base, and with flatter apophyses. Lambert unfortunately confounded both *halepensis* and *Laricio* under his *maritima*. He subsequently corrected the mistake in part, so that t. ix., vol. i., ed. 1, folio, represents *Laricio*, though called *maritima*. His t. x., vol. i., shows a detached cone with prominent apophysis = the *P. halepensis* var. *B*, of Tenore, while the cone on the branch has a flat apophysis, like *brutia*. We transcribe our notes taken from M. Naudin's plant, which we have compared with the specimens in the Kew Herbarium and Museum, and in particular with the type specimens of *P. brutia* of Tenore.

Barb grey. Herbaceous shoots green, naked at the base, marked with prominent pulvini.

Leaves two, in a very short sheath, 4½ inches long, linear-pointed, concavo-convex, serrulate, with stomata on all sides. In section the leaf is boat-shaped with an epiderm of cuboidal cells, beneath which is a

very thick layer of hypoderm (which must give great resisting power to the leaf and adapt it to windy localities). The leaf substance consists of sinuous cells filled with chlorophyll; through its centre passes the double vascular bundle surrounded by an elliptical-bundle-sheath or endoderm of oval cells filled with starch, and enclosing a "pericycle" of cellular tissue with masses of woody cells separating the two fibro-vascular bundles. Two resin canals traverse the leaf substance just beneath the hypoderm on the upper surface. This structure is identical with that of Tenore's *P. brutia*, and of Visiani's *P. Paroliniana* and of Kotschy, n. 420. It is also the same as *P. halepensis*, but differs from that of *P. pinaster* and *P. Laricio*, with which it has been confounded, from which the mere inspection of the leaf-section will enable the observer to distinguish it.

The male catkins are solitary (quere always so?) erect, oblong, about half an inch long, orange-coloured, anther-crest orbicular crenulate.

Cones lateral, solitary, or in groups of three (Tenore's specimen, showing a large number in a cluster, is accidental), each shortly stalked, spreading more or less horizontally; ovoid, conic, acute, rich shining chestnut brown, 3½ inches long by 2½ in breadth. Scales woody, apophyses rhomboid, flatish, with a slight transverse ridge and a rather short pyramidal umbo. In the fully-developed cone the upper angle of the scale is often prolonged into a short blunt process.

What follows is taken from the *Pinetum Woburnense*, p. 27:—

The Calabrian Pine "bears a strong similarity to the *P. maritima* of Lambert, as well as to the *P. halepensis*, but is readily distinguished from either of these species by its much longer wavy leaves, which vary from 3 to 5 inches in length, whilst those of the above-mentioned species are seldom above half the size. The cones of the *P. brutia* are also quite [nearly] sessile, growing in large clusters [or singly] surrounding the stem. A splendid figure of this is given in Mr. Lambert's third volume of his *Genus Pinus*, in which he says that 'Sprengel has even referred it to *P. pinaster*, not even allowing it the rank of a variety; but no two species can be more distinct; the leaves in *pinaster* are straight, rigid, twice as stout, and disposed in interrupted verticils; and the cones are double the size, with the scales elevated and angular. The specimen represented in the plate was obligingly communicated to me by the Hon. William T. H. Fox Strangways, Under Secretary of State for Foreign Affairs, who received it from Professor Tenore.' It, however, appears to me to be more nearly allied to the *P. halepensis* than to any other of the species. The Woburn collection is indebted for this new and valuable Pine to the Right Hon. the Earl of Mountnorris, who, I believe, was the first that raised it from seeds in this country, and kindly sent a couple of plants of it, along with a valuable collection of other plants, to Woburn. It is a native of Calabria (the ancient Brutium), where it attains a considerable size, and produces timber of a very superior quality."

This tree has been highly spoken of for the purposes of reinforcing the Karst and the Adriatic coast. M. T. M.

## CULTURAL MEMORANDA.

### GAILLARDIAS.

THESE are among the most showy of plants, and several of them are of great value for growing in borders, as not only are they striking in the size and colour of their gorgeous flowers, but they last a long time when cut. The finest of all the varieties that I have yet seen is the true *G. maximus*, which I met with a few days ago in the grounds of Mr. Thompson, of Ipswich, where it is grown for seed, and the difference between it and *G. grandiflora* could be seen at a glance. The last-named, however, is a noteworthy kind, and has long been a favourite with many, and no garden of any pretensions should be without the one or the other. *G. grandiflora* is said to be a hybrid between *G. picta* and *G. cristata*; and besides this there are now several garden crosses, and as the plants breed and seed freely, many more may be expected, but they will have to be good to surpass those mentioned above. Although these Gaillardias are hardy perennials, they will not

succeed in all soils or live through all winters, and it is a wise plan to treat them as annuals or biennials, and raise fresh ones frequently, as that is the best way to make sure of them being vigorous, healthy, and strong; or they may be kept satisfactorily by striking fresh ones from cuttings, and the time to do this is in early autumn, when they may be put in under handlights, or in pots, and protected by being shut up in a close frame, in either of which places, if syringed or damped occasionally, they will soon root, but should not be planted out till the spring. J. S.

### ONOSMAS.

There are two varieties of this Boragewort that are highly deserving of cultivation, the one being *O. tauricum*, the "Golden Drop," and the other *O. coccineum*, the last, as its specific name implies, bearing bright red flowers, which, though not large, are very showy and telling. The first has long tubular-shaped blossoms of a lovely citron or pale yellow, and these are borne on stout drooping stems from which they depend and make a fine show. The best situation for growing these *Onosmas* is on an elevated position such as a rock garden affords, as there they may be seen to advantage.

The easiest way of propagating the first-named is by means of root cuttings, which if put in in sharp sandy soil and kept close under a handlight will soon root. J. S.

## NURSERY NOTES.

### BERGHOLT, COLCHESTER.

MR. FRANK CANT, of Bergholt, and Mile End Nurseries, Colchester, the winner of the Trophy of the National Rose Society this year, has attained such signal success in the various tournaments of Roses which have been held in the metropolis and the provinces in the last few years—and this, too, in face of the powerful opposition of the longer established growers—that we were very pleased to accept an invitation to run down and see for ourselves what manner of place it was, and to discover, perchance, the grounds for the excellence of his flowers. Truly the prominent idea with us before the visit was made was that the Roses would be found to occupy a cosy warm sheltered position, comparatively protected from the ills to which Roses so often fall victims. That idea was soon dissipated on approaching the nursery, for a more thoroughly bleak, wind-swept spot could scarcely be found elsewhere. The house at Bergholt is a new one, facing, I believe, S.E., without a plantation or anything higher than a well-kept hedge for miles in that direction; therefore all cosiness for Rose or man is out of the question when cold weather prevails.

The main quarters of the Rose stand a few feet higher than the house, but as is little sheltered as that, and form part of a large field at present under farm crops. One-half the area of Roses is level land, and the other has a gentle slope towards the south; but there was nothing to indicate that the plants on the slope have any advantage over their brethren on the level. The general goodness of the flowers as observed in exhibition stands, and the robustness of shoot and leaf remarked at the nursery, are evidently due to soil and manuring. The former is a heavy yet friable loam—terrible stuff to trample about upon after rains, containing numerous stones, and not of the kind which gives out after a short period of sunny weather. Nor does it appear that rain such as we have this year experienced has had any detrimental effect on the plants; excepting that it would seem to have brought about an unexpected and unusual denudation of the foliage itself—a result that would rather seem to be appropriate to a hot dry summer than a dripping one. On Teas many fine blooms were open, and to come, and the growth of the young shoots did not seem to be checked in any great degree by the untimely fall of the old foliage.

The nursery has much of the appearance of a new enterprise; the dwelling-house itself stands somewhat back from the road, and is flanked and

fronted by a few young ornamental trees, and some few flowering plants are dotted about, but you soon begin to find that everything is subordinated to the Rose, and it is this determination to put the Rose culture before everything else that has enabled Mr. F. Cant to get into the very front rank as a grower of the flower. A few yards away on the east of the dwelling there are wide borders filled with robust Teas worked on the seedling Brier or cutting-struck Brier. These plants are never lifted and never protected in any way, and yet there were no gaps in the rows but those caused by digging out to complete orders, and the shoots made were exceedingly robust. Many of the varieties possessed beautiful flowers, the majority of which would not disgrace an exhibition in June. The following are a few of such:—*Souvenir d'un Ami*, *Souvenir d'Elise*, *Rubens*, a flower which has been fine all through this season; *Perle de Lyon*, *Niphotos*, *Marie van Houtte*, *Madame Willermoz*, *Devoniensis*, still finding admirers for its peculiarly agreeable scent; *Jean Ducher*, a prodigious flowerer—so many flowers appeared that they could not expand, and required to have the buds reduced in numbers.

A large border was wholly filled with *Maréchal Niel*, in standards and half-standards—these plants were still bearing flowers and had borne enormously. That fine variety, *Ulrich Brunner*, than which no other Rose has been seen so good this year, does well here; it is a robust grower and possesses a good habit. In these borders there were fine blooms of *Rosieriste Jacobs*, a beautiful crimson Rose; of *Catherine Mermet*, also excellent this season; and of *Duchess of Edinburgh* (*Veitch*).

The Rose quarters previously mentioned as lying behind the dwelling-house cover at present an area of  $7\frac{1}{2}$  acres, and contain about 35,000 dwarf Roses, mostly worked very low on the Brier and *Manetti*, the remainder—as many more—would be represented by standards, half-standards, and climbing Roses. Nothing could exceed the thrifty look of the stock here, firm shoots, short-jointed, and a habit of great compactness. It is not our intention to do more than select a few of the new and newer varieties observed in flower at the time. *Vicomtesse Folkestone* is a showy, light-coloured flower, of good form, and a strong grower. It is erroneously called by some persons a hybrid Tea, but the foliage is identical with that of most hybrid perpetuals, and would seem to point to its belonging to that section. The *Bride* (*Henderson*, New York, U.S.A.), is a white *Catherine Mermet*, a sport from which variety it is; *Countess of Pembroke*, *Earl Dufferin*, *Miss Ethel Brownlow*, a Tea-scented Rose, and *Lady Helen Stuart*, the last three raised by Messrs. A. Dickson & Son, Newtonards, have done well, and are already much in request. For fuller particulars of these and other new Roses of the year see our issue for August 25 last, p. 207. It may be stated as Mr. Cant's opinion that *Miss E. Brownlow* will take the place of *Madame Cusin*, which it much resembles in colour.

*Comtesse de Nadaillac* is a Rose which finds a ready sale. *Madame Eugene Verdier*, a Tea-scented variety, good for a pillar or a wall, canary-yellow—a bouquetist's flower in the bud; as is likewise *Amazon*, with a flower like *devoniensis* in shape, but of deeper tint. *I.* is a weakly grower. Flowers of *Innocenta Pirola* have grown this season to 6 inches in diameter.

*Grand Mogul* (W. Paul), a crimson-rose shaded with maroon, is considered to be about equal to *Jean Sonpport*.

*Etoile de Lyon* has grown well, but no fine blooms have been produced here this season; *Ella Gordon* (Paul), of Victor Verdier form, has given much satisfaction; *Victor Hugo* has the colour of *Xavier Olibo*, and grows better than that variety; *M. Matbaron* is very similar to *Pitaud*, but better—it is a very dark coloured Rose.

*Silver Queen* (W. Paul) is a small grower, but still not delicate; it has grown and flowered fairly well.

Plants of *Princess of Wales* (Bennett) were

FIG. 32.—*PINUS PYRENAICA*. (SEE P. 267.)

A, Shoot and detached cone; B, Foliage; C, Plan of section of leaf, magn.

observed; *Baron Nathaniel de Rothschild* is a good dark Rose of 1882, not seen often as yet; *Baronne de Rothschild* is very fine as an autumn Rose.

Besides the area at Bergholt a large quantity of stocks for working Roses on—viz., *Manetti*, seedling Brier, and Brier cuttings—are planted at Mile End Nursery, situated on the south side of Colchester.

Here the land is heavy, and well suited for the purpose of growing Roses. A small quantity of general nursery stock is grown at Mile End, of which it was remarked that the Cherries, Plums, and Pears were the best.

Mr. F. Cant is a young man endued with an enthusiastic love of Roses, and considerable know-

ledge of their vagaries and idiosyncracies, and is consequently a dangerous opponent at exhibitions, as many of our friends have already learnt. We believe that the business has not been established longer than eight years, but even now the stock of saleable plants is equal to any probable demands made upon it, and will be increased as occasion demands.

## PLANTS AND THEIR CULTURE.

**BEGONIAS.**—*Begonia socotrana* is just now starting into growth, and should be repotted without delay as it is impatient of being disturbed after much growth has been made. The new bulbils are produced round the base of the shoots, therefore keep this part of the plant beneath the soil; in re-potting place the plants in a light position, near the glass, and in a temperature of 60°–65°; maintain a moist growing atmosphere, but water sparingly until they have made considerable growth. The soil best suited for this, as well as the other *Begonias*, is a rich loamy compost rather inclined to be light than heavy. There are several hybrids of *B. socotrana*, but I am of opinion, that it is still better than any of its hybrids. Any plants of other species which require potting, should be attended to, and placed in a mild heat. By shutting up early, fire-heat would not be requisite for some time yet. But to flower satisfactorily in winter an intermediate temperature, about 55° to 60°, must be afforded them.

**Chrysanthemums.**—The earliest-flowering varieties, such as *Illustration*, *Chromatella*, *Little Bob*, &c., are now coming in, and very useful they are. To prolong their flowering season, stand them in a position having a northern aspect, give plenty of air, and shade from bright sun. Where dwarf plants are much required, at a later period, the usual plan of rooting large tops of the later-flowering sorts taken from plants which are planted out, is a satisfactory method of getting up a stock.

Select clean robust pieces about 6 inches long, and which are showing signs of breaking below the terminal bud. Insert them three together in 60-pots, place in a frame with gentle bottom-heat, watering and shading to prevent flagging, when if all goes well they should be nicely rooted in about twenty days, by which time they will require potting into 5-inch pots, employing a rich potting compost. Insert a small stake to each plant, keeping them rather upright, so as to form a dense head when in flower. If single plants in the pots are desired, they are best struck singly in pots of small size, and perhaps put in a little earlier. These small plants will be most useful for mixing in flower stands, or, indeed, for any kind of dwarf decorative work. The main stock of plants will now require careful attention, and by this time it should have been decided whether the terminal or lateral buds are to be retained. Whichever has been selected pinch out all subsequent superfluous growths, so as to concentrate the plant's energies on the buds which are left. In all cases where the pots are well filled with roots, water with weak liquid manure at regular intervals. Soluble nitrogenous manures, such as nitrate of soda, sulphate of ammonia, &c., are valuable fertilisers, but when applied alone, they are most serviceable just as the buds begin to show colour; they have then a wonderful effect both in increasing the quality and size of the blooms. If applied earlier, they are apt to cause too succulent growth, with abortive flowers; in any case, they require to be cautiously used. Farmyard liquid manure is the best in the earlier stage of growth, but failing that, give a top-dressing of some concentrated fertiliser containing the important elements nitrogen, phosphorus, and potash combined—say as is found in Standen's, Clay's, Jensen's fish potash manure, or similar compounds; they will give excellent results. *F. Ross, Pendell Court, Bletchingley.*

## THE FLOWER GARDEN.

**FLOWER-BEDS.**—The recent gales and thunderstorms have played havoc amongst the usual summer flowering and foliage plants. If not already attended to, they had better be looked over at once, and put into a neat and trim condition, which ought to be done, to carry them on to the end of the season. Zonal *Pelargoniums* should have all decayed flowers, leaves, and seed-pods picked off, after which, if

favoured with a little bright sunshine, they will again make a presentable appearance. *Petunias*, *Heliotropes*, *Verbenas*, and such-like plants should have the shoots regulated, whilst *Stachys lanata*, *Perilla*, and other dwarf foliage plants will need pinching back and putting in line where overgrown. Sub-tropical plants of a soft-wooded nature will also need attention, when grown in groups, arranging that each specimen stands clear of its neighbours.

Carpet-beds, in some districts, have doubtless been a failure this summer owing to the cool nights and want of sunshine; in favoured localities, however, of which perhaps ours is one, some of the plants employed have made luxuriant growths, and more than ordinary attention has been wanted to keep them within bounds. Such beds will require to be looked over twice more at the least before the end of the month to keep the various lines and panels as accurate as is practicable.

**Florets.**—Preparations should now be made for transferring these to their winter quarters, and brick pits or frames with 9 inch walls are undoubtedly the best in cold districts. When made up the bed of soil ought to be sufficiently near to the glass as to give the plants head room only; the surface soil of the beds should have a depth of 6 inches, and should consist of good turfy loam and leaf-mould, three parts of the former to one of the latter. As regards distance at which to plant, this will depend on the size of the plants; they ought, however, to stand quite clear of each other, so that in dull damp weather there will be less risk of the flowers damping off. Cucumber and Melon frames are frequently made use of for this purpose, and in some of the southern counties it is only necessary to move the frames to the borders on which the plants have been growing during the summer. In these cases the end of the month or early in October will be quite early enough to put the frames over the plants. Previous to planting cut off all runners, and for some little time afterwards put the lights on at night only, leaving them slightly tilted at the back.

**Shrubs.**—Examine clumps and borders occupied with old plants, regulate and cut back straggling shoots of this season's growth where they are overcrowded or encroaching on their neighbours, of Yews, Laurels, and other plants whose flowers do not constitute their principal attraction, and burn all prunings immediately afterwards. Look over those that were planted spring and autumn, tying up the leaders and loosening old ties where necessary. *J. Horsfield, Heytesbury.*

## FRUITS UNDER GLASS.

**PINE-APPLES** swelling their fruit will now require careful attention, to keep the soil in a genial state of moisture, for if this becomes too dry the fruits will shrivel, and if too wet they are liable to become black in the middle. Do not afford them too strong doses of manure-water as the sun declines in power. Use the syringe with caution on swelling fruits, otherwise the crowns will develop to undesirable dimensions; let the temperature be 80° at 10 P.M., falling to 75° at daybreak; sprinkle the paths and plunging material on the morning and evening of fine days.

**Successions.**—Queens which are intended for starting early should be induced to rest by gradually withholding water, lowering the temperature, and giving free admission of air on all favourable occasions. Guard against excessive dryness at this season, as the sun shines forth with great power at times and the plants would be seriously crippled if not permanently injured if the soil were too dry. Cease syringing overhead and resort wholly to sprinkling the paths and other surfaces; a temperature of 70° will be high enough at a maximum at 10 P.M., allowing the thermometer to fall to 65° by the early morning. Growing stock should be kept steadily moving until the growth is fully made for the season, and the pots are filled with roots; supply them with weak manure-water every time they require watering, changing it each time, weak guano, drainings from a dung heap, and a dust over of Thomson's Vine manure being all employed in turn. Cease the use of the syringe overhead and only damp the paths, walls, &c. Shut up so as to secure a temperature of 55° for the time, but let the temperature decline to 75° by 10 P.M.; and the fires should be started in good time to prevent a too rapid subsidence. Look carefully after young stock, and pot on all suckers which have

filled their pots with roots. These plants should not require water for two or three weeks after being potted, unless the soil was in a very dry state when potting took place. Slightly dew over with tepid water, and shade during bright sunshine for the first fortnight, but do not allow the shading to remain over the plants longer than is necessary. Let the bottom-heat be kept as near 85° as possible.

The latest suckers should now be got in without further delay, in order to have them well-rooted before winter sets in. Strong growing sorts, like the Cayenne, Charlotte Rothschild, Providence, and Black Jamaica, may be placed in 8 and 9-inch pots, provided the suckers are of good size; but suckers of Queens and small ones will be better if put into 6 and 7-inch pots. Ample drainage should be afforded, and a handful of soot should be placed over the crocks. In preparing the soil for potting sift out the smaller particles and make use of the fibry part, and to every 2 bushels of loam add a 6-inch potful of bone-meal or Thomson's Vine manure and the same quantity of soot. If the soil be in a proper state of dryness it cannot be made too firm by ramming it into the pots; plunge the plants, so that they are close to the glass, and let the bottom-heat range from 85° to 90°. Shade during very bright sunshine, and dew over with water at 85°. This should not be done so as to cause the moisture to run off the leaves into the pots. Whenever the roots appear at the sides of the pots give a good watering, and no more should be given until the plants actually require it. After the first application of water cease the use of the syringe overhead. *W. M. Baillie, Luton Ho.*

## THE KITCHEN GARDEN.

**ONIONS.**—These should now be got under cover as soon as possible before they are affected by the slight frosts which are not rare at this late period, otherwise they will not keep well. If the bulbs are still green, the tops should be laid down flat, the bulbs exposed to the sun, and as soon as growth ceases they should be pulled up. In view of continued showery weather, it will be best to remove them altogether from the beds to hard walks or hurdles, where they can easily be turned over to dry, and quickly covered if necessary. When sufficiently dry, they may be spread out thinly in a dry place, to be cleaned and sorted as opportunity offers, when they may be tied in ropes, or placed on shelves in a dry, cool shed.

**Cabbages.**—A plot of ground should now be got ready for planting; many gardeners make a practice of planting the main crop of these on the ground the spring Onions have been taken from. In any case, the ground should be well manured (cow-manure being the best for the purpose), and deeply dug previous to planting. The roots should be preserved as much as possible when lifting, to prevent any check to their growth. It is well to plant some Cabbages from the earliest sowing on a border with a southern aspect, or some other warm position, in order to get a supply as early as possible in the spring. Smaller varieties, such as *Ellam's Early*, may be planted 18 inches apart each way; but for *Mein's No. 1* and many others, large growers, 2 feet each way is not too much if the soil be rich.

**General Work.**—A quantity of French Beans should now be sown in pots, and put into cold pits, to be eventually removed to warmer quarters; and when frost is anticipated it is well to gather all of the Scarlet Runner Bean pods that are ready. They will keep fresh for a considerable time if spread out thinly in a cellar, or similar cool, damp place.

Peas may also be had in winter by sowing at the present time *Chelsea Gem*, or some similar variety, in 8-inch pots, placing the pots in a frame now, and on a shelf in a Pine stove by-and-by.

All fruits on Tomatos should be exposed to the sun as much as possible. Any that are partially ripe will ripen successfully for use if they are placed on shelves in a late vinery.

Advantage should be taken of dry weather to destroy weeds, especially among Spinach and other standing winter crops. *W. H. Divers, Ketton Hall, Stamford.*

**HECKFIELD.**—The first show of a cottagers' society to be called the Heckfield and Mattingley Horticultural Society, was held in the gardens at Heckfield Place, on Tuesday, August 25, by the kind permission of Viscount Eversley. Mr. W. Wildsmith is the Secretary.

*Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.*

## APPOINTMENTS FOR THE ENSUING WEEK.

### MEETINGS.

MONDAY, SEPT. 10—Chambre Syndicale of Ghent.  
TUESDAY, SEPT. 11—Royal Horticultural Society: Fruit and Floral Committees.

### SHOWS.

WEDNESDAY, SEPT. 12—National Chrysanthemum, Royal Aquarium, Westminster (two days).  
Glasgow and West of Scotland (three days).  
Cheltenham (two days).

### SALES.

Bulbs, by Messrs. Small & Co., at 23, Lime Street, London, E.C., at 12.30 P.M.  
MONDAY, SEPT. 10—First-class Bulbs from Holland, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.  
TUESDAY, SEPT. 11—Greenhouse and Stove Plants, at Eastgate Nurseries, Peterborough, by Messrs. Protheroe & Morris (two days).  
Bulbs, by Messrs. Small & Co., at 23, Lime Street, E.C., at 12.30 P.M.  
WEDNESDAY, SEPT. 12—First-class Bulbs from Holland, at Stevens' Rooms.  
Choice Orchids in Flower, and Imported Orchids, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.  
THURSDAY, SEPT. 13—Great Annual Trade Sale of Greenhouse Plants at Lord's Nursery, Swanley Junction, by Messrs. Protheroe & Morris.  
Bulbs, by Messrs. Small & Co., at 23, Lime Street, E.C., at 12.30 P.M.  
FRIDAY, SEPT. 14—Established and Imported Orchids at Protheroe & Morris' Rooms.  
First-class Bulbs from Holland, at Stevens' Rooms.  
SATURDAY, SEPT. 15—Dutch Bulbs, at Protheroe & Morris' Rooms.

IN our present issue we give a short report of two provincial conferences that have already been held with respect to the development of fruit-culture as a national industry. Next week we hope to be able to make mention of the meeting at the Crystal Palace, and, later on, of that in the old home of the Royal Horticultural Society at Chiswick, where, it will be remembered, the most extensive and most successful conferences were held a few years since. We can but rejoice heartily at the public interest manifested in this question. So much more might be done than is done—so many more pounds might be retained in our own pockets—so much less coin find its way into the coffers of our neighbours. All this must be admitted; but in their zeal, the promoters of extended fruit-culture must not suffer themselves to fall into the delusion, that fruit-culture is to be a perfect cure for agricultural depression. To say, as one gentleman at St. Alban's is reported to have done, that "in the growing of Fruit lay England's salvation" is to use the language of exaggeration. It may—and we believe will be—very useful as an auxiliary, and if it enforce on our agriculturists the recognition of the folly of putting all their eggs into one basket, to use a homely proverb, it will do good service. Nevertheless, we have only to look back to the Fruit Crop Reports given annually in these pages for the last quarter of a century and upwards, to see that the risks and contingencies of fruit-growing on a large scale are, to say the least, as great as those with which the farmer has to contend, while the difficulties in the form of land-laws, markets, and transit are certainly no less.

The Conferences will, we hope and believe, do much to show what sorts can be grown at a

profit in particular localities, and what sorts it is a mere waste of space to cultivate. For the selection of appropriate stocks and other details of cultivation, the farmer or market-gardener must at first depend upon the gardener or the nurseryman. Whatever, is to be the future of agriculture in this country, it is certain that the farmer has much to learn from the gardener. Fruit culture just now is in the air, but it is only one resource out of many open to him. In the future it will be by the careful study and extension of the methods adopted by the florist and the gardener that progress will be made. The knowledge of first principles is not too well ingrained among gardeners—it is all but absent in the great mass of farmers; and yet upon the teachings of physiology and chemistry, and upon practical experiments made in experimental gardens—success depends in the future. This, it will be said, is a slow and tedious process, and so it is; but have not the teachings of experience been tedious and slow? Any means whereby combined action may be brought to bear upon the search for knowledge and its application to practice must be welcomed as hastening the rate of progress, and in this direction a reconstructed Royal Horticultural Society might do much good. In these days of specialisation, however, and particularly in the present state of things, it seems almost hopeless to expect that the Society will take its proper place at the head of all such movements, and therefore it is well worth considering whether the time has not come for the formation of yet another special society, if we cannot have, as we should prefer, a special department of the Royal Horticultural Society. On this subject a correspondent writes:—

"In the interest of the fruit-growing industry of this country it is greatly to be hoped that one of the good results likely to accrue from the holding of conferences this autumn will be the formation of a National Fruit Growers' Society. We believe it to be one of the pressing requirements of the times. At first sight it appears somewhat strange, in these days of keen competition and business enterprise, that such a society has not been brought into existence long ago, and it is only because we believe it to be an absolute necessity—seeing that we are soon to have a Minister of Agriculture and Horticulture—that we call attention to the subject at this juncture, trusting thereby to stimulate the energy of those whom it most concerns. In a matter of this kind the duty of the Press begins and ends with drawing the attention of practitioners to the subject, and with directing or pointing out the channels in which their interest lie, and it is for them, and for them alone to take active proceedings afterwards, to set in motion the machinery through whose agency they are expected to reap advantageous results.

"There are already a few local societies in different parts of the country, and these we have reason to believe are doing a real and substantial service to their members. These in time to come will doubtless be largely increased in numbers, and, in our opinion, advantageously so; but what we have in mind at the present time is the starting a society which shall be of a national character, and to which all these local or district ones—at least such of them as think it advisable to do so—may be affiliated. At the present time there is a vast amount of capital employed and floating about seeking for employment in the fruit-growing industry of this country, and it behoves its owners to seek for methods of combinations whereby it shall receive legitimate protection to prevent loss or depreciation as far as it is in human power to do so, or at least, when they do occur, to confine them within the narrowest possible limits. Presuming that a National Fruit Growers' Society is brought into existence forthwith, we can quite conceive that some persons will say the time is not yet ripe for such a thing—what will its functions consist

of, and in what direction will it seek to do good by looking after the interests of its members?—are questions which all shrewd and common-sense persons will ask themselves before giving a subscription towards its support, or before fruit growers themselves will consent to have their names proposed as members.

"We will endeavour to answer these questions, and also to enlarge upon them, for it is only by such pithy points being put in a clear light that such a society as we are now advocating can ever hope to be established on a firm basis, or to become permanent, and of an increasingly popular character. In the first place, the society should hold an annual meeting of members for the reading of papers on matters connected with fruit growing, and others treating on the economic aspect of such questions as may be expected to crop up from time to time in regard to our fruit growing industry; the reading of each paper to be followed by a discussion; in fact, to put the matter in other words, the meetings should take the form of an annual Conference, and there cannot be the slightest doubt but what great good will result. Secondly, the society should be able to command the services of a qualified horticultural or agricultural chemist, so that any member by paying a small fee could obtain a chemical analysis of soil or manure at any time he wished for such information; and with the table of analysis there should be a few remarks stating what chemical properties will benefit the said sample of soil, and also what value can be attached to the manure for fruit growing purposes. This matter is one of very great importance, and it is a strange fact that no horticultural society of the present day, so far as we are aware, employs an analytical chemist for this purpose, and any fruit grower, be he a private gardener or a man working on his own capital, wishing to obtain such information, must do so through an Agricultural Society, or by paying a large private fee, the amount of which acts as a deterrent to men of small means. We believe that thousands of pounds are lost annually over artificial manures owing to a want of more knowledge on the subject by those who use them. Thirdly, the society should issue a Journal yearly or half-yearly, in which should be given in tabulated form statistical information relative to importation and exportation of fruit in its various forms, *i.e.*, dried, bottled, jams, and in green or ripe condition. Such a matter as this is also of the greatest importance to fruit growers, and as the fruit growing industry develops itself it will manifest itself in an intensified degree. Indeed it is becoming daily more apparent that we have been exceedingly lax and neglectful of such an important source of information, but the opinion is now fast gaining ground, that it stimulates the business capacities of men with the best brains, and contributes largely to the levelling-up of inequalities where they exist. In addition to such information as this, the society's Journal should contain a limited number of contributions from some of its leading members, on subjects immediately connected with the fruit-growing interests—not necessarily on systems of culture—but mostly on the broader questions—such, for instance, as improved methods of fruit transit and distribution, drying, storing packing, and marketing of fruit, with others again relating to tithes, rates and taxes, in so far as they affect owners and occupiers of fruit farms and gardens. Of these latter questions some persons may think that they are already well understood, unalterable, and fully accepted; but on that we differ in opinion, and we think it will be found that, when the new elective County Councils come into force and get settled down into working order, there will be a very great deal in this respect that will require to be closely looked after. Having pointed out the directions in which the work of a National Fruit Growers' Society lies, the next question is as to management and putting it into working order. The latter part of the question may be answered, first, by saying that we know of no better plan than for the leading market-growers attending the Conferences to join hands and make arrangements to

FIG. 33.—ARAUJA GRAVEOLENS: STOVE CLIMBER: FLOWERS WHITE, FRAGRANT.

convene a general meeting, to which all who are interested in the project be invited to attend, with the object of discussing and taking the matter into earnest consideration. As regards management, we are of opinion that this need not be a costly affair—an office and meeting room could easily be rented, but the life and soul of the society, we think, will be found in the services of a thoroughly competent man as paid Secretary. There should be an Honorary President, Vice-Presidents, and a Council or committee of from seven to twelve members, elected by votes of course—one third to retire annually and not to be eligible for re-election under a period of three years; this would insure a constant infusion of new blood, in itself a matter of great importance to a society of this kind. One of the rules of this society should be worded in very precise language regarding the class of men who are to form the committee, and who in our opinion ought to be *bona-fide* market or trade growers only; this will give stability to the society, and gain the confidence of those members who have most benefit to expect from its labours. The committee should hold periodical meetings—say quarterly—to discuss business matters in connection with the society, and points of importance that may be expected to crop up regarding the fruit growing industry, and on which it might be thought the society could take action. Various other matters touching the interests of fruit growers could also be dealt with, but, as they are questions of detail we can hardly refer to them here further than say, they will force themselves to the front in the near future. It seems almost superfluous to add, that with a Minister of Agriculture, the voice of such a society would have great weight on all questions of a public character bearing on the interests of fruit growers."

**ARAUJA GRAVEOLENS** (fig. 33).—This is a stove climber (native of Brazil) of great beauty, closely allied to the well known *Stephanotis*, and which may be grown in like manner, and used for similar purposes. It is perhaps best known as *Schubertia graveolens*, under which name it was figured as long ago as 1838 in the *Botanical Register*, vol. xxxii, t. 21, and *Botanical Magazine*, t. 3891. Another name for it is *Physianthus graveolens* or *P. auricomus*, while it is very closely allied to the *Schubertia grandiflora* of MARTIUS. In the standard work of BENTHAM and HOOKER, *Genera Plantarum*, ii., 751 (1876), both *Physianthus* and *Schubertia* are included under *Arauja*, on which account we have here adopted the name *Arauja graveolens*. These are points, however, which must be left to the botanists to settle. For gardeners it may suffice to say that it is a very free-flowering stove climber, the stems of which are covered with reddish spreading hairs, the leaves are also softly hairy; the flowers are in umbels, white, waxy, and thick in texture. For the rest, our illustration tells its own tale. We saw the plant lately beautifully in flower in the garden of Mr. BARTHOLOMEW, at Reading, as also in the Water Lily-house at Kew. Our illustration is from a plant grown by Mr. DAVIDSON, of Wernoleu, South Wales.

**THE LATE MESSRS. T. JACKSON & SON'S NURSERY.**—Full of kindly observations was Mr. GEORGE FIELD MORRIS (PROTHEROE & MORRIS, 67 and 68, Cheapside), when he offered on Thursday, August 30, at The Mart, Tokenhouse Yard, London, the well-known and valuable freehold and leasehold properties, formerly belonging to Messrs. T. JACKSON & SON, both of whom are now dead. Interest was naturally excited among Kingstonians, and Alderman G. C. SHERRARD, J.P., was present as, it was understood, the solicitor representing the family. The auctioneer said the first offer was for the whole of the property in its entirety, but it did not sell. The auctioneer then put up Lot 1, freehold property, known and distinguished as the Kingston Nursery, Kingston, Surrey, most favourably situated in the heart of the town, and possessing a commanding frontage of 588 feet 6 inches to Fife Road, and 107 feet to Clarence Street, or thereabouts, and con-

taining a total area of about 1 a., 2 r., 31 p. The first lot was knocked down to Mr. NATHANIEL SMITH (SMITH BROS., Kingston) for £4000. Lot 2, the freehold family residence known as and being Fife House, Fife Road, Kingston-on-Thames, was withdrawn, the last bid, £1780, not being considered sufficient. Lot 3—the house, shop, and premises, known as No. 13, Thames Street—excited keen competition between Messrs. NUTTALL (ALFRED & WILLIAM) and J. J. HOLLAND, but the latter would not be outdone, and he gave £3900 for the shop and premises. Other lots were unsold. The auctioneer announced that the sale of the greenhouse plants would be proceeded with at once.

**GARDENERS' ORPHAN FUND.**—We have the pleasure to announce that at the flower show, held at Heckfield Place on August 28, Mr. WILDSMITH, the local secretary for this district, collected the handsome sum of £5 from three boxes.

**PRESENTATION OF AN ADDRESS TO PROFESSOR BENTLEY.**—The prolonged and valuable services rendered by Professor BENTLEY to the Royal Botanic Society of London have recently been the subject of a well-deserved recognition in the shape of a beautifully illuminated address presented to him on behalf of the Council of that Society. The text of the address was as follows:—

"Royal Botanic Society of London,  
"Gardens, Regent's Park.

"To Professor ROBERT BENTLEY.

"Sir,—At a meeting of Council this day, I was requested to convey to you, which I do with sincere pleasure, the cordial thanks of the Council and Fellows of the Royal Botanic Society of London for your able assistance in its objects by the Botanical Lectures you have during the past thirty-five years delivered in the Society's Gardens.

"Permit me at the same time to express our fervent hope that on retiring from your more active labours you may for many years enjoy the prospect of the valuable results of your prolonged and laborious work.

"FRANCIS, Duke of Teck, President."

**GARDEN FETE.**—The beautiful and historical grounds of Oakley Park, near Scole, Norfolk, were thrown open to the public on the 21st ult., the occasion being a garden party in aid of the Gardeners' Royal Benevolent Institution. The *fête* on Tuesday was organised by Mr. McMILLAN, the head gardener at Oakley Park, and so perfect were the arrangements that there was but one condition—fine weather—to make the affair successful. Unfortunately this was wanting, rain fell almost incessantly. Soon after mid-day, however, the sky cleared, and as soon as there was a prospect of the afternoon being at all fine, people were to be seen wending their way to the park. Visitors to the *fête* on Tuesday found many objects of interest in the house and grounds so closely identified with the name of the late owner. The gardens, now in their summer beauty, were a great attraction. The upper terrace commands an extensive view of the park and the river running through it. The kitchen garden covers about two acres, and a tour of inspection solves the problem why vegetables exhibited from this quarter distance all others at local shows. There is a long range of glass, and the houses are filled with fruit. We understand that, in spite of the wretched weather, a profit of £18 was made—a welcome addition to the funds of the Institution. Mr. McMILLAN's success should stimulate others to do likewise.

**WIGTOWNSHIRE HORTICULTURAL SOCIETY.**—The annual show of this Society was held on August 31, in the Academy, Stranraer, and sustained its reputation as a provincial show. Roses, Dahlias, Carnations, and other cut flowers, were shown in excellent condition, and greenhouse plants were exceptionally fine. Fruit made a large display, Grapes being well bloomed and highly flavoured. The vegetables were likewise good generally. The collections shown for the special prizes offered by

Messrs. Sutton & Sons, Reading, and Messrs. Dicksons & Co., Edinburgh, were of remarkably good quality. The bouquets of cultivated and wild flowers were numerous and meritorious.

**BIRMINGHAM GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—A notable event in connection with the above Association took place on Monday, August 27, when a party of about seventy members left Birmingham at 5:40 A.M., and arrived at Reading at 8:30 A.M. The party was met at the station by members of the firm of Messrs. SUTTON & SONS, who had provided conveyances to take the whole of the party to the trial grounds of the firm, and to their London Road nursery, and thence to the Lecture Hall, where the firm had provided dinner for the party—Mr. MARTIN JOHN SUTTON presiding, ably supported by Mr. LEONARD SUTTON, Mr. W. WILDSMITH, and Mr. W. B. LATHAM, Chairman of the Gardeners' Association. The journey to Heckfield (9 miles) was made from Reading by road. Here, after a kind reception by Viscount EVERSLEY and his daughter, the party was conducted round the place and shown everything of interest in these extensive and admirably kept gardens. The return journey was made from Reading at 7:30 P.M., Birmingham being safely reached at 10:5 P.M.

**POTATO TUBER SPROUTING IN DARKNESS.**—A correspondent sends us a fine specimen of an "Imperator" Potato, which had been laid aside in a cupboard, and in due time started into growth, bearing numerous shoots of coral-like appearance, the tips of which are, in many cases, developed into small tubers. All these shoots and tubers had of course developed at the expense of the old tuber, which endeavoured to do above ground what it could have done so much better below. Our correspondent rightly says a similar specimen was sent to Dr. LINDLEY some years ago (it is probably the one figured in his *Elements of Botany*); but to attribute to this distinguished botanist the statement that the "roots of the Potato are underground branches, and the tubers its fruit," is an astounding misrepresentation.

**"DAMPING-OFF" OF SEEDLINGS.**—The following extract is taken from an important and valuable series of articles from the pen of Professor MARSHALL WARD, now appearing in *Nature*, relating to the diseases of timber:—

"In the seed-beds [Beech is specially alluded to] it is often first noticeable in that patches of seedlings here and there begin to fall over, as if they had been bitten or cut where the young stem and root join at the surface of the ground: on pulling up one of the injured seedlings the 'collar,' or region common to stem and root, will be found to be blackened, and either rotten or shrivelled, according to the dampness or dryness of the surface of the soil. Sometimes the whole of the young root will be rotting off before the first true leaves have emerged from between the cotyledons; in other cases the collar only is rotten or shrivelled, and the weight of the parts above ground causes them to fall prostrate on the surface of the soil; in yet others the lower parts of the stem of the older seedling may be blackened, and dark flecks appear on the cotyledons and young leaves, which may also be turning brown and shrivelling up.

"If the weather is moist, e.g., during a rainy May or June, the disease may be observed spreading rapidly from a given centre or centres, in ever-widening circles. It has also been noticed that if a moving body passes across a diseased patch into the neighbouring healthy seedlings, the disease in a few hours is observed spreading in its track. It has also been found that if seeds are again sown in the following season in a seed-bed which had previously contained many of the above diseased seedlings, the new seedlings will inevitably be killed by the 'damping-off.' As we shall see shortly, this is because the resting spores of the fungus re-

main dormant in the soil after the death of the seedlings.

"In other words, the disease is infectious, and spreads centrifugally from one diseased seedling to another, or from one crop to another; if the weather is moist and warm—'muggy,' as it is often termed—such as often occurs in the cloudy days of a wet May or June, the spread of the disease may be so rapid that every plant in the bed is affected in the course of two or three days, and the whole sowing reduced to a putrid mass; in drier seasons and soils the spread of the infection may be slower, and only a patch here and there die off, the diseased shrivelling up rather than rotting."

**HORTICULTURAL SHOW AT LOSTOCK, NEAR BOLTON.**—The fifteenth annual floral and horticultural show for the districts of Westhoughton and Lostock was held on the 1st inst. at the "Black Horse," in the latter town. The prizes offered were numerous and well assorted, consisting chiefly of domestic articles. The exhibits were acknowledged to be better than the specimens submitted at previous shows. Vegetables brought numerous entries, there being an extraordinary show of Celery, for which forty-seven prizes were offered.

**FLEETWOOD FLOWER SHOW.**—The first annual show in connection with the Fleetwood Floral and Horticultural Society was held on August 31, in the Queen's Hall. The number of entries for the various classes was 548, and the display was a very creditable one, considering the exceptionally bad season we have had. The gardeners' class for plants in pots produced some fine exhibits, the Pelargoniums, Fuchsias, and Ferns shown being in fine condition, with a profusion of bloom. Mr. F. H. LUCAS was the principal prize-winner in this section, whilst Mr. J. LISTER ran him close. The show was well attended, and the committee have reason to hope for better things next year.

**THE BOTANIC GARDENS, TRINIDAD.**—When Mr. HART, scarcely more than a year ago, assumed the superintendence of the gardens, he found them in rather a backward and dilapidated condition. An interregnum of twelve months had intervened between his appointment and the retirement of his predecessor, and during that time the gardens had been under the superintendence of a clerk from the island Audit Office. The work was done as well as could have been expected; still many things were out of order, and many improvements had instantly to be made. Mr. HART set vigorously to work, and with the efficient co-operation of his Excellency Sir WILLIAM ROBINSON, K.C.M.G., he has been able to do wonders. We admire his courage and his ability, and we sincerely wish him all success in his important labours.

**LILIES AND POPPIES.**—Mr. WARE sends us a magnificent combination—a sheaf of *Lilium auratum* and one of *Oriental Poppies*. Mix the two judiciously, and what vase shall be grandiose enough to contain so stately a group? But it is our business to analyse, and not merely to gaze in admiration. The forms sent are forms of *Lilium auratum* var. *platyphyllum*, which, Mr. WARE tells us, has larger flowers, broader overlapping segments, and larger leaves than in the common type. Among the flowers are some with a pure white unspotted segment, marked by a central band of light gold (var. *virginale*). A spotted form is represented by the var. *macranthum*. In addition, there is a red-banded variety (*rubro vittatum*), in which the band is broader and deeper than in the ordinary red-banded *auratum*. The *platyphyllum* varieties, Mr. WARE tells us, make huge bulbs, and grow in almost any soil, while the original *auratum* fails to grow with Mr. WARE in any position or soil. The *Oriental Poppies* are flowering a second time. Gorgeous used to be the appropriate word for these, and still is for some; but Mr. WARE has lately brought under notice some forms of a pale rosy-lilac colour, so that we have now a range of colour from pale lilac or pink through orange, orange-scarlet,

scarlet, to deepest crimson, the base of the petal in every case marked with a deep black-purple spot.

**THE NATIONAL FOOTPATH PRESERVATION SOCIETY** is making itself felt throughout the kingdom—rousing people to the great importance of preserving rights of way both on land and water. Many of our readers have heard of the two great successes that the society has lately achieved—one in resisting the Great Western Railway Company preventing the people of a considerable district having access to their market town, Neyland (Pembrokeshire). The other case was a right to walk on the tow path of the Grand Junction Canal Company, which right was proved to have existed for a long period, but had been subsequently stopped by the company. This also was gained. Who can estimate the value of the rights of way in these two cases alone? We cannot find space to recount all the matters now before the Society. It seems almost as if all England was going mad stopping footpaths and cribbing roadside slips of land, but in truth this has been going on for years unchecked until this useful Society was formed four years ago, and the people should strengthen the hands of the Society by becoming members. The minimum subscription is 5s. a year; the London office is 42, Essex Street, Strand; and Mr. ALLNUTT the Secretary.

**NATIONAL CHRYSANTHEMUM SOCIETY.**—A largely attended meeting of the committee took place at Anderson's Hotel, Fleet Street, E.C., on the 3rd inst., Mr. E. SANDERSON, President, in the chair. The minutes of the last meeting having been read, an interesting letter was read from the Secretary of the Victorian Horticultural Association, Melbourne, and a deputation from that Society had subsequently called upon Mr. W. HOLMES for information as to the working of the Society. The following societies were admitted into affiliation, making four in all:—The Barnsley, Hamstead, Isle of Sheppey, Stroud (Gloucester), and Truro. Mr. G. T. MILES, Wycombe Abbey, Bucks, was appointed one of the judges of fruit and vegetables at the November show at the Royal Aquarium, in the place of the late Mr. JOHN WOODBRIDGE, and a vote of condolence was ordered to be sent to the family of the latter. The Secretary reported that all the preliminaries of the provincial show at Sheffield had been satisfactorily arranged, and there was every reason to believe it would prove highly successful. Two new Fellows and forty-eight new members were elected. The Secretary, regretting the unavoidable absence of the members of the Catalogue Revision Committee, said the publication of the revised catalogue was in a very forward state, and he hoped copies would be in circulation before the show on September 12. The cost of the new catalogue would be about £30; already eighty copies were ordered, and it was believed that the advertisements in the catalogue would more than cover half the cost of publication. The schedule of prizes for the first provincial show at Sheffield on November 16 was laid upon the table, also that of the Barnsley Chrysanthemum Society. The proceedings closed with a cordial vote of thanks to the Chairman.

**BISHOP'S STORTFORD HORTICULTURAL SOCIETY.**—The summer exhibition took place as usual in the grounds of The Grange, the residence of T. J. MANN, Esq. The competition is mainly confined to amateurs and cottagers, and a good display resulted, especially in the classes for cut flowers and vegetables. The Hon. Secretary of the National Dahlia Society, Mr. HENRY GLASSCOCK, was to the fore with Dahlias, and, considering the heavy storm which swept over the district on the previous evening, doing a great deal of damage, and flooding many gardens, it is indeed surprising that flowers were so good. Plants were small, but clean and bright. Fruit was limited in quantity. A good collection, not for competition, came from Mr. E. ATKINS, gr. to the Misses PULTENEY, Stanstead; also an admirable group of plants, arranged with great taste; a group of plants from W. A. BLITHE, Esq., Croft

House, Stanstead; a large collection of cent blooms of hardy plants, Dahlias, &c., from Messrs. PAUL & SON, Old Nurseries, Cheshunt; Balsams and Roses, from Messrs. T. RIVENS & SON, nurserymen, Sawbridge-worth; Golden Champion Grapes from The Grange gardens, &c. The cottagers' produce from the allotment gardens was remarkably good throughout.

**LARGE DECIDUOUS CYPRESSES.**—In the grounds of J. C. RAPHAEL, Esq., Castle Hill, Englefield, are three specimens of *Taxodium distichum*, which may be regarded as remarkable ones in this country. The trees stand by the edge of a deep pool of water, and the ground around, and more especially the very angle of the bank nearest to the water, is covered by woody protuberances which emerge from the roots of these trees, some of which are 2 feet in height. The largest tree measures about 3 feet 6 inches in diameter at breast height, and is about 70 feet in height. The others are somewhat smaller, but still stately trees. The boles of all of them appear of remarkably stout proportions, not spindling much as they ascend, and the branches appear of disproportionately small dimensions. Our old correspondent, Mr. W. SWAN, has charge of the gardens at Castle Hill, but his attention will not be so exclusively given to Orchids, although there exists the nucleus of a choice collection—as in some other gardens of which he has had the charge.

**CHRYSANTHEMUM SHOW FIXTURES.**—The annual exhibition of the Pembrokeshire Chrysanthemum Society is fixed for November 9 and 10, and that of the Winchester Horticultural Society on November 13 and 14.

**THE NEILL PRIZE.**—At a meeting of the Royal Caledonian Horticultural Society, held in the Waverley Market Hall, Edinburgh, on Wednesday, September 5, the Council of the Society presented the Neill Prize—amounting this year to £40—to Professor BAYLEY BALFOUR, of Edinburgh, well known for his travel and researches in Socotra, whence he introduced some remarkable plants into our gardens. The late Dr. NEILL left to the Society the sum of £500 for the purpose of the interest being applied in furnishing a medal or other reward every second or third year to any distinguished Scottish botanist or cultivator, to be voted by the Society. The practice has been to allow the interest to accumulate for two or three years, and then vote it as a money prize.

**SCOTTISH HORTICULTURAL ASSOCIATION.**—The monthly meeting of this Association was held last night at 5, St. Andrew Square, Edinburgh, the President, Mr. ALEXANDER M'KINNON, Scone Palace Gardens, in the chair. There was a large attendance. Seven gentlemen nominated at last meeting, including Professor BAYLEY BALFOUR, were admitted members. Mr. DONN, Dalkeith, drew attention to the Fruit Conference held last week at Dunkeld, and suggested that steps should be taken towards the formation of a pomological society, or a pomological branch in connection with the Association. All would agree, he thought, that there was great room in Scotland for such an organisation. He hoped something definite would be done before the coming winter set in. Mr. MACKENZIE, Warriston, Mr. GRIEVE, Pilrig, Mr. MILNE (Messrs. JAMES DICKSON & SONS), having spoken in favour of the formation of a pomological branch, the Secretary, Mr. ROBERTSON M'NEBO, in seconding the motion, said that while he did not in any way deprecate taking steps on the lines suggested, he did not think their Association should take up the matter exclusively for fruit. The holding of excursions such as that to Dunkeld Gardens, had been referred to, but he thought if these were of benefit to those interested in fruit culture they would be equally interesting to others having a liking for other departments of horticulture. After some further conversation the motion was adopted unanimously. Mr. TOM, 74, Maitland Street, read a paper by Mr. MATTHEW SMITH, Prestwick, Ayrshire, on the culture of

Gladioli. Some discussion took place on the paper, and at the close it was resolved that the thanks of the Association be communicated to Mr. SMITH. Among the exhibits were twenty-four specimens of a new seedling Carnation, Maggie Laurie, of a pale pink colour, forwarded by Messrs. DICKSONS & CO. A fine collection of blooms of *Gloxinia* was shown by Mr. JOHN CLARK, Links Place, Leith. Mr. FRASER (Messrs. METIVEN & SON) exhibited a cluster of Damson Plums and samples of Hops which he had brought from Kent the other day.

## NOVELTIES.

The following new plants are announced for the first time in Mr. W. Ball's Catalogue, where descriptions may be found:—

*Aglaonema picta compacta*, stove Aroid.—Java.  
*Alocasia marginata*, Brazilian Aroid—stove foliage plant.

*A. princeps*, Malayan Aroid—stove foliage plant.  
*Apelandra amena*, Brazilian Acanthad—stove foliage plant.

*Ardisia polyccephala*, East Indian shrub—leaves red when young; berries black.

*Crotons Delight*, Junius, Magnificent, Monarch, and Victory.

*Cypripedium Saundersianum* = *C. caudatum* × *Schlimi*.

*Dracena argenteo-striata*, South Sea Islands; leaves linear, streaked with creamy-white.

*Eomecon chionantha*, a Chinese Papaverad—half hardy perennial.

*Esmeralda bella*, Orchidaceæ. See *Gardeners' Chronicle*, February 4, 1888.

*Mussaenda erythrophylla*, Congo—stove shrub; bracts scarlet.

*Nidularium striatum*, Brazilian Bromeliad.—Leaves white, variegated.

*Panax crispatum*, lepidum, nitidum, ornatum—all Brazilian forms.

*Pavetta natalensis*; stove shrub.—Natal.

*Pinanga lepidia*, East Indian Palm.

*Rhododendron* (greenhouse) *Diana* and *Fair Rosamond*.

*Gloxinias Alpha*, Casino, Lucrece, Sabina.

*Pelargonium* (spotted) *Argus*, *Rubis*.

## FOREIGN CORRESPONDENCE.

### NANCY.

At all times a visit to these gardens is to the horticulturist a source of much and instructive enjoyment, Nancy being the birthplace and home of many of our choicest and best florist flowers, is, as it were, the "Mecca" of gardeners. But at the present epoch of gardening, when various sections of florist flowers have reached a point of perfection which a few years since would have been considered unattainable, a visit is of more than ordinary interest. Not to mention more than hybrid Gladioli and Tuberous Begonias, the amateur can imagine what a field of interest lies before him, these alone being sufficient to repay one for a visit to Nancy.

The grower of Tuberous Begonias finds at the garden of M. Crousse a superb series of seedling double Begonias; the double white and double yellow of various shades are as yet unequalled in any other establishment. The size, perfect form, and habit of many of these magnificent flowers leave nothing further to be desired. Some of the seedlings raised this year are absolutely perfect, and make one long for the day when they will be found in the Catalogue of M. Crousse. At this garden the Ivy-leaved *Pelargoniums* also are very noteworthy. Amongst those to be sent out by-and-by are several of great promise. The *Cannas* raised by M. Crozy, of Lyons, are largely grown in this garden; but in our climate they will be more generally useful for indoor culture, owing to want of continued sunshine and heat to develop them fully. (An instance of this can now be seen by any visitor to the nursery of Messrs. Cannell, at Swanley.)

At the nursery gardens of M. Lemoine the great point of interest is the new race of hybrid Gladioli, a beautiful cross between *Gladioli Saundersii* superbus and M. Lemoine's hybrids, made known on the exhibition table by Messrs. Veitch. Only one who has seen these exquisite flowers can have an idea of what is in store before very long for growers of hybrid Gladioli. The form, size, and markings, are

quite surprising—and reveal a beauty hitherto unknown amongst *Gladioli*. It is possible that one or two may appear in the Catalogue for next year, if on lifting them a sufficient quantity to put them into commerce is found to exist.

The herbaceous Phloxes contain many seedlings of wonderful size and beauty, many new shades of colour being found amongst them.

The new *Montbretias*, too, contain some seedlings of very much improved form and colour, and as they increase so rapidly one may expect very soon to find them attainable.

Having visited and carefully examined both these gardens last autumn, I was not prepared to find such a number of interesting novelties this year. *John T. Poë, Riverston.*

## HOME CORRESPONDENCE

**TOMATOS ON SOUTH WALLS.**—I have myself observed, and have likewise heard complaints of the Tomato not fruiting well outside this season, but in this garden they have never done so well before. I have forty plants placed against a south wall, which are laden with good-sized fruits, which will, with four or five days' sun, be fit to gather in quantity, and I have, moreover, furnished the family with them for three weeks past. The reason I think is, that the border is narrow, rather steeply sloped, and the wall is high. The plants were raised early and potted on into 7-inch pots before being planted out, being well hardened off previously. The variety is the old Large Red, which I think is still one of the best for growing outdoors. *G. H. Merton.*

**THE POTATO CROP IN LINCOLNSHIRE.**—During the past week or so I have passed through many hundreds of acres of Potatoes, in fields and allotments in various parts of Lincolnshire, and was surprised to find a diseased patch quite a rarity. No doubt there are places where the disease has made its appearance though all the crops which have come under my notice were particularly free from it. The yield too is, where the earlier sorts are being lifted, very productive, exceeding that of last year greatly. With many growers a pinkish variety named *Abundance* is an especial favourite, while with others I found *Beauty of Hebron* placed first on the list. These varieties are grown more frequently in allotments than in fields; in the latter the *Magnum Bonum* is considered to be unsurpassed, especially in some parts of the Fens, and it is particularly good, both as regards quantity and quality, but in other parts it is comparatively worthless. *York Regents* and *Champions*, though these are grown by some, are by no means so popular with the Potato farmers here as they are farther north. Another point I noticed was the uncommonly strict attention that is paid as to the destruction of weeds. With many of the Potato farmers in Lincolnshire it is the rule to cut off the haulm as soon as the tuber is matured, thus allowing the land to dry before the crops are lifted. *C. Collins.*

**CENTAUREA AUREA.**—The *Gardeners' Chronicle* has always done good service in searching out a lost plant. A fortnight ago I wrote to inquire whether anything is known about *Centaurea aurea* (Aiton), figured and described in *Bot. Mag.* vol. xii., t. 421. The reply given, signed "D. D.," was to the effect that it is a good species, but that only one dried specimen is known to exist, viz., in the Kew Herbarium, labelled *Port Juvenal*, and that no habitat or living specimens are known. This week, under "Names of Plants," p. 251, I observe that "R. C. K." is credited with having sent a specimen to be named which is *C. aurea*. It is tantalising not to be named which it is, where it came from, and whether it is a live plant or not. I have tried to hunt out all that is known of *C. aurea*. I find it in Miller's *Dictionary* described as "cultivated by Mr. Miller, in 1768. Calyxes most simply thorned; thorns spreading; lower leaves pinnatifid" (reference to Aiton's *Hort. Kew.*, 3, 265). In De Candolle's *Prodromus*, vol. vi., p. 595, I find this description repeated with a reference to *Bot. Mag.*, 421, and to Sweet's *Hort. Brit.*, 217: *Crocodylum aureum*. I have not verified the last reference as I have not the book. De Candolle adds: "All plants under this name in gardens were obvious mistakes (*obvia errant falsa*)."

I am afraid this last sentence is true still. A few years ago *C. glastifolia* was distributed from a well-known nursery as *C. aurea*, to me amongst others.

The name *C. aurea* is not included in Nyman's *Conspectus of European Species*, and I should be glad to know where "Port Juvenal" is. The most obvious character of *Bot. Mag.*, t. 421, is the long spines projecting outwards from the end of the involucre bracts. Besides the mention of *Port Juvenal* with the Kew specimen I can only find South Europe given as a habitat in Miller and *Bot. Mag.* De Candolle does not give any habitat. *C. Wolley Dod, Edgely Hall.*

**DISEASE OF POTATOS AND MANGELS.**—The fungus of the Potato disease has lately spread with alarming rapidity, and few Potato patches are now without it: its effect will doubtless be seen on late Potatos. In Glamorganshire, Carmarthenshire, and Cardiganshire, it is working great mischief, and most of the South Wales Potatoes growers say the crop is "bad," "very bad," or "blasted." Although so much has been written on the subject many growers are still unacquainted with the early state of the disease; as first seen on the leaves; as a rule no precautions seem to be taken to mitigate attacks. Mangels are in many places afflicted with *Peronospora effusa*, a close ally of the Potato fungus, and unless the attack is unusually virulent farmers seem to be paying but little attention to this, one of their most deadly enemies. As Mangels are not earthed-up they are fully exposed to the attacks of the spores of the fungus and the disease will be seen when the crops are lifted. *Peronospora effusa* does not generally grow on Mangels, it prefers Spinach and the wild species of *Chenopodium* and *Polygonum*. For an illustration and description see *Gardeners' Chronicle* for April 3, 1883. The *Peronospora* of Lilies seems to have spread all over the country, and garden and wild Poppies are being mown down in thousands by *Peronospora arborescens*. The wet summer seems to have given renewed vitality to all species of *Peronospora*. *W. G. Smith, Dunstable.*

**BOUVARDIA PRESIDENT CLEVELAND.**—It rarely occurs that a plant of such sterling merit as the above comes into commerce with so little ceremony as did this beautiful scarlet *Bouvardia*. On first seeing it I was much struck with its beauty, and on comparing it with other varieties my first impressions were fully confirmed. I found, too, that others were not so fully cognizant of its merits, and it was so much in demand that the saleable stock was soon exhausted. I have no doubt that many are ignorant as to whom belongs the credit of introducing this *Bouvardia*, but I believe it was brought from America by Messrs. Low & Co., and first distributed by them last autumn. It was put before the Floral Committee of the Royal Horticultural Society by Messrs. Veitch & Sons, and obtained a First-class Certificate, and much admiration from all who saw it; and I should say that it is destined to become one of the most popular of this beautiful class of plants. *A.*

**PEACH ALEXANDER.**—With reference to a paragraph in your last issue, headed "Alexander Peach," I have to say that it is earlier than *Early Louise* or *Beatrice*, as grown in pots in the same house here. It is quite distinct from *Hale's Early*, being a clingstone. *Will Taylor, Hampton.*

**EXHIBITING VEGETABLES.**—*Habitants* of our horticultural gatherings have doubtless noted the increased attention that has been paid of late years to the staging of the products of the kitchen garden. Whereas formerly it was rare to find taste in arrangement displayed, it is now a pleasure to look upon the exhibits. And in this new departure exhibitors are but studying their best interests, for taste in arrangement combined with quality in the exhibits, will always score a point with the judges. My attention was drawn to this matter by observing Mr. Lambert's collection of vegetables at the recent show at Shrewsbury. This collection, which secured the medal of the Society, was arranged on a stand 4 feet wide and 7 feet long, with a joint running lengthways to admit of the back and narrowest division being tilted up to suit the different vegetables staged. The tray was then filled with soil and planted all over with *Selaginella*. Eight places were left for eight dishes to fit into (the back four vegetables not in dishes). These eight dishes were shaped to suit the different vegetables, and planted with *Selaginella*, so that when the dishes were fitted into the tray it formed one mass of moss, exactly the shape wished for, to put the different vegetables on. All round the outside, and hanging down, was *Panicum*, giving the exhibit quite a graceful appearance—blocks of wood cut wedge-shape and pushed

under from the back, raising the two divisions of the tray to the exhibitor's taste. It was an arrangement that caused Mr. Lambert a lot of trouble, but, as he somewhat significantly remarked to the writer, "I want to get the Veitch Memorial Medal!" and he succeeded. Fine in quality, as were his different dishes, his tasteful arrangement was of no little assistance when the crucial moment for judging arrives. *B.*

**GENTIANA ASCLEPIADEA.**—In your issue for August 26, "C. E. F." enquires respecting the propagation of the above. To the first question of your correspondent, viz., Can this plant be propagated from cuttings, and if so, what is the proper time for striking? I reply, Yes, it may be propagated from cuttings, taken off in early spring when the fresh growths are pushing forth, and about three or four inches long, detaching them with a heel from the old stool. But while this may be done with success, it is only to be recommended in cases where large plants exist, for I would have your correspondent bear in mind that for every cutting thus taken, a flower-stem and flowers are sacrificed. The cuttings may be inserted in sandy soil, and covered by a bell-glass or handlight, keeping them well shaded. The best way of raising a stock of this and most *Gentians* is by seeds, and though extremely slow to vegetate in the majority of cases, the patient waiting is now and again fully rewarded with a good batch. In sowing seed two things are essential—these are, never to allow the seeds to become dry by exposure previous to sowing, and always to keep them moist after being sown. *E. Jenkins.*

**EUCHARIS AMAZONICA.**—We hear much of the mite, and other signs of failing health of this plant in many gardens, and at the same time of many nostrums to cure these ills, that it was quite a treat to see a perfectly healthy lot (a houseful) of *Eucharis* at Luton Hoo Gardens. Before the arrival of Mr. W. M. Baillie at Luton Hoo the *Eucharis* had got into bad health, but under his direction the plants soon began to mend. His method is simplicity itself. The plants are kept steadily at a temperature of 75°, and are always growing—no resting period—and they flower three or four times yearly, producing both large flowers and foliage. The plants, which are in large pots of various sizes, are watered once a week regularly, and syringed twice daily in summer-time. *M. W.*

**HEAVY RAINFALL IN THE LAST WEEK OF AUGUST.**—The rainfall at Llandilo, in Carmarthenshire, from Wednesday, August 22, at 6 a.m., to Thursday, August 30, at 6 a.m., amounted to 3.37 inches, viz.:—August 23rd (Thursday), .30; 24th (Friday), .20; 25th (Saturday), .11; 26th (Sunday), .7; 27th (Monday), .37; 28th (Tuesday), 1.75 (rained in torrents for the twenty-four hours); 29th (Wednesday), .36; 30th (Thursday), .12; total, 3.37 inches. *T. Couburn, Dynevor Castle Gardens.*

## SOCIETIES.

### HARPENDEN HORTICULTURAL.

The show of this Society was held on Wednesday week (August 29) under most inauspicious circumstances.

*Plants.*—Two collections only were staged, both excellent, the 1st prize going to J. B. Maple, Esq., M.P. (gr., Mr. T. Nutting), Childwickbury, St. Albans, for *Erica coccinea*, *Clerodendron Balfourianum*, *Vinca oculata*, *Cassia corymbosa*, *Impatiens Hawkeri*, and *Allamanda grandiflora*. The 2nd was shown by P. Bosanquet, Esq. (gr., Mr. J. Turk), Pondfield, Little Berkhamsted, comprising *Plumbago capensis*, *Begonia fuchsoides*, *Habrothamnus elegans*, a fine specimen; *Stephanotis floribunda*, *Vinca oculata*, and *Lapageria rosea*.

For six foliage plants, distinct, three capital lots competed, premier honours being gained by J. B. Maple, Esq., M.P. (gr., Mr. T. Nutting), Childwickbury, who exhibited *Croton anacanthensis*, *Areca lutescens*, *Pandanus Veitchii*, *Croton Queen Victoria*, and *Areca* species. Two noble Palms, adding greatly to the effect of the central staging, were also shown by this exhibitor, not for competition. The 2nd prize was awarded to P. Bosanquet, Esq. (gr.,

Mr. J. Turk), for *Croton majesticus*, *Phoenix farinifera*, *Dracena metallica*, *Latania borbonica*, *Croton Youngii*, and *Cordyline australis*. An extra prize was given to a very worthy exhibit shown by J. S. Hill, Esq., J.P. (gr., Mr. W. F. Emptage), Hawkswick, St. Albans, for *Anthurium crystallinum*, a magnificent plant; *Croton Queen Victoria*, *C. antiochiensis*, *Phoenix reclinata*, *Asparagus tenuissimus*, and *Seafaritia elegans*.

**Groups of Plants.**—Racing the visitor on entering the principal tent was a meritorious group of plants, entered as an honorary exhibit from Sir J. B. Lawes, Bart., the President of the Society (gr., Mr. W. Olver).

**Ferns.**—Three sections were staged of almost equal merit, it being a most difficult matter to decide to which premier honours should be awarded. Eventually, Mr. W. F. Emptage was placed 1st, and Mr. T. Nutting, gr. to J. B. Maple, Esq., M.P., Childwickbury, 2nd. The 1st lot comprised *Microlepia hirta cristata*, *Gymnogramma chrysophylla*, *Adiantum Williamsii*, a beautiful specimen; *A. Farleyense*, *Nephrolepis exaltata*, and *Platycaurum alcinore*.

**Begonias.**—For special prize offered by Messrs. J. Laing & Sons, of Forest Hill, for three named tuberous Begonias, Mr. C. Sibley came 1st with some finely-flowered plants.

**Table Plants.**—This class, for twelve table plants in 6-inch pots, was well filled, the 1st prize being gained by Mr. T. Nutting, of Childwickbury.

**Cut Flowers: Roses.**—In the class for forty-eight cut roses, single trusses, of distinct varieties, Messrs. G. Paul & Sons, the Old Nurseries, Cheshunt, contributed a magnificent display of their choicest blooms, which would have maintained their ground in a much more extended competition, but owing to the preceding foul weather only two out of four competitors who entered in this class came forward.

Roses, not for competition, were contributed by Messrs. Cutbush, of Barnet, and contained some excellent varieties.

**Dahlias.**—Owing to the inclement weather the Dahlia classes did not fill satisfactorily; Messrs. G. Paul & Sons, Cheshunt, however, were conspicuous with twenty-four well-made blooms, which secured 1st prize. A very noticeable box of twelve varieties were shown by Mr. G. Arnold, of Leighton Buzzard.

**Stove, Greenhouse, and Herbaceous.**—In the class for twelve bunches stove and greenhouse cut flowers, distinct, Mr. S. Brown, gr. to Nevill E. B. Cox, Esq., J.P., Moat Mount, Mill Hill, had little difficulty in carrying off 1st prize with a choice lot of *Stephanotis floribunda*, *Lapageria alba*, *Ixora Williamsii*, *Rose Nipheto*, *Cattleya Leopoldi*, *Lilium auratum*, *Allamanda*, *Pancratium fragrans*, *Ageratum*, and *Eucharis amazonica*.

For twelve bunches hardy herbaceous cut flowers, distinct, there were seven entries, Mr. J. Henshaw, of Rothamsted Cottage, Harpenden, taking 1st, with magnificently grown and effectively staged examples of *Chrysanthemum latifolia*, *Geum coccineum plenum*, *Anemone japonica* var. *flor. albo*, *Trapaolum speciosum*, *Lathyrus latifolius* var. *albus*, *Rudbeckia speciosa*, sylv. R. Neumann, *Gypsophila paniculata*, and *Phlox decussata* var. *coccinea*. Dr. McLean, of Harpenden Hall, secured 2nd, with an admirable lot.

**Non-competing Exhibits.**—Messrs. W. Paul & Son, Waltham Cross, contributed a most interesting collection of cut flowers, of hardy herbaceous plants, Dahlias, and baskets of Roses, of every imaginable hue, the whole extending for some 25 to 30 feet along the side staging, an artistically arranged basket of *Lapageria rosea* and *L. alba* being especially fine.

**Fruit.**—The collections of fruit and individual dishes of the different sorts, were neither so plentifully shown nor so good in character as we have noticed on former occasions.

Mr. S. Brown, Moat Mount, Mill Hill, was 1st in the collection of eight dishes, and 1st in two bunches of black Grapes. Mr. T. Nutting, Childwickbury, secured 2nd in the collection of fruit, and 1st in two bunches of white Grapes and in a dish of six Peaches, this exhibitor taking Messrs. Wood's Silver Medal for the most meritorious exhibit in the fruit classes, grown by the aid of their Le Fruiter.

**Vegetables.**—The number of entries for the vegetable classes were the largest ever received by this Society. All were of capital quality, and those contributed by the cottagers, many of which came from the Rothamsted allotment gardens, the produce being such as would not disgrace any gentleman's garden. Correspondent.

## ROYAL CALEDONIAN HORTICULTURAL.

This Society held its autumn show in the Waverley Market, Edinburgh, on the 5th and 6th inst. The show, as compared with the average, may be described as a thin one, there being a falling off in the fruit entries, and in the furnishing exhibits which contribute so much to the attractiveness of these great shows. The entries were about 1400, being 400 under last year which was in excess of the average.

In fruit, Grapes were, as usual, a leading feature, the Lambton, Newbattle, and Melville Castle exhibits being grand examples. Pine-apples were more numerous, and of finer quality than usual. Other indoor fruits were of average quality, though lacking in quantity in some important sorts. Hardy fruit was scarce and poor. This was most noticeable in the case of Peaches, Nectarines, and Apricots. Plums were better in quality, yet inferior to the usual standard shown at these shows. Strawberries were good but scarce. Gooseberries were fairly good.

**Plants.**—About the usual number and quality of stove and greenhouse plants, and Ferns, and table plants were tabled. Of hardy plants there were few exhibited, the most noticeable being the collection put up at the west end of the Market Hall by Messrs. Ireland & Thomson, a most attractive group, comprising the finer types of Conifers and other ornamental evergreens—*Clematis*, *Roses*, *Hydrangea paniculata grandiflora*, with which were interspersed some fine greenhouse *Rhododendrons* and *Clethra arborea* in flower.

Messrs. Dicksons & Co. had a fine table of miscellaneous greenhouse and stove plants, along with exhibits of cut flowers of French Marigolds and border Carnations, and Roses and Pansies. Among the Carnations were a stand of blooms of their new self, "Maggie Laurie" a delicate rose coloured variety of large size and fine substance, which was awarded a First-class Certificate. Messrs. Methven & Sons had a very fine table of plants of miscellaneous characters, chiefly stove and greenhouse, tastefully set up.

Mr. John Downie, Princes Street, exhibited a table 30 feet by 6 feet entirely filled with tuberous Begonias of very superior quality, which formed quite a feature of the show.

Messrs. Munro & Ferguson, St. Andrew Square, exhibited a numerous collection of cut hardy flowers both annual and perennial, among which were notable *Arnebia echinoides* and other rare things among hardy perennials, and their new form of *Matricaria inodora* pleno named "Snowflake," which was awarded a First-class Certificate. The blooms are larger and purer in colour than those of the older form, and the plant is dwarfier, more compact in habit and equally floriferous with the latter sort.

Messrs. Laing & Mather, Kelso, exhibited cut blooms of Carnations and Picotees, among which was a stand of their new Carnation, R. H. Elliott, yellow ground streaked with crimson, a beautiful sort: awarded a First-class Certificate.

Mr. John Forbes, Buccleuch Nurseries, Hawick, had a very meritorious exhibit of Pentstemon, Antirrhinum Phloxes and Pansies, and the latter especially showing some very fine and distinct varieties.

Mr. Campbell, High Blantyre, tabled a splendid collection of choice Carnations and Picotees, Dahlias, and Hollyhocks, which were much admired.

Mr. Laing, gr. Salisbury Green, exhibited a fine plant of *Renanthera Lowii*, with spike of bloom composed of thirty blooms.

Messrs. Dicksons (Limited), Chester, had an interesting exhibit of hardy perennial cut flowers, among which was a new and beautiful border Carnation named Mrs. Reynolds Hole.

Messrs. Kerr & Son, Kalemouth, Roxburgh, exhibited some fine cut Hollyhocks; Messrs. Croll, Dundee, and Smith & Son, Stranraer, excellent Roses.

Turning to the competition lots, and taking Fruit first, the collection of twelve dishes, consisting of three dishes of Grapes, two of Peaches, and one each of any other sort except Pines and Bananas, brought only one lot, which was from Mr. Hunter, Lambton Castle. The Grapes were very fine, and there were some splendid samples of Marie Louise d'Uccle Pears and Worcester Pearmain Apples.

Eight dishes fruit, including Grapes, black and white, and any other description of fruit, brought a pretty numerous competition. Mr. Hunter was here again 1st, with splendid Grapes, Pears, Nectarines,

Pine, and Brockworth Pear as conspicuous features in the collection; Mr. McKelvie, Broxmouth, was a worthy 2nd.

In twelve dishes of hardy fruit, Mr. Fairgrieve had an easy 1st, with Hale's Early and Louise Peaches, Kirk's Plum, Orange Apricot, Pine-apple Nectarine, Jargonelle Pear, and Peasgood's Nonsuch Apple as the principal varieties in his collection; Mr. Law, Viewforth, Stirling, was 2nd.

Twelve dishes of orchard-house fruit brought Mr. Hunter again to the front. His collection contained some extraordinary samples of Pitmaston Duchess and Beurré Diel Pears, said to weigh each from 32 to 35 oz. He tabled also some excellent Queen Apple, Pine-apple Nectarine, and Coe's Golden Drop Plum.

A special prize, offered by Messrs. Thomson & Sons, Clovenfords, for eight bunches of Grapes, was taken by Mr. McHattie, of Newbattle Abbey, with a very superb lot, among which were some remarkable Duke of Buccleuch Madresfield Court, Black Hamburg, and Muscat of Alexandria. Mr. Mackinnon, Melville Castle, stood a very good 2nd, with Gros Maroc, Black Alicante, Muscat of Alexandria, and superb Golden Hamburg.

In the class of four bunches of Grapes, distinct, Mr. McHattie again took the 1st place with splendid Gros Colmar, Madresfield Court, Muscat of Alexandria, and Black Hamburg; Mr. Mackinnon coming well up with beautifully finished stuff; and Mr. Boyd, Callander House, Falkirk, was a close 3rd.

Class 7—two bunches of Muscat of Alexandria—was a prize presented to the Society by Convenor White, and was easily taken by Mr. McHattie, with splendid stuff; Mr. McKelvie was 2nd.

The next class, two bunches Black Hamburg, was again led by Mr. McHattie, with splendid samples, with Mr. Mackinnon a good 2nd. Competition was here keen, but all comers were distanced by the two leaders.

For one bunch of Muscat of Alexandria there were three entries; Mr. J. Green, Yester, took 1st prize easily; Mr. Caldwell, Ashley Bank, Langholm, being 2nd.

Class 12—one bunch Allwink Seedling—placed Mr. Boyd 1st, with a splendid sample; Mr. Murray, Park Hall, being a fair 2nd.

Pines were fully above average as to quality and about the usual quantity. Mr. McIndoe, Hutton Hall, Guisborough, staged the finest Queen; Mr. McIntyre, The Glen, Peebles, the best Smooth Cayenne, and the best pair of Pines.

Melons were a tolerable show, but nothing special in quality was exhibited. The prize-takers, Mr. A. Young, with Best of All, green-fleshed, and Mr. Wm. Laing, Wellfield, Fife, in the red-fleshed section, with an unnamed fruit.

Some excellent Peaches were shown, the best coming from Mr. McLeod, Brethart, Park, Stirling.

A bunch of Gros Maroc exhibited by Mr. McKenzie, Erisker Ledaig, was a special object of interest on account of the monstrous size of the berries. They were more like medium-sized purple Plums than Grapes.

**Plants.**—Tables arranged for effect, 20 feet by 5 feet, in the gardener's classes, brought two competitors—Mr. Grossart, Oswald Road, and Mr. Donaldson, Ormalie, Murrayfield. The former took 1st prize with a very tastefully got-up collection of fine well-grown plants. First honours in six stove and greenhouse plants were carried off by Mr. John Paterson, Millbank, with his usual fine stuff, among which *Erica obtusa* and *E. maroccanica* were conspicuous. In Orchids Mr. Curror, Eskbank, and Mr. Grossart, shared honours in their order; the former having a fine *Cattleya Downiana*, and C. Gaskelliana, well flowered, in his lot of four. Space will not admit of following the schedule in detail, and we must turn to the nurserymen's classes.

Messrs. Laird & Sons had a grand table of choice foliage and flowering stove and greenhouse plants, with which they took 1st prize. Crotons and Dracenas, beautifully coloured Orchids, among which were some fine *Cattleya Gaskelliana*, *Bouvardias*, &c., indicate the character of the materials, and they were arranged in the best taste. Messrs. Ireland & Thomson stood 2nd with a well arranged table of fine stuff.

Table plants were a considerable feature of the show, Messrs. Laird & Sons taking 1st honours, and Messrs. Ireland & Thomson 2nd—among nurserymen; while Mr. Grossart was 1st in the gardeners' class.

Some splendid Roses were tabled by Messrs. Cocker & Sons, Aberdeen, who took 1st prizes in the principal classes; and Mr. Hugh Dickson,

Belmont, Belfast, played a worthy 2nd to them with beautiful flowers.

Vegetables were a capital show, samples being both numerous and superior in quality. The collections, which were very fine, were keenly contested, but Mr. Low, of Stirling, was placed 1st with a very fine lot. Potatoes were numerously exhibited, and notwithstanding the rumours of disease were perfectly clean and beautiful samples. The show on the first day was numerously attended, the weather being very favourable.

The dinner took place in the Waterloo Hotel in the afternoon, under the presidency of Bailie Macdonald. The toast of the Society was proposed by Councillor Colston, and replied to by Mr. Thomson, Clonfert, who touched on the general question of fruit culture.

### BATH FLORAL FETE.

On the four shows now held annually under the auspices of the Floral Fête Committee perhaps the autumn show is the most popular, and this year it must be regarded as of additional interest, owing to the city being honoured with the visit of the British Association. In connection with this latter event, there were a number of special classes for subjects mostly of botanical interest, and towards which the local committee voted a sum of £50. British Association Certificates of Merit have also been awarded to exhibits in these and other classes where these were considered specially meritorious. As in previous years, the show was held in Sydney Gardens, and was well attended. No fewer than eight tents were filled with exhibits; whilst most of the vegetable classes were, owing to want of space, placed outside.

*Fuchsias*.—These were a speciality of the show, and in few other districts do we meet with such huge specimens as we do here. For nine varieties, the plants in this class, as in some of the other classes, were 10 feet high, and full of bloom. The 1st prize was awarded Mr. Tucker, gr. to Major Clarke; the varieties shown were Bountiful, Harriet Lye, Hon. Mrs. Hay, Doel's Favourite, Miss Lucy Fenniss, Thomas King, Charming, and a rather promising seedling. Mr. Lye, gr. to Hon. Mrs. Hay, was 2nd.

For six varieties, Mr. J. Kiddeck, gr. to Mrs. Rinder, Bath, was 1st; Mr. Hawkins, gr. to Thos. Jolly, Esq., 2nd.

Three other classes of plants, one for four and two for single specimens, were also keenly contested.

*Plants*.—Some very good representative collections of these were to be met with, and in the class for twelve stove or greenhouse plants in bloom, Mr. J. Cypher, Cheltenham, was justly awarded 1st, with a clean and well flowered collection, consisting of Bougainvillea glabra, Erica obtusa purpurea, E. Thompsoni, E. Everiana, E. ampullacea, E. Barnesi, E. Irbiana, Phoenocoma prolifera Barnesi, Allamanda nobilis, A. Andersoni, Statice purpurea, Cleodendron Balfourianum, and Ikona Fraseri. 2d, Mr. Tucker, gr. to Major Clarke, Trowbridge. In the class for six ditto, Mr. Mould, gr. to E. E. Bryant, Esq., was placed 1st, with a clean fresh lot of medium sized plants; 2nd going to Mr. Wills, gr. to Mrs. Pearce, of Southampton.

In the class for twelve ornamental foliage plants, Mr. Cypher was again to the fore, his plants being Kentia Belmoreana, K. Fosteriana, K. australis, K. canterburyana, Cycas revoluta, C. undulata, Latania borbonica, Dasylirion acrotrichum, Crotons, several species—the whole of which were fine specimens, and the Crotons remarkable for high colour. The 2nd prize was awarded to E. E. Bryant, Esq., whose best plants were Eucalyptus horridus, Eucalyptus, Acalypha mosaica, Croton elegans, and Latania borbonica. In the class for eight ditto, Mr. Wills and Mr. Curry, gr. to Colonel Pepper, Salisbury, were 1st and 2nd respectively.

*Orchids* were numerously represented. In the class for six specimens, Mr. Cypher was 1st, with Oncidium incurvum, Cattleya guttata, C. Gaskelliana var. delicata, Odontoglossum grande, Mormodes luxatum eburneum, and Epidendrum prismatocarpum; the 2nd going to Mr. Wills, of Southampton. Other classes for Heaths and single specimen flowering and foliage plants were in most instances well contested.

*Ferns*.—We regret that space precludes our giving anything like a detailed report of many exhibits that might be considered worthy of special notice suffice it to say that such high authorities as Colonel Jones, of Clifton, E. J. Lowe, Esq., of Chesham, and J. M. Barne, Esq., of Clifton, were among the exhibitors of hardy Ferns, and that the trade was re-

presented by Messrs. Birkenhead, of Sale, Manchester, who had a collection similar to the fine one shown in London recently. Some of the most noteworthy plants in this collection were Gynogramma schizophylla var. gloriosa, Notholaena Muelleri (a very attractive and singular-looking species), N. sinuata, Adiantum Fergusoni, A. palmatum, and some other 300 species and varieties in about 600 plants. We must also note a large collection exhibited by the British Zoological Society not for competition, and chiefly with an educational object in view, which we do not doubt amply fulfilled its purpose. This collection, which was under the care of Mr. Harris, and were mostly collected and raised from seed originally by Colonel Jones, contained from 2000 to 3000 plants, and were arranged in the form of a long irregular border, faced with rockwork and boulders of stone, placed in the borders at intervals, and was greatly admired.

In the class for twelve Exotic Ferns Mr. Tucker was 1st, and Thomas Carr, Esq., of Tiverton, 2nd.

*Miscellaneous*. Groups of plants and cut flowers were exhibited by Messrs. R. Veitch & Son, of Exeter; R. Smith & Co., of Worcester; Sutton & Sons, of Reading; each and all of whom exhibited many novelties, and which were much admired.

Cut Flowers were fully represented by numerous well-known exhibitors.

For thirty-six Roses Mr. Budd, of Bath, was placed 1st, his best blooms being Mad. Lambard, Marie Van Houtte, Star of Waltham, Horace Vernet, Mdme. Charles Wood, and Fisher Holmes; 2d, Messrs. Perkins, of Coventry.

In the class for twenty-four blooms Messrs. Cooling & Sons were placed 1st, with good blooms of Duc de Rohan, Grace Darling, Captain Chritty, La France and others; 2nd, Dr. Budd.

Dahlias, twenty-four dissimilar.—Messrs. Keynes, Williams & Co., of Salisbury, 1st, with large, clean, well developed blooms, in so far as these are obtainable this unpromising season; 2nd, Messrs. Heath & Son, of Cheltenham.

For twelve varieties Mr. Hobbs, of Bristol, took 1st; and for nine fancy ditto Messrs. Keynes, Williams & Co. occupied a similar position.

Gladioli, thirty-six spikes.—Messrs. Kelway & Son were placed 1st for a very meritorious collection; 2nd, Samuel Dobree, Esq., of Wellington.

*Table Ornament*.—Mr. Cypher, 1st; Mr. Jones, 2nd. Messrs. Cooling exhibited some excellent Tea Roses, not for competition.

*Fruit*.—This was a great point of attraction to the majority of visitors, and was remarkable for the quality and quantity.

Collections of eight dishes had an imposing appearance, as may well be imagined, when it is stated that dishes of Peaches, Nectarines, Pears, and Figs, contained nine fruits in each. The 1st prize was gained by Mr. Pratt, gr. to the Marquis of Bath, Longleat, who had Black Alicante and Muscat of Alexandria Grapes, Barrington Peaches, Hero of Lockinge Malon, Moor Park Apricot, Morello Cherries, Blurple Nectarines, and Washington Plums; 2nd and 3rd were taking respectively by Mr. Nash, of Badminton, and Mr. Miller, of Rood Ashton.

Peaches, single dish.—1st, Mr. G. H. Richards, Somerset, Ringwood; W. Butter, Esq., 2nd.

Nectarines.—1st, Mr. Pym, 2nd, Mr. J. Curtis. Single dishes of Cherries, Plums, Figs, were equally well contested as the foregoing.

For three dishes of dessert Apples, Mr. Hall and Mr. W. Smith, of Bath, were awarded 1st and 2nd respectively; for culinary ditto, Mr. Miller and Mr. Hall occupied similar positions.

Grapes.—The class for twelve bunches in six varieties was one of the most important in the whole show, and although there were only two exhibitors the exhibits were characterised by very great merit. 1st, Mr. Taylor, gr. to J. Chaffin, Esq., of Bath, with Black Alicante, Alnwick Seedling, Muscat of Alexandria, Gros Maroc, Madreseld Court, and Black Hamburgh; 2nd, Mr. Pratt, his best bunches being Black Alicante, Muscat of Alexandria, and Foster's Seedling.

Six bunches in three varieties.—Mr. Taylor was again placed 1st, Mr. Pratt 2nd, and Mr. Gibson, gr. to Early Cowly, was 3rd.

Black Hamburghs, three bunches.—Mr. J. Chalk, gr. to G. Read, Esq., was placed 1st, the 2nd and 3rd going to A. Coles, Esq., and Mr. Gibson.

Muscat of Alexandria, two bunches.—Mr. Coates, Mr. Pratt, and Mr. Taylor, took the prizes in the order named.

Any other White.—1st, A. Cole, Esq., 2nd, Mr. Pratt. Any other Black.—1st, Mr. T. Jones, with Alicante; 2nd, Mr. Pratt, with Alnwick Seedling.

*Vegetables*.—For collection of twelve varieties Mr. Pragnell, gr. to J. D. Wingfield Digby, Esq., was 1st; his best exhibits were Autumn Giant Cauliflowers, Hackwood Park Tomatoes, Veitch's Matchless Carrots, Rousham Park Onions, Tender and True Cucumber, Parsnips, Artichokes and Snowball Turnips; 2nd, Mr. Copp; 3rd, Mr. Wilkins. Collection of six varieties, for prize offered by Messrs. Sutton & Sons: 1st, Mr. Pragnell; 2nd, Mr. Wilkins. For a similar collection, Messrs. Webb offered prizes in this instance, the awards going to Mr. Pragnell and Mr. Miller in the order named. Collections of Potatoes and single dishes of various other vegetables were shown in large numbers, and in some instances the competition was keen.

### BASINGSTOKE HORTICULTURAL.

THURSDAY, AUGUST 23.—The exhibition of this horticultural Society was held as usual in the "Goldings." The numerous plants, cut flowers, fruit, &c., made a most satisfactory exhibition, and the competition in most of the classes was severe, while the quality of much of what was shown was quite up to the average. The arrangements made by Mr. Weeks, the able Secretary of the Society, afforded much satisfaction to all concerned.

*Plants*.—The leading class was for twelve specimens, and these might be flowering or foliage, four growers competing. Mr. Bowerman, gr. to C. Hoare, Esq., Hackwood Park, Basingstoke, was 1st, his plants being healthy and well grown: Cycas revoluta and Allamanda Hendersoni were the finest. 2nd, Mr. F. Mould, Pewsey, Wilts, with smaller specimens, including nicely-flowered Heaths.

For six stove and greenhouse plants in flower, Mr. Mould was 1st.

Foliage plants were shown well by Mr. Bowerman, who was an easy 1st. Mr. T. Weaver, gr. to W. B. Beach, Esq., Oakley Hall, Basingstoke, staged in the single specimen class a very fine example of Eucharis amazonica with more than fifty spikes of bloom; and Mr. T. Russell was 2nd, with a well-grown specimen Fuchsia. Mr. Beaver gained 1st prize for exotic Ferns, his plants being large and well done. Hardy Ferns were best staged by Mr. Kneller, gr. to W. S. Portal, Esq., Malshanger Park, Basingstoke. Mr. Russell had the best Fuchsia, which was neatly trained and freely flowered. Table plants made a satisfactory feature, the best coming from Mr. T. Best, gr. to C. W. Chute, Esq.; Mr. Kneller following very closely. For a semicircular group not exceeding a 16 feet chord, Mr. Weaver won easily the 1st prize. The plants were of a varied character, and consisted of flowering and foliage plants put lightly together.

*Fruit*.—Mr. T. Best put up the only collection shown, which was one of six dishes. Pines being excluded. The Black Hamburgh Grapes, Peaches, and Nectarines were about his best fruit. In the class for Black Hamburgh Grapes there were six competitors, and Mr. T. Osman, gr. to L. J. Baker, Esq., Otter-shaw Park, Chertsey, was easily 1st with large, heavily shouldered bunches having large, well coloured berries; Mr. Kneller, in the any other black Grape class was awarded 1st prize, with two bunches of Gros Maroc, the bunches being of medium size with fine berries; Mr. Osman with Alicante taking the 2nd. The best Muscats of Alexandria were shown by Mr. Osman; and he also was 2nd for two bunches of any other white Grape—Mr. Kneller, with fairly good Buck and Sweetwater, being 1st.

Melons were not a conspicuous feature in the show; Longleat Perfection, from Mr. Kneller, being the best green-flesh variety, while Mr. Bowman's Blenheim Orange was considered the best scarlet flesh. This competitor also was 1st for a dish of Nectarines, finely coloured Elrue; handsome Noblesse Peaches, secured the 1st prize for Mr. Russell.

*Vegetables*.—These were shown in large quantities, of good quality, and the competition was keen. For twelve kinds, with not more than two varieties of Potatoes included, five competed. 1st, Mr. R. Lye, gr. to W. H. Kingsmill, Esq., Rousham Park, and Autumn Giant Cauliflower being his best dishes.

For six varieties, prizes given by Messrs. Webb & Sons.—1st, Mr. Kneller, with capital produce; as he likewise was for Messrs. Sutton & Sons' special prizes for six varieties.

For a collection of nine varieties of Potatoes, nine tubers of each.—1st, Mr. F. W. Seers, gr. to Captain Oldfield, his tubers being large, clean, and symmetrical, and comprised some of the leading varieties.

Messrs. Sutton & Sons' showed plants of their new netted strain of Gloxinias, and to whom a Certificate of Merit was awarded. The same firm exhibited a very fine collection of cut flowers of hardy perennials and annuals.

## SCOTLAND.

### DUNKELD FRUIT CONFERENCE.

THE invitation of Mr. Fairgrieve, announced in your issue of August 25, to leading gardeners and others interested in fruit culture to meet at Dunkeld Gardens for the purpose of inspecting the hardy fruit grown there, and conferring together on the subject, was numerously responded to on Friday, the 31st ult. Seventy-five gardeners, amateurs, and nurserymen from various parts of the country, met about 10 A.M. that morning under exceptionally fine weather, each obviously intent on making the most of the opportunity provided him to increase his knowledge of the subject that had brought them together. Among the company were Mr. Dunn, of Palace Gardens, Dalkeith, who was chairman of the Conference; Messrs. James Alexander and W. Welsh, of Messrs. Dicksons & Co., Edinburgh; D. P. Laird, of Messrs. Laird & Sons, Edinburgh; A. Milne, of Jas. Dickson & Sons, Edinburgh; R. B. Laird, of Messrs. Laird & Sinclair, Dundee; D. Croll, Dundee; Gossip, Inverness; McKenzie, Warriston Nursery, Edinburgh; Davidson, Pilrig Nursery, Edinburgh; R. Lindsay, Royal Botanic Garden, Edinburgh; W. E. Dixon, Edinburgh; W. Straton, Broughty Ferry; D. P. Scott, Monifeth; McKelvie, Broxmouth; Boyd, Callendar House; McHattie, Newbottle Abbey; Murray, Culzeau; McKinnon, Scone Palace; Henderson, Balbirnie; Temple, Carrow House, &c.

The beautiful natural features of this splendid Highland residence the visitors could only glance at and admire, and considerations of space, as well as the special object of the Conference, forbid dwelling on such points as were noted in the memory in the brief tour we made of the grounds after our inspection of the fruit was concluded. The general character of the place is most picturesque, highly deserving of more than passing notice, and at some future time I may be permitted to return to the subject more fully.

The Glasshouses, which lie on the way to the fruit and vegetable garden to the right from the entrance gate, consist of six vineries, several Melon, Cucumber, Fig and Peach-houses, and others devoted to stove and greenhouse plants and Orchids. The Vines are in fine health. The earlier crops were cut, but in the late houses Black Alicante, Lady Downe's, Muscat of Alexandria, &c., were a splendid crop and finishing well, but are considered by Mr. Fairgrieve to be later than usual, owing to the backward summer. Fine crops of Melons, Peaches, Nectarines and Figs were found in other houses, and Tomatos and Cucumbers were striking in their excellence and abundance. Passing on,

The Fruit and Vegetable Garden lies immediately beyond the houses, in a north-westerly direction, and the visitors were struck with their admirable situation. The garden is from 6 to 7 acres in extent, situate on the lower slope of the south side of the lofty Pine-clad hill of Craigiebarns, which is one of several similar hills that surround the beautiful grounds of Dunkeld on all sides. The surface angle is rather steep, rendering the working of the soil and other operations somewhat heavy. The soil is deep loam of medium texture, resting on sandstone, and the drainage is perfect. The walls are built in a semicircular or crescent form, extending from east to west, and the borders parallel to them are all unusually steep, owing to the necessity for depressing their outer edges to meet the level of the walks, which lie much below the level of the base of the walls. The variety of aspect, owing to the curvature of the walls, is considerable; but by far the larger portion is south and south by west, there being less of an easterly aspect than in most gardens in which the walls are built in the ordinary rectan-

gular form. The walls were inspected under the guidance of Mr. Fairgrieve, who commented on the merits of each sort of fruit tree from the point of view of its adaptability to the climate and other conditions of Dunkeld. As Peaches, Apricots, Plums, &c., were somewhat intermixed on the walls, it will be more convenient to describe them in generic order than as they turned up in their sequence on the route, and I will begin with—

*Peaches and Nectarines*, as they were perhaps the greatest surprise to the visitors. Not many districts in Scotland can boast a climate in which Peach and Nectarine trees may in ordinary seasons be depended upon to produce good crops of fruit in the open air. Dunkeld is one of the few districts that may claim such a favourable climate in so adverse a summer as we have experienced this year. The crops this season are not so uniformly good as they usually are, owing to the intense frost experienced in March, when many of the trees were in bloom. On the 17th of that month the thermometer descended to 4° above zero, consequently, the crops are generally less abundant than usual, and some trees were completely denuded of their flowers by the killing temperature of that date; yet there is a fair sprinkling of fine fruit on most of the Peaches and Nectarines. Royal George Peach is one of the best varieties for the locality, and one of it was the finest tree in the garden. This tree measured about 30 feet on a wall about 11 feet high, was in perfect health, and bore 170 fruit, of good size and splendid colour. Early Alfred Mr. Fairgrieve considers one of the hardiest and freest-bearing Peaches for the open air. The quality and size are not quite up to the highest standard, yet he considered it an indispensable sort to those in unfavourable districts, and being one of the earliest it augments the season of supply. Early York has similar qualities to recommend it, being early, prolific, and rarely missing crop. Hale's Early is an especial favourite with Mr. Fairgrieve. On a young tree of moderate size sixty very fine fruit showed themselves, taking on a remarkably fine colour. Rivers' Early York was bearing some fine fruit, but Mr. Fairgrieve finds it liable to the serious objection of cracking in the open air. Early Albert was considered an excellent sort, and a free bearer. Early Silver was bearing a light crop, and is a good sort in good seasons, much admired for the peculiar silvery colour of its flesh and fine quality, and for being among the earliest.

Of Nectarines, the best were Lord Napier and Pine-apple; a fine young tree of the latter had eighty fine fruit upon it. The former, although it bears freely, is generally too late to finish well in the district.

*Apricots*.—Of these, Large Early and Hemskirk were found best adapted to the district. The 1st named is undoubtedly the best, being always to be relied upon, and of fine quality and good size. One fruit, pulled at random from a tree bearing a heavy crop, was weighed on the ground and turned the scale at 3½ oz. Breda, though small, is accounted a reliable sort for the district.

*Plums*.—Crops of these were abundant. On the walls were splendid trees of Pond's Seedling, Kirk's Prince of Wales, Cox's Golden Drop, Jefferson, Green Gage, Cox's Emperor, Lawson's Golden Gage, Ickworth Imperatrice, Goliath, Victoria, Rivers' Early Prolific and St. Catherine; and these varieties are most relied upon in the district. Cox's Emperor and Cox's Golden Drop are found by Mr. Fairgrieve invaluable late sorts, being the latest to ripen, and keeping three weeks good without loss of flavour after they are ripe. Kirk's was considered by Mr. Fairgrieve the very best Plum in the list, taking quality and crop combined into account. Jefferson's he regarded as the best light-coloured sort, everything considered, for his district. Green Gages were fine quality and fair crops even this adverse season, but left nothing to be desired in good seasons. Transparent Gage, on the other hand, was valueless, and was to be done away with. The Imperial Gage bore the same character, and would share the same fate. As standard trees, Victoria and Caledonian Plums

were unsurpassably valuable, being sure and prolific bearers, and good in their way.

*Cherries*.—Of these there were excellent crops on trees of late kinds. Late Duke was superb, alike in crop and quality. Morellos were very abundant, Belle Agathe, valuable chiefly as being one of the latest sorts, hanging till the end of September, was represented by young trees seemingly about three years planted, but had their flowers destroyed in spring. As early and second early sorts, May Duke, Frogmore, Black Eagle, Bigarreau Napoleon, and Bowyer's Early Heart, were found admirable sorts for the district.

*Pears*.—Of these few are grown, and only one variety—Jargonelle—showing crop worthy of the term either in respect of quantity or quality. It was excellent in every respect.

*Apples* were more plentiful but not anything approaching the bulk of an ordinary crop on even such varieties as were fruiting at all. These were chiefly Lord Suffield and Keswick Codlin, which were bearing half crops or less, while Hawthornden, Irish Peach, Cellini, and others showed only a fruit here and there, and those by no means healthy and promising.

This brought the inspection of the hardy fruit to a close, and in so far as the Peaches, Nectarines, Apricots, and Plums, were concerned, the visitors may be said to have been most agreeably impressed with the success of Mr. Fairgrieve in cultivating so successfully these choicer fruits, in such an unlikely district as this Highland glen—which, however, appears to be a veritable Paradise. The party then rapidly visited the famous Larches, the earliest planted in Scotland (planted 1738); the fine old Abbey which stands near the mansion, and a well filled conservatory attached to the latter, and then adjourned to the Public Hall, Dunkeld, to lunch.

*The Conference*.—After luncheon, over which Mr. Dunn presided, with Messrs. Lindsay and McKelvie as croupiers, the company spent some two and a half hours' in conference. The Chairman, in a brief opening address, alluded to the growing importance of hardy fruit culture in this country. He believed it likely that farmers and others would in future give more attention to the subject than they had in the past, and while they might not all make fortunes in fruit culture, he was of opinion that it would be generally advantageous. It was important to confer with each other on the varieties of hardy fruit best adapted to different districts. They had seen to-day what could be done in the district they were now in—"a favoured but by no means rarely favoured spot." Accuracy in nomenclature was obviously an important point to study, and while the best methods of culture of the several kinds of hardy fruits ought to engage the attention of every one interested in the subject, the proper gathering, assorting, packing, unpacking, and even the proper way of eating the fruit should receive more attention. The Chairman then read some interesting details of the thermometrical experiences at Dunkeld of the recent spring and summer. March showed a variation of from 1° to 28° of frost; April gave twelve nights of frost varying from 3° to 14°. From May 1 to 5 the thermometer was slightly under freezing-point; during May, June, July, and August only two or three nights did the minimum rise to 45°; on May 11 and 12 it descended to 24° and 26° respectively. It reached 50° only in July, on the 11th, but again on the 31st of that month it descended to 29°. That morning (August 31) the thermometer indicated 32°, and the two previous mornings 33° and 38° respectively. These temperatures were not favourable to fruit growing, yet they had seen that, with good treatment and young healthy trees, fair crops of excellent fruit could be produced.

The Chairman then invited a discussion on the culture of the Apricot, Peach, Plum, and Cherry, which was entered into by Messrs. McHattie, Temple, McKelvie, Murray, Boyd, Milne, and Bisset, the result of which was to draw some general remarks from Mr. Fairgrieve respecting certain points of his practice. In regard to pruning he said he

favoured keeping the branches thin. By that means the wood became better ripened, and the trees were maintained in good health. He regularly protected his trees—Apricots, Peaches, Plums, &c.—at night, when in bloom and during the day also if an east wind blew. He never put a Peach, or any other tree, when planting it, in soil which had been occupied by the roots of the same kind before, and he used every means in his power to keep the roots near the surface, and was in favour of mulching.

Mr. McKenzie, referring to the advantages that accrued from such conferences, expressed the hope that the results of their meeting that day would not be evanescent. Hardy fruit culture had not made the progress during the past fifty years that certain other departments of horticulture had made, and he suggested that an association should be formed for the purpose of accelerating the progress and disseminating a sound knowledge of the art they had met to confer upon. He thought the matter might well be taken up by some central existing society.

Mr. R. B. Laird cordially approved of the suggestion made by Mr. McKenzie, and promised to do everything in his power to aid in its realisation.

A vote of thanks to Mr. Fairgrieve for his kindness and courtesy was proposed by Mr. Milne, and heartily accorded by the meeting, and a similar courtesy to the Chairman brought the meeting to a close.

## Obituary

MR. CHARLES MARKHAM, whose death, after a long illness, announced in the *Times* of September 1, was the Managing Director of the Staveley Company, which has very extensive coal and iron works near Chesterfield in Derbyshire. He was in early life Locomotive Superintendent of the Midland Railway, and took an active and prominent part in its development and administration. His strong good sense and energy of character enabled him through life to exercise great influence over the mining population. He occupied a prominent place among the younger men who took up the work of railway extension and development at the point at which it was left by the father of the system, George Stephenson, and he died at Tipton House, near Chesterfield, which was also Stephenson's last residence. Mr. Markham married Rosa, third daughter of Sir Joseph Paxton, and has left behind him a family of two sons and two daughters.

## THE WEATHER.

### THE PAST WEEK.

The following summary record of the weather for the week ending Sept. 3, is furnished from the Meteorological Office:—

The weather has been cloudy, unsettled, and changeable in all parts of the kingdom, and with a good deal of rain and some thunder and lightning. The temperature has been below the mean in all districts, the deficit ranging from 1° or 2° in Scotland to 4° in the east and south-west of England, and 5° in the 'Midland Counties.' The highest of the maxima, which were recorded on rather irregular dates, varied from 63° in 'England, N.W.,' and 65° in 'Ireland, N.' to 70° in 'England, E.,' and 71° in the 'Midland Counties.' The absolute minima, which were registered in most places either on Aug. 31 or Sept. 1, were as low as 36° in the east of Scotland, over eastern, central, and south-west England, and between 38° and 41° in most other districts. In 'England, N.E.,' however, the lowest reading was 44°, and in the 'Channel Islands' 50°. Frost was experienced on the grass over the inland parts of England during the early morning of the 1st, when the exposed thermometer fell to 31° in London and to 28° at Hillington.

The rainfall has been a little less than the mean in 'Scotland, E.,' 'Scotland, W.,' and 'Ireland, S.,' but more in all other districts, the excess over England being considerable.

Bright sunshine does not differ materially from that recorded last week, except in Ireland, where it

has been less prevalent. The percentage of the possible amount of duration varied from 19 in 'Scotland, N.' and 21 in 'Ireland, N.' to 36 in 'England, S.,' 38 in 'England, S.W.,' and 46 in the 'Channel Island.'

### MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING SEPT. 15. (AVERAGE OF FORTY-FOUR YEARS.)

Sept. 9 ... ..	58°·9	Sept. 13 ... ..	58°·1

## NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, do PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

CORRECTION.—In the report of the Sevenoaks show, in our issue for September 1, the *Dipladenia amabilis*, shown by Mr. Gibson, gr., Halstead Place, possessed 147 blooms, not forty-seven, as there stated.

DRYING FLOWERS, &c., FOR THE HERBARIUM: Several Correspondents. See *Gardeners' Chronicle* for January 21 last, p. 82.

DOUBLE WHITE LATAGERIA: J. C. Many thanks; a more double flower was noticed last week.

EUCHARIS BULBS: K. & B. We failed to find any trace of the bulb-mite.

FOUR-LEAVED CLOVER: C. G. This is of common occurrence in rich land. As to the saying, of good luck attending the finder, we suppose it is on a par with a great deal of folklore on similar subjects.

GRAPES IN BAD CONDITION: J. C. If "J. C." who wrote to us about his Grapes recently, will send his address to J. Burt, 169, Boundary Road, Walthamstow, he may hear from him something which may prove of service in Vine growing.

INSECTS: W. W. It is difficult, without more precise information, to decide on the cause of the injuries to the different kinds of leaves and shoots sent. We, however, found several young mealy-bugs (*Coccus adonidum*) amongst them, and also a young apterous *Pocuss*. The plants did not appear to have been well cared for from the specimens sent. I. O. W.

LILIU AURATUM: A. F. L. Both red and golden banded flowers are common, and the trade sometimes tell them under distinctive names.

NAMES OF PLANTS: E. C. C. D. *Calamintha clinopodium*, common on limestone soils.—T. J. Walton. Next week.—G. C. *Lilium pomponium* probably.—B. A. 1, *Stanhopea Wardiana aurea*; 2, *S. Devoniana*.—J. Cameron. *Hyoscyamus niger*.—R. L. *Clethra alnifolia*.—R. N. 1, *Polygonum Sieboldii*; 2, *Bocconia cordata*; 3, insufficient: possibly a *Rudbeckia*; 4, *Aconitum napellus*.—C. M. O. *Orlaya grandiflora*; *Inula britannica* var.; the *Cheiranthus* we cannot name. Where is it from?—A Correspondent. 1, *Sisyrinchium anceps*; 2, *Achillea Clavennae*.

ROSEMARY AND *TROPEOLUM SPECIOSUM*: J. P. The former may be grown from seeds sown on a warm border in April or May, or from cuttings (slips) about 6 inches long put in now in sandy soil under a handglass. To obtain strong plants, without much delay layering is to be recommended. It should be done at once, and the rooted plant, with its ball of earth and roots, removed early next autumn. The latter is increased by seeds, and by the division of its underground rhizomes.

SEEDLING CARNATION: H. T. The flower sent is darker than the common *Clove Carnation*, but it has the same grateful perfume, and the flowers, being only of half the size of that variety, it is better suited for some kinds of florist's work.

SOME HARDY PERENNIALS FLOWERING IN AUGUST AND SEPTEMBER: W. R. *Tritoma uvaria*, T. glaucescens, T. graminea, *Phlox decussata* in great variety, *Gaillardia*, early flowering *Chrysanthemums*, *Aster amellus*, A. *Bessarabicus*, and others; *Eryngium album*, *Monarda didyma*, purple and scarlet vars.; *Oenothera pumila*, (E. Youngi), C. Fraseri, *Stenactis speciosa*, *Solidago arguta*, S. *memoralis*, *Pentstemon gentianoides*, in great variety; *Campanula persicifolia*, *Rudbeckia hirta*, R. *fulgida*, *Helianthus altissimus*, H. *grandiflorus*, *plenus*, *Lathyrus latifolius*, in variety; *Achillea ptarmica alba flore pleno*, *Spiraea palmata*, *Bocconia cordata*, *Chelone barbata*, *Anemone japonica*, A. j. *Honorine Jobert*, *Violas*, *Tropeolum polyphyllum*, T. *speciosum*, *Gladiolus*

gandavensis, G. hybridus Lemoinei, Lilium auratum, L. lancifolium, L. l. punctatum, L. l. rubrum, and Agapanthus umbellatus.

**TOMATO ROT:** A. S. Yes, they are affected by a fungus identical with, or very nearly allied to, the Potato-fungus. We fear you can do nothing in the way of cure, but you can prevent its spreading by destroying all affected plants.

### CATALOGUES RECEIVED.

**B. GILBERT, Dyke, Bourne, Lincs.**—Bulbs and Anemones.

### SEEDS.

**LONDON: Sept. 5.**—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that a fair business has lately been doing in Clover and other seeds, with a strong upward tendency in values. On account of the continued unfavourable weather the prospects for the new crops are extremely bad, and in consequence all descriptions are held for higher prices. This applies especially to red, white, and Alsike Clover seed, and particularly to Trefoil. Winter Tares are advancing. There is no change in seed Rye. Trifolium keeps steady. New blue Peas are now appearing. Feeding Linseed is firm.

### GORN.

**Averages.**—Official statement showing the average price of British corn, imperial measure, in the week ended September 1:—Wheat, 36s. 4d.; Barley, 26s. 10d.; Oats, 19s. 9d. For the corresponding week in 1887:—Wheat, 38s. 11d.; Barley, 27s. 5d.; Oats, 15s. 6d.

### FRUIT AND VEGETABLES.

**COMPTON: September 5.**—Good supplies of all kinds of fruits, fresh vegetables, Potatoes, &c.; demand slow, at prices as follows:—Fruit: Damsons, 3s. to 3s. 6d. per half sieve; Plums, English, 3s. to 3s. 6d. do.; foreign do., 2s. to 2s. 6d. per basket; English Green Grapes, 6s. 6d. to 7s. per bushel; foreign do., 2s. 9d. to 3s. 6d. per half-bushel; Pears, 4s. to 5s. per bushel; Apples, 3s. 6d. to 6s. do., do., 2s. to 3s. per half-bushel; English Tomatoes, 5s. 6d. to 6s. 6d. per peck; foreign do., 1s. 9d. to 2s. 3d. per box of about 18 lb. Vegetables: Cabbages, 1s. 6d. to 2s. 6d. per tally; Vegetable Marrows, 1s. 6d. to 3s. do.; Cauliflowers, 2s. 6d. to 6s. do.; Peas, 1s. 6d. to 1s. 9d. per bushel; do., 2s. to 2s. 3d. per sack; Broad Beans, 1s. to 1s. 3d. per bushel; do., 2s. to 2s. 3d. per sack; Scarlet Runners, 1s. to 1s. 6d. per sieve; do., 2s. to 3s. per sack; French Beans, 1s. 9d. to 2s. per sieve; Onions, 1s. 9d. to 2s. 3d. per dozen bunches; Turnips, 1s. 6d. to 2s. do.; Carrots, 1s. 6d. to 2s. do.; Beetroot, 2s. 6d. to 3s. do.; Mint, 1s. 6d. to 2s. do.; Parsley, 1s. to 1s. 6d. do.; foreign Onions, 2s. 3d. to 2s. 6d. per bag of about 110 lb.; frame Cucumbers, 1s. 9d. to 3s. per dozen; common do., 9d. to 1s. do.; Endive, 1s. 6d. do.; Cos Lettuce, 6d. to 8d. per score.

### POTATOES.

**BOROUGH AND SPITALFIELDS: Sept. 4.**—The market is fully supplied, assortment variable, demand slow, and prices irregular:—Regents, 55s. to 58s.; Shaws, 50s. to 70s.; Hebrons, 60s. to 85s.; kidneys, 60s. to 85s.; Early Roses, 40s. to 60s. per ton.

**SPITALFIELDS: Sept. 5.**—Quotations:—Magnums, 50s. to 60s.; Imperators, 55s. to 60s.; Early Rose, 50s. to 55s.; Englishkidneys, 60s. to 65s.; do. Regents, 60s. to 70s.; and Beauty of Hebron, 50s. to 60s. per ton.

### SPHINCTER GRIP GARDEN HOSE.

The Sphincter Grip Spring Steel Galvanised Armoured Hose is the most valuable improvement in Hose since 1840. Its lasting qualities are ten times greater than any Hose not armoured. Its complete success has caused some parties to infringe the Patents owned and controlled solely by us; and we therefore notify all such that the making, vending, or use of any armoured wire-wound Hose not of our manufacture is an infringement of one or more of our several Patents, any violation of which will be promptly prosecuted. Brass plates set between the Hose and wire denote our Manufacture and the Patents.

**HOLLOWAY'S PILLS.**—Wrong made Right.—Every day that any bodily suffering is permitted to continue renders it more certain to become chronic or dangerous. Holloway's purifying, cooling, and strengthening Pills are well adapted for every irregularity of the human body, and should be taken when the stomach is disordered, the liver deranged, the kidneys inactive, the bowels torpid, or the brain muddled. With this medicine every system of the body, and those who are weak and infirm through imperfect digestion may make themselves strong and stout by Holloway's excellent Pills. A few doses of them usually mitigate the most painful and dangerous symptoms caused by indigestion, and thoroughly free the alimentary canal and completely restore its natural power and action.

## TESTIMONIAL.

From MR. JAS. DOUGLAS, Head Gardener to  
 Francis Whitbourn, Esq., Great Gearies,  
 Ilford, Essex.

"SIRS,

"I beg to say that the large range of  
 Hothouses you erected and heated here have given  
 the greatest satisfaction. There is not one  
 thing, from the largest down to the most minute  
 details, that it is possible to find fault with.  
 Although the Houses are exposed to fierce gales,  
 not a pane of glass has been broken by winds  
 since they were erected. All our visitors remark  
 on their light and elegant appearance.

"I am, very truly, yours,

"JAS. DOUGLAS."

## ORCHID HOUSES A SPECIALTY.

## IMPROVED PORTABLE SPAN FRAMES.

The BEST and CHEAPEST Frames yet introduced.

The Lights can be set open either for ventilation or watering without the necessity  
 of the usual inconvenient and dangerous wood prop. They can be at once removed if it  
 is wished to expose the contents of the Frame.

Boronia megastigma

Quantity of extra strong *Maréchal Niel* and *Tes Rosas*

4,000 Grevillea robusta

5,000 Small E. hyemalis and 5,000 Small E. gracilis, for growing on

8,000 Solanum capsicastrum, in berry

2,000 Bouvardias, single and double

2,000 Genistas, very fine

Cyclamen persicum

3,000 *Adiantum cuneatum*

3,000 *Lomaria gibba*, true, compact variety, and other Ferns

May be viewed. Catalogues may be had on the Premises, or of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C., and Leytonstone, E.

N.B.—Messrs. P. & M. desire to call the attention of intending purchasers to the Stock to be offered as above. The Plants are remarkably well grown, fit for immediate Sale, and the whole will be found in an equally good condition as former years.

## Lea Bridge Road, E.

ANNUAL UNRESERVED SALE of fine Winter-flowering HEATHS, &c.

**MESSRS. PROTHEROE AND MORRIS** are instructed by Mr. John Fraser to SELL BY AUCTION, on the Premises, the Lea Bridge Nurseries, Lea Bridge Road, Leyton, E. (close to the Hoe Street Station, Great Eastern Railway) on WEDNESDAY, September 19, at 11 o'clock precisely, in consequence of the large number of Plants. A large quantity of WINTER FLOWERING and OTHER PLANTS, including:—

12,000 Erica hyemalis

3,000 Erica gracilis

2,000 Ampelopsis Veitchii

4,000 fine named Hollyhocks

1,000 *Lagerflora* roses superba

6,000 *Cyclamen persicum* (Fraser's superb strain)

And a great number of *Aranaria* excolis, *Epacris*, *Pasiflora*, flowers, *Jasmines*, *Honeyuckles*, variegated *Iries*, *Lagerflora*, alba from seed, and other plants.

The whole of the Stock is in the best condition, and ready for immediate Sale.

May be viewed. Catalogues had on the Premises; and of the Auctioneers, 67 and 68, Cheapside, London, E.C., and Leytonstone, E.

## Enfield Highway, N.

The Brimsdown Nursery, adjoining Brimsdown Station, Great Eastern Railway.

TWENTIETH ANNUAL TRADE SALE.

**MESSRS. PROTHEROE AND MORRIS** are instructed by Mr. SELLER to SELL BY AUCTION, on the Premises, the Brimsdown Nursery, Enfield Highway, N., on THURSDAY, September 20, at 11 o'clock precisely, in consequence of the unusually large number of lots, without reserve, upwards of 100,000 of the best well-grown STOVE and GREENHOUSE PLANTS, mostly in 48-pots, and fit for immediate Sale, consisting of:—

15,000 winter-blooming

Heaths, including *Erica*

hyemalis, *gracilis*, *Caffra*, *Wilmorea*, &c., and extra large

*E. Cavendish*

5,000 Solanums, exceptionally well grown

5,000 Ferns, *Adiantum*, *Pteris*, &c.

3,000 Tree Carnations, leading varieties

5,000 Epacris, sorts

5,000 Bouvardias

3,000 Genistas

1,000 Geraniums, improved

Queen of White, &c.

Many thousands of small *Ericas*, *Genistas*, *Ferns*, &c.; large quantities of *Acacias*, *Gardenias*, *Euphorbia jacquinioides*, *Chrysanthemums*, *Poinsettias*, *Enonymus ovatus aureus*, in which the first-class and other extra large

May be seen any day prior to the Sale. Catalogues may be had on the Premises, or at the Brimsdown Nursery, Tottenham; and of the Auctioneers, 67 and 68, Cheapside, London, E.C., and Leytonstone, E.

N.B.—The Auctioneers desire to call the attention of intending purchasers to this GREAT ANNUAL TRADE SALE, which has hitherto been the first and best conducted by Messrs. Protheroe & Morris, Tottenham; but, in consequence of the Lessee of that Nursery having nearly expired, the Sale this year, and in future, will take place as above, adjoining the Brimsdown Station, G.E.R. The whole of the first-class condition, and the *Ericas* being especially well set for flower, and the Solanums unusually well berried. There will also be this season a Sale at the BRIMS DOWN NURSERY, Tottenham, on THURSDAY, September 27, of which a separate Advertisement will appear.

# A NEW, BEAUTIFUL VIRGINIAN CREEPER.

## AMPELOPSIS "DAWN OF DAY."

This is a Seedling from the old Virginian Creeper (*Ampelopsis hederacea*), and is certainly by far the most striking and beautiful of the *Ampelopsis* family. Description fails to give an adequate idea of the telling loveliness of this grand creeper. Imagine an *Ampelopsis* with magnificent mottled foliage—charming in tints with the season, like a fairy transformation scene—until, adorned in its autumn garb, it farther enhances its beauty by the addition of beautiful berries—comprising in their different degrees of ripeness, most delicate and attractive shades, varying from verdant green to rich deep purple. A plant of this once seen will never be forgotten.

PRICE:—  
2s. 6d., 3s. 6d. & 5s. 6d. each; 24s., 36s. & 48s. per doz.  
N.B.—Three or more at rate per dozen.

# A CLIMBING HYDRANGEA.

## HYDRANGEA SCANDENS.

Thus described by the Amer can introducer:—  
"This beautiful climbing plant is destined to take a front rank in popular favour. It is perfectly hardy and grows rapidly when well established. It exceeds best if planted at the base of a large tree, up which it climbs, clinging to the bark like English Ivy. The engraving was taken from a specimen in the grounds of L. H. Meyers, Esq."  
"The plant in question was a gorgeous sight, and attracted widespread interest and admiration when in full bloom."  
"The flowers are pure white."

A tree that has this lovely pure white climber entwined in its branches presents the appearance of so many beautiful white stars shining through the foliage. And the flowers being so very beautiful and pure white renders it a most valuable acquisition to our hardy white flowerung plants.

Marked Gardeners, Bonquet-Makers, &c., will find the blooms of this plant give to cut flowers a chaste, uncommon, elegant appearance, much lacking in our present strictly hardy, pure white flowers.

2s. 6d., 3s. 6d. & 5s. 6d. each; 24s., 36s. & 48s. per doz.  
N.B.—Three or more at rate per dozen.

# NOTICE

## TO THE HORTICULTURAL TRADE.

HAVING for some years past, owing to the particular nature of my business as a Horticultural Agent, recognised to the fullest extent the absolute importance of securing speedy transit and quick delivery, in the case of all plants sent from the Continent to England and vice versa; and having myself suffered great inconvenience, annoyance, and loss from causes which could easily have been avoided, had the shippers entrusted with plants possessed any practical knowledge of their nature and requirements, I beg to inform you that, my business with the Continent having become so extensive, I am now obliged, in self defence, to take up the business of a

## SHIPPING AND FORWARDING AGENT.

I am so well aware of the serious consequences of a few hours frost in the case of plants left on the wharf for a night—as frequently happens—and which by a little care in warehousing can be easily avoided, to the great benefit of sender and buyer, that I have determined in future to give all such details my closest personal attention, and beg you to recognise the advantages which will thus be gained by your shipping all your consignments to this country through me.

I have secured admirable premises for this branch of my business at 12, Cooper's Row, Crutched Friars, London, E.C., and with the available accommodation at the various wharves for the proper and prompt warehousing of the most tender plants, am in a position to assure you that I possess every facility for conducting the business in a manner that I am sure will give satisfaction to those who may favour me with their patronage and support.

## Gardeners' Chronicle.

**SATURDAY, SEPTEMBER 15, 1888.**

## CONFERENCE OF FRUIT GROWERS.

A COMMITTEE, consisting of about sixty of the principal fruit growers in the United Kingdom, having made arrangements for a Conference on Fruit Growing, a large and representative meeting was held on Friday the 7th inst. in the saloon at the Crystal Palace, Sydenham, and was followed by a second Conference on Saturday. On each day there was a crowded attendance, and the papers read evoked a highly interesting discussion on matters cognate to fruit cultivation. Friday's Conference began at 3 o'clock, under the presidency of Mr. T. Francis Rivers, Chairman of the Executive Committee, the Chairman inaugurating the business of the meeting by reading the following address:—

## FRUIT CULTURE FOR PROFIT.

By T. FRANCIS RIVERS, Esq., SAWBRIDGECROFT.

OUR meeting to-day is, I hope, the first of a series of meetings on the very important subject of fruit culture in England for profit. Within the last few years a very great advance has been made in this direction by the force of circumstances, and not by the speeches of any one man, however eminent. When Wheat was worth from 40s. to 60s. per quarter there was no need to apply the resources of the land to any other purpose, as the price of Wheat governed the price of produce, and was amply sufficient to support the different interests depending on the land. We have now, however, to face an altered condition of affairs. The land is with us, and is as productive as ever, but the consumer no longer pays the price required by the English producer; and although it is absurd to suppose that corn is not still the ruling crop, yet all cultivators are forced by circumstances to consider whether they cannot be assisted by other crops. One of these helps or aids is undoubtedly the cultivation of fruit, which is of daily consumption, and is, or ought to be, on the table of every individual in the United Kingdom. We have, therefore, to deal with a very large subject—nothing less than a national industry, and an increasing one, the development of which enters into conflict with no British interest, trends on no man's toes, is strictly non-political, will suffer no decay but improve as the years roll on, and in which succeeding generations are quite as much interested as we are, and is a pursuit from first to last

which never wearies. A man between seventy and eighty can make the superintendence of orchards both his pleasure and employment.

We have not, I think, in England held enough meetings of this kind; they are frequent enough in the United States, where fruit is an important factor in national life, and takes rank with the most advanced agriculture. In Belgium, a country which profits largely from the exportation of fruit, pomological congresses are constantly held. I have attended several, my first introduction to Belgian pomologists being at Namur in 1862, when the hospitality of the town was profuse and splendid. There can be little doubt that these meetings are of great public utility, and now that we are entering the lists and preparing to meet an enormous and increasing domestic want, it does not become a great and wealthy country like England to be anywhere but first in the race. Our climate is good, our soil so varied that we can find land for all ordinary crops. Although we are subject to cold and late springs, yet we do not suffer from the extremes of heat and cold to which great continents are subject, storms which destroy the fruit, and cold which will destroy the trees. Neither is it so equitable that fruit trees are exhausted by continual bearing—a condition under which eight to ten years would be the term of the natural life of the tree—conditions which would, no doubt, be satisfactory to the fruit tree grower, but with the inevitable result of the supply overtaking the demand, and of the usual disastrous consequence. Of this, however, we need have no fear. We must, in order to secure early profits from a garden orchard such as I propose, plant on a different principle to that of our forefathers, who have bequeathed the hoary and lichen-covered trees dear to the artist and fruit-loving boys and girls. These picturesque old trees are as much things of the past as our wooden three-fleckers, and instead of the acre of grassland with the customary 108 trees often broken down by stock, and producing more wood than fruit, the modern fruit orchard must be condensed into a compact compass, give more fruit in 1 rood of land than in 2 or 3 acres of the old-fashioned style.

*Soil.*—The most important part of the preparation of an orchard is, of course, the quality of the soil, and the intending planter should not hesitate to spend a few shillings in obtaining an analysis. I attribute a great part of my success in fruit growing to the nature and qualities of the soil. An analysis made by Dr. Voelcker for Mr. Prout, of Sawbridge-worth, gives the following constituents of the land on his farm, mine being the same formation, and closely identical. The quantities are contained in a depth of 6 inches per acre:—

Phosphoric acid	... 24 tons	Sulphuric acid	... 24 tons
Potash	... 5½ "	Nitric acid	... 22 lb.
Lime	... 37 "	Nitrogen	... 1 ton
Magnesia	... 4½ "		

I shall show presently by an analysis of fruit that the inherent qualities of this soil are vastly favourable for certain classes of fruits, and if the depth instead of 6 inches is extended to 20 inches, to which the roots of fruit trees will reach in searching for food, the aliment afforded is of inexhaustible amount. With our present knowledge of artificial manures all deficiencies in other soils may, however, be easily supplied; but I hope that you will agree with me that an analysis of the soil is indispensable, and that it is necessary not to judge only by appearance, but to gain an intimate knowledge of the soil constituents. A deep rich loam is sometimes misleading, and trees, though apparently vigorous at first, being deprived of their requisite food will become cankered and stag-headed. The cultivator must make it his business to cure this defect, which an elementary knowledge of chemistry and of the application of chemical manures will enable him to do. The position of the orchard is another important point. It is, I think, well known that frosts are more severe in low-lying lands near rivers, and fruit trees should consequently be planted above the line indicated by the rising mists,

The preparation of the soil is the next point, and I will assume that a man with 100 acres of land can afford to devote 1 rood for the cultivation of an orchard; this must be fenced with wire netting high enough to keep out hares and rabbits during snow, as one night's visitation of these animals would suffice to destroy the growth of years and to ruin the plantation. In my own case I have sunk a barbed wire to prevent burrowing. Wire netting is so cheap that this expense is not great, and with proper care it will last for years. At all events, it must be incurred, for although rabbits may be utterly destroyed, hares will travel for miles in search of food. In Belgium, in the fruit-growing districts, they are altogether absent, but it is not likely that this will ever be the case in England. The land, if at all infested with Twitch, should have a summer's fallow to eradicate the pest, as it cannot be easily destroyed when the trees are planted. It will grow amongst the roots, and is then most difficult to deal with. As early in September or October as practicable the rood of land, having been previously dressed with some 12 or 15 tons of good farmyard manure, should be trenched to the depth of 24 inches, the top soil being kept at the top, and the bottom broken up and turned over. I am convinced that this costs about 1s. 6d. per square rood, or £3 for the rood, according to the tenacity of the soil, and is absolutely necessary, as I have found from experience that my plantations made in a soil which has been frequently trenched bear more abundantly, and give finer fruit, and are more healthy than those which I have planted in holes only without moving the surrounding soil. The rood of land trenched and fenced will be ready for the reception of the trees in November, the soil being pulverised and settled. Considerable expense having been incurred, I propose to show that the planter will be able to recoup himself by the number of trees he can plant and the consequent produce. The rood of land will accommodate about 400 trees—that is, 200 trees planted 9 feet apart row from row and 6 feet apart in the rows of Plums, Apples, and Pears, and 200 bushes of Currants and Gooseberries between at 6 feet apart in the rows. The rood, therefore, will contain as many Apples and Plums as 2 acres of the ordinary farm orchard, and enough bush fruits to pay all rent and expenses, and will be protected from all injury from stock and game, and without such protection it is useless to plant.

*Plums.*—In my own district the Plum is the most valuable fruit I have, and it is not difficult to explain the reason of this superiority. The Plum, according to an analysis drawn out by Mr. Edmund Tonks, of Birmingham, contains:—

59·21 potash	15·10 phosphorus
10·00 lime	3·33 sulphur
5·46 magnesia	2·36 silicon
3·30 iron	

All of which constituents are largely present in my soil. It is one of the most valuable fruits of our domestic economy, it makes a delicious and nutritious preserve, and during the months of July, August, September, October, and even in November, it may be present daily on the dinner table either cooked or uncooked, and I believe that certain classes of the Germans almost exist on the fruit, such are its nourishing qualities. The sort which I plant the most extensively is the Early Rivers or Early Prolific; this was raised by my father some fifty years since, and in the most disastrous seasons I have never known it completely fail. I believe this immunity to be owing to the fact that from its precocity (as I have known the whole crop gathered by the 5th August) the tree has time to recover its strength in the period of nearly eight months which elapses between the gathering and the next season's blooming. The density of the fruit is very great, as it weighs 70 lbs. to the bushel. This is against the producer, and it ought to be sold by weight. I believe that as a dried fruit it will fully equal the dried French Plums. Close to the gathering of the Early Prolific I have the Czar, a large purple blue Plum of abundant fertility; then the Sultan, and at the end of September Prince Engel-

bert and Pond's Seedling; and beginning of October the Monarch, Archduke, and Grand Duke. I have discarded the Diamond, Reine Claude de Bayre, Reine Claude d'Oullins, Belaine Purple, as too uncertain for market Plums. For the farm orchard the interval between the Sultan and Pond's Seedling should be filled up by the Victoria, Green Gage, Gisborne's, and the Pershore, all of which are well-known market Plums, and are equally suitable for cooking, preserving, and drying, and I hope one day to see the grocers' shops continually supplied with these Plums of British manufacture. The Cluster Damson, well known for its enormous fertility; the Prune and Shropshire Damsons are also very important fruits which should find a place. The sort of tree to be planted should be what are usually called two or three years unpruned standards, the younger the better, as the transplanting causes little injury to young trees. I may here mention that the Early Rivers does not prosper in my soil when grafted on the Mussel stock. The future health of a plantation depends very much on the stocks used, and it is therefore necessary to be particular on this head.

*Apples.*—The fruit which stands most in national importance is of course the Apple, and it seems strange that we should allow foreign nations to usurp our position in the supply of this very necessary want. In the 200 trees required for the rood I should apportion 100 Apple trees, and for a continual supply of culinary fruit Keswick Codlin, Duchess of Oldenburg, Lord Suffield, Stirling Castle, Worcester Pearmain, Manks Codlin, Ecklinville Seedling, Lord Grosvenor, Warner's King, Blenheim Orange, Baxter's Pearmain, Lady Henniker, Tower of Glamis, Betty Geeson, Dumelow's Seedling, will last from August to the end of April; of dessert Apples, Red Juneating, Irish Peach, Summer Golden Pippin, Devonshire Quarrenden, Williams' Favourite, Ribston Pippin, Cox's Orange Pippin, King of the Pippins, Blenheim Orange, Mannington's Pearmain, Lord Burghley, Sturmer Pippin, Allen's Everlasting, will give a supply from June to May. On the Paradise stock all these Apples will form fruitful and profitable bushes and are all marketable Apples, and in my opinion are very much better than any Baldwins or Newtown Pippins. Some of these kinds, such as the Manx Codlin and Stirling Castle, can be planted 6 feet apart. Worked on the Crab stock, they are so fertile that they are soon dwarfed by the production of fruit. As with Plums, I should recommend trees two or three years old being planted. Of Apples of recent introduction I have not found Mr. Gladstone so good as it was represented. It is not earlier than the Juneating, is very unequal in size, and has the unpleasant habit of being in a constant perspiration. Lady Henniker is a large and fine Apple. Pease-good's Nonsuch is very handsome and large, but does not bear so freely in my soil as the Apples I have named. The stock English Apple, the Blenheim Pippin, is a long time coming into bearing, but when fruitful always commands a high price; this and the Dumelow's Seedling would, no doubt, be valuable for cutting into chips and rings.

The analysis of the Apple differs from the Plum. There are present:—

Potash	... 35·68	Iron	... 1·40
Soda	... 26·09	Phosphorus	... 13·69
Lime	... 4·08	Sulphur	... 4·02
Magnesia	... 8·75	Silicon	... 4·82

*Pears.*—The Pear is the next in rank as an industrial fruit, but it by no means equals the Apple or the Plum in importance; indeed, during a great part of the year it is seen only on the tables of the wealthy. I have, however, had a considerable experience of Pears as standard trees. Within my recollection I have seen planted and destroyed the following sorts:—Summer Bergamot, Lammas, Passans du Portugal, Windsor, Williams' Bon Christien, Dunmore, B. d'Anaplis, Marie Louise, Louise Bonne of Jersey, Winter Crassane, Beurré d'Capimont, Beurré Bosc, Comte de Lamy, Hessele, and Spring Beurré, none of which ever paid the rent of the ground they occupied. I have, however, raised three sorts of Pears which will reverse this position. These are the Beacon, ripen-

ing the end of August, and beginning of September, which is so fertile that grafted on the Pear stock it may be planted at the same distance as the Plum and the Apple; the Fertility, which is equally fertile either on the Pear or Quince; and the Conference, which is not yet introduced to the public. The two former are already well known. Of recent foreign Pears which are hardy, Madame Treve, Souvenir du Congrès, Marie Louise d'Uccle, and Emile d'Heyat are marketable sorts; of baking Pears the Catillac is probably the best. The Pear differs in analysis from the Plum and Apple. It contains:—

Potash	...	54.69	Iron	...	1.94
Soda	...	8.52	Phosphorus	...	18.20
Lime	...	7.98	Sulphur	...	5.69
Magnesia	...	5.22	Silicon	...	1.49

The best class of tree for planting is the two and three years old on the Quince stock, excepting the Souvenir du Congrès and the Beacon, which should either be double grafted or on the Pear stock.

The Morello Cherry on the Mahaleb stock makes a very prolific bush. Grown in this way or trained to iron wires it may be easily protected with netting. Between the rows of pyramid or half-standard trees Currants and Gooseberries can be planted without in any degree injuring their produce, care being taken to return to the soil by chemical manure the constituents of which it is deprived by the growth and fruitfulness of the trees. By attention and occasional analysis there will be no more difficulty in doing this than in providing for the ordinary farm crops.

**Pruning.**—In a farm orchard it is not necessary to prune trees severely. Pears and Apples in unfruitful seasons should have the shoots stopped in June, and should be occasionally examined and the inner growth lightened to let in the sun and air. About the end of September the shoot made after the first pruning should be shortened to four or five buds. As soon as the trees are fruitful very little pruning is required. Plum trees require as little pruning as possible, but all gross shoots should be removed when observed. The sorts of Plums I have named grow so early that they do not grow into very large trees. In these garden orchards it is not well to allow the trees to grow to more than 10 to 12 feet. Avoid the use of long ladders as much as possible, and the consequent expense and delay in picking, which ought to be done by women and boys.

**Drying.**—It is lamentable to hear of the shameful waste undergone when we have what is called a glut of fruit, and we shall hear no doubt in another paper of the proper means to be taken to prevent this loss. I have heard of tons of Plums in Worcestershire rotting because of the excess. There is no doubt that all this material could be saved and turned into food. The Persian shepherd goes out to his work provided with a bag of dried Peaches, which are so hard that he chastises his dogs with them. The dried Misch Apricot is a staple caravan food, made into cakes and carried in a small compass. We pay a large sum to the French for dried Plums, and the ladies in Portuguese convents are properly employed in preserving the delicious Guimaraens Plums. The absence of sun is no excuse for our being so backward in these matters. We can and do ripen Grapes as well as the hot sun of Spain, and artificial heat will serve us as well for drying fruit as for ripening Grapes.

The disastrous malady termed canker may be much alleviated by attention to the soil constituents, and in a paper read at Birmingham Mr. Tonks stated that he had removed the disease by the application of chemical manures, potash being the principal ingredient.

The trees in my soil are almost entirely free from the disease, and this immunity is probably owing to the abundance of potash, which should be returned to the soil at every opportunity. The dressing applied by Mr. Tonks consists of nearly equal quantities of superphosphate of lime, nitrate of potash, nitrate of soda, sulphate of lime. Although pruning may be carried to excess it must not be neglected, as it is desirable to grow fruit and not wood. It can be seen by measurement that much

room is wasted by profitless and barren shoots. With judicious pruning this need not occur.

The Royal Agricultural Society has, for the first time, offered prizes for preparations of fruit next year. It has been a long time recognising the fact that land produces other necessities than corn and cattle. We fruit growers have done very well without this recognition, which has come a little late in the day. It is, however, a step in the right direction. The advance of pomology during the last thirty years has been quite as rapid as the advance of agriculture, and we may be certain that there is no finality. Fruit-growing, I beg leave to state, is not the handmaid, but the helpmeet of agriculture, and I believe the best interests of the land would be served if landlords and tenants would meet to discuss the conditions under which they can advance the cultivation of fruit to their mutual advantage, and if these meetings were made public every village in England would be benefited; in time competent advisers would be provided, and as the interests are national, it is hoped that means would be found of advancing money at a low rate of interest. There can, I think, be no fear of the supply overtaking the demand, and it is certain that foreign competition would not prevail against home-grown fruit if produced in sufficient quantity and of good quality.

The production of fruit under glass requires capital and skill, and although not national is, and will become, an industry of great importance. Nearly forty years since my father proved that the cultivation of Peaches and Nectarines could be carried on in unheated glass houses with a certainty of success unknown to wall culture. The orchard house has now become an established fact. For some time before this system had been in full work the only early Peaches—that is, those ripening in July—were the Early Natmeg, the Early Ann, the Double de Troyes, all of them almost worthless except for precocity; now, however, we have ripening the 1st July, the Alexander, an American Peach, closely followed by the Early Beatrice, Early Louise, Hales' Early, Rivers' Early York, ripening during a month in which thirty years ago there was not a Peach worth having. During the months of August, September, and part of October there can be grown a continuous series of Peaches. The advance in Nectarines is equally conspicuous, the Lord Napier beginning a supply of Nectarines of high quality in August, which other sorts continue until the end of September, and ceasing with the Victoria. With these varieties, which were certainly not available thirty years since, an orchard house will give a continuous supply of Peaches and Nectarines for four months; a house 100 by 24 feet properly managed will produce over 3000 fruits of high quality. Such a house was built in 1855 at a cost of £147, and has produced for the last twenty-five years between 3000 and 4000 fruits annually. The cultivation of Grapes is advancing in our own islands with extraordinary rapidity, and although we hear complaints of the lowness of price, we do not hear that building Grape houses is declining; a good proof that no fear is entertained of the future prospects of Grape-growing.

**Cold Storage.**—The principle of cold storage is likely to be of very great importance in the future, and experiments are now being made with regard to the preservation of fruit under the influence of cold. Now I am convinced that if a low temperature cannot be usefully applied to keeping fruit, it may be made very useful for the storage of trees, particularly of Pear trees on the Quince stock. What I have to suggest is that Pear trees on the Quince stock may be placed in pots in a cold storage in a temperature not lower than 36° Fahr., and retarded until the middle of April. By this means the blooming season may be kept back until all danger from spring frosts is past. The fibrous roots of the Quince and the slow growth of the Pear render this class of fruit tree particularly suitable for this method; and as large Pears are worth in November and the succeeding months from 6s. to 8s. per dozen, cold storage, if possible, and if from trees can be provided, will

give a handsome profit. I tried some few years since to find a system which I could employ, but I was then offered small receptacles like a miniature chest of drawers, when I wanted room for hundreds of trees.

In Belgium it is customary to form clubs of fruit growers to compete at the various horticultural shows; the combination of growers enables each man to choose his own particular fruit to show with his club. These contests are very interesting, and would, I think, if carried out in England, cause much friendly rivalry, and advance the interests of pomology. I must conclude by saying I cannot, hold out any hopes of creating a large fortune by fruit growing; but it is an investment and an occupation which affords a more or less certain income, which will become more certain with improved means of preservation.

[Mr. Rivers' paper was followed by one on packing fruit by Mr. Webber, to illustrate whose remarks we introduce illustrations showing various methods recommended for adoption.]

#### PACKING FRUIT.

By MR. J. WEBBER, COVENT GARDEN.

IGNORANCE displayed in packing and want of knowledge of the condition in which fruit should be sent to market are the principal causes of loss to the fruit grower in this country. In packing we are far behind our continental brethren, for while they study not only the condition most suitable for travelling, but even the package in which the fruit is to be sent, we frequently send it too ripe, and make use of any package that may come to hand, with little regard as to whether it is too deep or too shallow, or will hold such quantities as are ordinarily marketable.

Packing is such an important factor in the attainment of good prices for market produce that it ought to be one of the essential points in the education of a gardener; for what is the use of growing the best fruit in the world if it be spoiled in transit? At least one-third of the hot-house fruit sent to market is depreciated in value, and sometimes rendered worthless, by the bad packing; whereas, if all came in marketable condition the price would be lower to the consumer, the supply being larger, and a better result all round would accrue to the grower. Bearing this in mind, I beg to submit the following remarks as applying to London markets.

There are three golden rules to be observed in sending fruit to market.

1st. Never send it too ripe. Peaches especially should be packed hard, as they travel better in that condition, and are rarely used by the shopkeeper till two or three days after purchase.

2nd. Never, if possible, send it for Saturday's market, as with the exception of Strawberries the retailer invariably provides himself beforehand with what he requires: Monday and Tuesday for the first part of the week, Wednesday and Thursday for the latter part. In hot weather, when fruit ripens fast, small consignments may be sent on Friday.

3rd. All fruit should be sorted into bests and seconds, and in some cases into thirds, as there are always buyers of bests, and buyers of seconds and thirds, but seldom buyers of mixed qualities.

**Grapes.**—Among hot-house fruits, Grapes being most important, as growing all the year round, claim our first attention. There are two sorts of baskets in which Grapes may be sent to market—viz., the "handle" and the "baby." The former (see Fig. 37, p. 293) is more useful for ordinary work and is safer as the handle is used for lifting, and to a certain extent is a protection to the fruit in preventing other goods being placed on the top. A little packing should be placed in the bottom of the basket, then a lining of white paper. The bunches should be packed close together, shoulder upwards, and the basket tied over with a sheet of stiff paper with a label "Grapes with care" on it. Grapes packed in this way will travel any distance. Special bunches travel in "handles," each bunch tied to the basket, without the centre being filled up. The latter mode is recommended in the case of special fruit only. The "baby" basket should only be used for short dis-

tances, and where a regular supply is sent, and where the railway porters are accustomed to them. It is more convenient than the "handle" for displaying in the shop windows, and shows off the fruit better. The basket should be lined with white paper and a little packing in the bottom, the bunches being simply laid in close together. The whole fits nicely into a hamper known as a "flat," and with the ordinary Grape label invariably arrives in good condition.

*Peaches* should be packed in shallow boxes of sufficient depth to allow a good bed to lay upon and a slight layer of packing on the top. The box should contain only twenty-four best or thirty-six seconds. Each fruit should be wrapped in soft paper. A very effective way of packing Peaches, so as when the box is opened the class of fruit can be seen at once by the buyer, is to roll a double slip of tissue paper round each fruit, leaving the crown exposed. This requires a sheet of paper to be placed over the fruit before finally filling up with the packing. I know of no packing better than moss, which should be properly dried and cleansed from all grit. It is cooler and more elastic than any other substance. Each fruit should be completely surrounded with it. Next to moss is bran, but care should be taken to shake it down well and refill the box before fastening the lid, as it settles down with the oscillation of travelling, leaving part of the fruit exposed and liable to injury. Wadding is not elastic, and is too heating.

*Strawberries* should be packed in boxes in single layers containing from 1 lb. to 1½ lb., according to size, each Strawberry being placed in a Strawberry leaf on a thin layer of moss, with only a light layer of leaves on the top. Each package of say five or six boxes should have a label, "Strawberries, with care, this side up," on the top of it. When the season is full on, they lose value if delivered after 8 A.M., as the trade then supply themselves from the "morning gathered," delivered by the growers themselves.

*Tomatos* should be packed in "handle" baskets containing from 18 to 20 lb., and should be well coloured, but not too ripe, otherwise they are apt to split.

*Outdoor Fruit.*—Suitable baskets for sending outdoor fruit to market can always be obtained of the salesmen. These consist of quarter-sieves, half-sieves, and sieves. The former hold 12 lb., and are used for best samples of all kinds of soft fruit. Half sieves are used for Cherries, Currants, Plums, Pears, and Apples. Sieves are used mainly for Apples. A half-sieve of soft fruit should contain 24 lb., of Plums 28 lb.; of Apples from 21 to 24 lb. Soft fruit should be simply stuck down with a sheet of paper. Hard fruit should be stuck down with dry packing, such as hay or straw. All fruit opens better with a sheet of paper covered over.

*Pears*, especially early varieties, should be sent directly they can be removed from the trees. On no account should they be allowed to get ripe. The system in vogue in France is well worthy of imitation by growers in this country. The fruit is carefully sorted, in many instances into four sizes. Cases are made to contain two tiers, each tier consisting of twenty, twenty-four, thirty, and thirty-six fruits. A layer of paper shavings is placed between each tier, and one top and bottom. When the fruit is extra large and kept late in the season, cases to contain a single layer of twelve and fifteen are used. If packed in half-sieves, the better sorts should be placed in layers with a little packing between.

*Carriage.*—With regard to the cost of carriage, little can be said here except that the rates, as we all know, are very unsatisfactory, little or no inducement being held out by the great carriers for the development of produce on a small scale. Special rates may sometimes be secured for regular consignments over 25 lb., but even then there is often a difficulty in keeping the railway company to their contract. All goods by passenger trains should reach the market by 7 P.M., so as to be ready for the next morning's trade, as if not they are seldom

delivered till after the market is over, and therefore lose in value.

Mr. SAMUEL RAWSON, of Birmingham, followed on the same theme, and was introduced by the Chairman, who said Mr. Rawson had earned the commendation of a great fruit man—Mr. Gladstone. In the course of his paper Mr. Rawson said anyone could grow fruit if they had the trees, the land, and the climate; but it was not everyone who could make

FIG. 34.—METHOD OF PACKING CHOICE FRUITS.

the best price of it by judicious marketing. They were all aware of the old adage, "Put the best side towards London," and knew pretty well what toppers meant; but it was very unfair to the salesman and the customer in town to top or face the baskets of produce with a few of the best fruit to cover idleness or carelessness in picking. This was often the

FIG. 35.—MOVEABLE RACKS FROM FIG. 34.

reason why many complaints were made of certain growers receiving bad prices. In France they managed much better. Perhaps it might be said that their dwarf pyramid trees and their cordon system of growing facilitated the picking, and the fruit was much freer from bruises; but did the English fruit grower ever trouble whether the fruit

FIG. 36.—PACKING BOX FOR CHOICE FRUITS WITH MOVEABLE TRAYS.

was bruised or not? No, he did not. In nine cases out of ten all he cared about was getting it off the trees and sent to market, and in many cases without even studying whether this or that sort ought to go to market first. One grower's packing would make double the price of another's if his mark had become known as an honest packer's. The French often realised more for 1 ton of their fruit than English growers for 2 tons. Why? The French did not begrudge employing labour, while the English grower growled and grumbled if he employed a few extra hands. Labour would and must pay. He related an amusing incident which came under his notice in Cornwall, and maintained that the way Strawberries were packed in that county was

abominable. Though they grew good and early fruit in Cornwall, it was spoilt before it got to market. Pounds of Strawberries were wedged into an old Orange box with a little Fern between each layer. He could not understand what the Fern was for, unless it was to cook them. The Fern was admirably adapted for "sweating" fruit. His opinion was that Strawberries ought to be sent to market on wooden trays about 3 inches deep, 2 feet long, about 15 inches wide, made to fit into each other in nests of six, with nothing over them except a lid on the top box, the trays to hold 12 lb. They could be carried about the beds. The whole six being bound by a cord, six dozen could be sold together. None but the finest fruit, unless in a scarce season, should be put in these trays. With respect to marketing, he thought that with extended fruit cultivation they would want extended marketing distribution or manipulation, or whatever they liked to call it, but it simply meant that the fruit must be disposed of in the most economical way. Salesmen would have to be provided with very large capital, and also the convenience for preserving the fruit and vegetables in superabundant seasons, by converting the fruit into jam or pulp, and preserving the vegetables in brine to provide against scarcity in crops for another season; besides, the surplus left from each day's sales must be manufactured into jam, pulp, or pickles, thus keeping the market clear and preventing goods being sold at those ruinously low prices that were obtained at the end of the market. It was to the manipulating of this surplus that the growers in an extended fruit cultivation must look for the profit they would reap for their trouble; and he would advise Fruit Associations or companies supported by capitalists and growers who could act as their own salesmen and to whom large jam makers could apply for their supplies of fruit. There was but one way of dealing with the produce with the most advantage to the seller, and to the immediate benefit of the people generally, and that was by a combination of the landowners, farmers, market-gardeners, fruit and vegetable growers, agricultural labourers and all classes interested to form companies or societies, properly and carefully organised and carried on in large centres, to provide for the reception and sale of produce, so that all classes might be interested in the success of such undertaking. To make such a company successful in any large centre was easy. It might be formed amongst capitalists as companies generally were formed, or it might be the parties specially interested who might combine to start and support it. The latter, he thought, would be the more profitable combination, as it certainly would be the more preferable, and in such a case he thought it should be a company, co-operative in principle, registered under the Companies' Acts and limiting the liability of the shareholders to the amount of their shares.

Mr. ROBERT SMITH (Yalding) read a brief paper on "The Packing of Apples," urging that if they wished to compete successfully with the foreign English fruit-growers must pay closer attention to the packing. He produced a specimen basket of his own design, which, being lined with felt, prevented the fruit from being bruised.

## LAND TENURE.

Mr. ALBERT BATH (Foot's Cray, Kent) read a paper on "Land Tenure in Relation to Fruit Cultivation." As a fruit-grower of twenty years' experience he knew a little where the shoe pinched. He might say in a few words that the reason why more fruit was not grown in this country was, not want of suitable soil or climate, but defective laws relating to agriculture. He had taken an active interest in endeavouring to obtain an Agricultural Holdings Act which would give the tenant full security for capital which he had invested judiciously. That the Farmers' Alliance had that object in its programme was his (Mr. Bath's) chief reason why he continued to act as its secretary. He alluded to a meeting held at Sydenham a few years ago, at which most of those present were fruit-growers, and where a resolution was carried

unanimously declaring it a measure affording the occupiers of land full security for the whole of the capital invested by them in the improvement of their holdings, was urgently needed in the interests of the tradesmen, labourers, and the community at large. For many years in the fruit-growing county of Kent there had been this want of security which had prevented farmers commencing or extending that important industry. Travelling through the States to Canada he found farms growing as many as twenty acres of Apples, and when he asked the probable market the reply was, "We are growing chiefly for the old country," meaning England. Those tillers of the soil in the States were owners of the soil, and therefore they had full security for their capital and no fear of landlords raising their rents upon improvements or of confiscating their property. He was not blaming the landlords; the blame rested on the tenant for not having sound and good laws to protect himself. They were only human beings, and if he were a landlord probably he should be worse than some others. At present, land which ought to be capable of transfer in an easy and inexpensive manner was too dear for the farmers to buy and cultivate at a profit. They must therefore have an alteration in the laws. Several Agricultural Holdings Acts had been passed professing to remedy the grievance, but none had gone to the root of the evil.

Lord Beaconsfield's Act of 1875 was of no use to the fruit-grower, as it excluded him from its provisions; neither was it of any use to the pure agriculturist. He farmed under three landlords, all of whom contracted themselves out. The Act of 1884, passed by Mr. Gladstone, though professing good to the fruit-grower and farmer, did not accomplish more than the Act of 1875. He (Mr. Bath) would suggest an Act of Parliament, under which the tenant might carry out whatever improvements he wished without the consent of the landlord, and when leaving his farm offer them to the landlord or the incoming tenant by what was called "free sale," and if the tenant planted good sound sorts of fruit he would get the value for his outlay. He had taken a holding on that principle, and found it very satisfactory to the outgoing tenant and to himself.

#### LORD SUDELEY'S FRUIT FARM.

Mr. J. W. BEACH (Brentford) gave a description of farm extension on Lord Sudeley's estate. He said that Lord Sudeley had five farms at Toddington, Gloucestershire, under fruit cultivation to the extent of from 800 to 900 acres, viz., Norton Field, Home Farm, Hales Farm, New Town, and the Leys. The aspects were west, south, and south-west; and was sheltered by the Cotswold Hills, the soil in some parts being heavy, of the blue lias, others of a light friable loam. One field occupied 166 acres, being planted with standard fruit trees in rows, 16 feet apart, and the same distance asunder, in some instances extending to the length of  $\frac{3}{4}$  mile. Space being strictly economised in the market garden style, the intermediate space was filled up with Currants, Gooseberries, Raspberries, and Strawberries. Bush Damsons were also planted in addition to the other standard trees. There were forty-four varieties of Plums, comprising about 300,000 trees, Damsons about 30,000, Raspberries also covered about 200 acres, Strawberries from 120 to 130 acres, Black Currants 212 acres, Cherries and Apples to the extent of about 70 acres, and Red Currants 50 acres. The fruit trees were very productive generally, with the exception of a few portions where they were attacked by blight when in blossom this season. The greatest quantity of fruit was used in the manufacture of jam, a large factory being erected at Norton Field Farm. Lord Sudeley was also giving his attention to the cultivation of flowers for market purposes, having erected a number of Belgian glasshouses, which were also suitable for growing Tomatoes, Cucumbers, Grapes, &c., and any kind of fruit which required protection. The baskets were also made upon the spot from the Osier beds on the banks of a stream running through the estate.

#### IMPROVING ORCHARDS BY GRAFTING.

By MR. J. MILLER, GARDENER TO LORD FOLEY, RUXLEY LODGE, ESSEX.

WHERE old fruit trees that are healthy and full of vigour are worthless for the market in a monetary sense, no time should be lost in grafting upon them new heads of an improved variety.

If the system of stock-grafting was better understood, especially out of the fruit-growing districts, worthless sorts will seldom be seen in the market, their place being taken by more profitable fruit. But to expect this to be done by the tenant, upon a yearly tenancy, is out of the question. To meet the difficulty to a certain extent, industrious tenants should be supplied with trees from the home nursery, or could be supplied by the trade at small cost, the tenant being under an agreement to protect them. Stock-grafting is easily done, but the system requires to be known. As done in the fruit districts by local grafters, each workman bears a degree of merit as to his success. When once known, none need be afraid to cut off the third part of a worthless tree any time during the winter months, cutting it ship-shape in order that the grafter has little to do when the season comes but to square the ends of the branches and insert his grafts. The season for grafting large trees is rather an unsettled question. I may state that we had great success last year at Ruxley Lodge in grafting old trees, and the strong shoots which I exhibit speak

FIG. 37.—BASKET FOR PACKING GRAPES.

well for the system. The heads were cut off the trees in the month of February, and grafts were secured about the same time, and laid by the heels in a shady place to prevent any premature growth. The grafts for this require to be clean, and free from American blight and canker, from two to three years' growth, and in size about the thickness of one's second finger. The specimens of shoots which I produce were simply short grafts a year ago last May, the whole of the grafting being done in the last fortnight of the month. The work has only been done about sixteen months, yet the shoots have had two seasons' growth, and reach nearly 10 feet in length; some of the stronger sorts are even longer. Upon a close examination some of the strongest shoots may be seen to be showing fruit buds, and if we should be favoured with a fruitful season next year I have no doubt, from present appearances, we shall have a fair show of fruit. Stock-grafting does not require to be commenced so soon as small whip or tongue grafting. The general order is—Cherries first, Plums next, finishing up with Pears and Apples.

The tools which are required for the purpose are but few—a pocket knife, a shoemaker's knife, a tenon saw, and a small mallet.

A branch 2 inches in diameter requires two grafts to thoroughly unite the end of the branch; one of 4 inches, three grafts; and so on in proportion. A stock or head of 9 inches requires seven grafts in order to keep the head living until the leading

shoots form the new tree, then all weakly and ill-placed shoots can be cut away. There is no particular secret in manipulating the end of the branch to receive the grafts further than shaving away a portion of the rough bark, so that it may better match the thin or inner bark of the scion, which ought to be placed so as to accurately face each other. Daubing or claying up the grafts is no doubt of some importance, especially for small grafting. For trees grafted upon the stock principle the daubing material may be of a coarser nature than for the whip or tongue grafting. Good clay with a proportion of tough hay, well compounded together, and thoroughly worked in and round the grafts to prevent its being washed off by the weather, is all that is required for stock-grafting. I may here state that heading the trees at the proper time and securing and properly keeping the grafts is of quite as much importance as carrying out the work.

#### DISCUSSION.

MR. A. DEAN (Bedfont) opened the discussion by proposing on behalf of the Executive Committee a vote of thanks to those gentlemen who had kindly read papers. He did not think fruit-culture would save agriculture from drowning, but it would do something to help it to swim. If they were to believe the statement that £250 per acre could be made by fruit-growing, such a sum represented an Eldorado. It had been mentioned that the Royal Agricultural Society proposed to offer prizes in connection with certain fruit-products at their Windsor show. That might be advantageous, but he could have wished that the Society had offered prizes for something better than such wretched products as cider and perry. They had heard a striking eulogy about their continental brethren in regard to their preparing and packing fruit for the market. Englishmen, he thought, had been in the past a little too egotistical, and he trusted they would gather lessons from the facts placed before them.

MR. A. H. PEARSON (Chilwell) said the great idea seemed to be Covent Garden, but it was a great mistake to rush their fruit into one centre. He could obtain a better price for his fruit, milk potatoes, and other produce, than if he sent them to markets already too congested. He concluded by seconding the resolution.

MR. FOWLER (Aylesbury) urged that it was of great consequence that some means should be adopted for the preservation of fruit. He referred to what Messrs. Crosbie and Blackwell had done in this direction, and produced for inspection metal, glass, and stoneware airtight vessels. They need not despair in fighting the foreigner in every way.

MR. P. VEITCH regarded the Chairman's paper as giving a right basis for discussion; but if the Chairman had given them a hint as to what fruit to grow on fairly good soil, he would have done them a service. Mr. Dean had spoken severely of perry and cider, but cider apples gave a good return to the farmer. He (Mr. Veitch) had no doubt that calling attention to artificial manures would do a good deal of good, especially if such manures could be obtained at anything like a reasonable price, so that they could be used on an extensive scale.

MR. READ (Weybridge) thought they should grow such fruits as would yield the quickest return for labour.

MR. JAMES pointed out that there were thousands of acres of English land at present lying uncultivated; and until an alteration in the land laws had been effected, they would not see the state of prosperity that every one desired. He would like to see conferences of this kind at every flower show.

MR. J. R. HALE (Thornton Heath) attributed present difficulties to the extraordinary tithe; and the sooner the tithe question was fairly met and settled, the better for fruit-growers.

MR. REED (Norwood) said the eternal slumber which had settled upon the British farmer was incomprehensible. He trusted this would be the forerunner of many assemblies of the kind.

MR. D. T. FRIS (Bury St. Edmunds) wished the

Chairman would supplement his analysis by a list of the best sorts of fruit to grow on poor soils. Not only should the farmer be encouraged, but the labourer also should be encouraged to grow fruit. The best Nonsuch Apples he had seen were grown at the end of a cottage, with no soil at all, but in a hard gravel walk which had never been disturbed in the memory of the oldest inhabitant. They were fed by the slops of a small household, and were the finest, the reddest, the most luscious, he had seen from that day to this. It ought not to be beyond our legislators, or the suggestions of Conferences like that, that some means should be devised for giving the labourer more soil.

Mr. GEORGE BUNYARD (Maidstone) thought the manuring of orchards and cold storage were subjects which they must work round.

#### FRUIT DISTRIBUTION.

The following paper on "The Science of Fruit Distribution" was read by D. Tallerman, Esq., on Saturday:—

Of the various means available to fruit growers for the disposal of their crops, that by which they can be brought within the reach of consumers in a full-flavoured, fresh, and bright condition is the one which will leave the most profitable results to the producers, and lead to the most successful permanent development of the industry in which they are engaged. Fruit may be preserved, pulped, evaporated, refrigerated, or manipulated in any other manner that will enable it to be converted into a merchantable commodity possessing a distinctive cash value, but there yet remains the undeniable fact that it is in its fresh ripe condition, while clothed with its undisguisable natural bloom, endowed with its fragrant aroma and luscious flavour, that fruits have their highest and best values; therefore, the most important subject that can occupy the minds of fruit-growers is, how they can best place their produce within reach of consumers in that inviting condition, in order to acquire the full benefits that accrue from it. The subject naturally involves a consideration of the means of rapid and effective distribution which are absolutely essential to secure successful results.

The science of fruit distribution is necessarily a commercial study, and comprises the principles that growers should practise to place their produce within reach of consumers.

1. When and where they may be required.
2. In the best possible condition.
3. At the least possible cost.

The means by which these measures, simple as they appear, can best be successfully attained, involves attention to matters of detail, the necessity of which will be readily acknowledged by all engaged in fruit growing and marketing; but to ensure a beneficial result from the consideration of the subjects which we are assembled to discuss, it is necessary to treat the various branches of the trade from specific and not general points, inasmuch as although the general condition of the subject may be speedily summarised, that will not bring us any nearer the position we hope to reach. Briefly, then, we are a large community existing in a small space. Fruit consumers abound in all directions, fruit producers are to be found but in few places. The consumers are counted by millions, the producers by hundreds. The consumers require all the fruit that is grown and more; the growers do not profitably sell while fresh the yield of their orchards, and are driven to seek other outlets in order to secure even a nominal return for their crops. It must be borne in mind that the circumstances and conditions that surround individual growers and consumers vary very largely, and courses of procedure that would bring advantageous results in one direction would be inadvisable in another.

With growers we have a wide range of conditions to deal with, from the owners of the numerous old orchards of large acreage to which little or no attention is given, to the cultivators of small quantities of fruit under glass or in the hothouse, which are the subject of incessant care and watchfulness.

With consumers we also have an infinite number of conditions which embodies a still wider range of thought; from the wealthy members of the upper classes who require, and will have at all times if procurable, for their tables regardless of cost, any fruits that may be rare, choice, and of fine quality, to the buxom matron who buys a couple of pounds of whatever fruit the costermonger may have on his barrow, so that her husband's and family's dinner may be complete with its dumpling or pie. Every variety of condition has to be met with and provided for, therefore it must be evident that the more these existing and varied circumstances are understood, and the nearer they can be met and provided for, the greater must be the benefits that will accrue to fruit producers. It is in the study of the numerous features that present themselves, and the determination of the most advantageous manner in which they can be encountered and dealt with, that comprises the science of fruit distribution. This opportunity does not enable me to enlarge upon the whole of the subjects which are naturally affiliated with the question, therefore I content myself by indicating the direction to which attention may be advantageously given.

With respect to the first point—viz., the disposal of fruits, when and where they may be required—I would point out to growers that with the exception of the county of Kent and the Metropolis, the centres of fruit production and fruit consumption are not contiguous to each other. By an inspection of the diagram of the kingdom, showing the population and the fruit area of each county, it will be seen that the bulk of our fruit supply is produced in a very few districts, while a large portion of the country which is densely populated is devoid of any fruit produce of its own locality but relies upon other districts, and that the people gladly purchase any quantity of fruit that may be brought to them in good order and condition. That this position is undeniable may be gathered from the results that have attended the efforts of a few private parties who have relinquished the old practice of sending to the markets of Covent Garden, the Borough, and Spitalfields, and despatch their fruits instead to Manchester, Bradford, Leeds, Glasgow, and other largely populated northern towns, where they have made a profitable outlet for a large quantity of fruit that otherwise would have helped to glut the London markets. There are an enormous number of small towns in the mining and manufacturing districts that would welcome a supply of fresh fruit which they do not now obtain. In order to directly meet the requirement of these towns it is desirable that the fruit growers of each district combine with each other and organise themselves into local societies in order that they may be in a proper position to ascertain what fruits they have to sell, when they will be ready for gathering, and then ascertain the requirements of particular districts and what they are likely to buy, so as to enable them to take steps to supply them. It is not possible to attain this position by individual action, for no single grower could supply from his own crops the particular requirements of the traders of a town; but these requirements, if once ascertained, which they may be in a general sense, could be furnished from the crops of several growers.

Where local organisations are thus formed they could readily communicate with the central organisation that has been formed to place itself in communication with the traders of all districts, in order to simplify the distribution of food products, and they, by ascertaining the probable fruit requirements of a district, and having a knowledge of the crops of fruit that were available in many localities, could arrange to dispose of and deliver them direct from the orchards. The defect that fruit growers suffer from arises from the fact that while their transactions are naturally of an individual character, and must remain so, they have had no recognised central representative organisation who could collect information from varied districts as to their possible fruit requirements, and disseminate the knowledge among those who had the fruit to dispose of, and also

arrange many other subjects of interest and importance, such as packages, railway rates, transmission, &c., all matters small in themselves and readily adjustable, but each of which forms an indispensable connecting link in a commercial chain, without which a transaction cannot be carried through. Hitherto fruit growers have left everything with their salesmen, whose interest it is to collect and retain all the information, and to obstruct any course by which the consignment of the fruit to themselves would be interfered with. They therefore have a vested interest in obstructing any movement that would have a tendency to impart to growers any information that would advise them when and where fruit was required, which is the keystone to the system of direct distribution.

The second prominent feature incidental to scientific distribution is the delivery to consumers just what they want in the best possible condition. The interests of sellers will be considerably advanced by full attention being given to this subject, which presents many features requiring careful consideration and forethought, that without in any way adding to the costs of cultivation and delivery may materially aid to increase the amounts receivable for the fruits.

Be it remembered that no fruits grow exactly all alike, as bricks are made, but every tree or bush will contain some fruits of a more or less choice character. Wherever these can be selected they will, if packed by themselves, realise a much larger proportionate price without interfering with the price of the whole crop. There are different classes of buyers in all perishable food products, and more especially in fruits, and there are different members in each trade who supply the requirements of buyers. Anyone going into an average sized orchard when the fruit is ripe and ready for gathering will, upon examination, discover choice specimens fit for an exhibition or the window of the highest class fruiterers at the West End of London. Other fruits may be seen that, by themselves, would furnish a reasonable supply of more than a general character. Further, there will be seen the remainder of the growth suitable for the costermonger's barrow or the jam pot. If they remain while the fruit is gathered they will see it all packed together in such a way that no regard is paid to the choice specimens of fruit that may be there, but they are so dealt with that they will find their way to one destination, which, as likely as not, may be the costermonger's barrow. This is the mistake that growers make, and where they unknowingly suffer material loss.

The disposal of green fruits is necessarily a matter of commercial experience, and to attain best results all fruits should be properly assorted and classed as to character, condition, and description—this in America is called "grading." Fruits thus dealt with and placed in packages of a uniform size enjoy a marked advantage in their disposal, as buyers at a distance may order them by description, while at present they can only be purchased by personal attendance and sight. The South of Ireland and the North of Scotland furnish examples of the great value attaching to the proper classification of perishable produce, for it is to the independent branding of butter at Cork and herrings at Wick and the other Scotch fishing ports, that have brought the trades of those districts to their present high stage of development, for it is owing to the facility which the storekeeper in the colonial bush can send to his merchant in London for what he requires in Cork butter, either in firsts, seconds, thirds, or fourths, knowing exactly what he will get, and can learn the current market price on the day of purchase. So also the grocer of an inland town in eastern Europe can send to his Hamburg agent for so many barrels of Scotch herrings, and can order "Crown Fuls," "Spents," or "Matties," and his exact requirements are supplied owing to the wise precautions those in the Scotch herring trade have adopted, by which not only are the character of the contents of their barrels known by description all over the world, but the single fisherman with his few barrels of herrings enjoys an equal position with

the largest factor of the district, and can readily obtain the market price of the day for his small supply when they have once been examined and branded by the appointed officials. This should show fruit growers the advisability of their combining for the purpose of establishing a definite basis upon which their produce should be classed and uniformly packed, by which the contents of a package would be known to wholesale and retail dealers without a personal inspection. For this purpose fruits should be properly sorted and classed as to character and condition into—

1. "Choice," for special high-class trade; "Prime," for first-class trade; and "Ordinary," for general trade.

2. Assorted as to description into firsts, seconds, and thirds sizes.

3. Choice and prime fruits should be packed into clean, bright, and carefully made packages, so as to present to the buyer a luscious, attractive, and tempting appearance. Ordinary fruit may be packed for general sale in smaller baskets than at present.

4. It is important to act on the principle that the smaller the package the wider the area of consumption, and the better the contents will keep in good order and condition.

5. Also, that selection as to size and colour with regular packing are the best means for ensuring speedy sales in extended districts at good prices.

6. Growers should remember and act on the fact that a barely perceptible taint or speck that is carelessly dealt with by the packer at the farm will in a short time become an odious blemish, and by the time the fruit reaches the market, not only becomes spoiled itself, but damages other fruit, and spoils its value.

7. A good crop requires marketing with commercial experience and judgment. A combination of growers to amalgamate their crops in order that large selections of particular descriptions may be made available for disposal in special directions, and in districts where required, will lead to larger prices being received.

8. Specially choice goods, suitably packed for display in retailers' shop windows, will at all times command extreme high prices.

9. Inferior specimens of fruits packed with prime specimens, reduce the value of the prime.

10. Goods packed, branded, and numbered, that their contents and condition may be known without a personal inspection, will be sent for by purchasers in remote parts, whose convenience or ability does not allow them to attend a market personally.

The simplicity, ease, and readiness by which these apparently complicated measures may be speedily carried into active existence will be promptly seen by a glance at a package that has been devised for the purpose, which lends itself in every way to the proposed condition of things, for inexpensive in production it is effective in character, as by its means fruits may be classed, packed, and safely transmitted to any part of the kingdom in large or small quantities, where they will arrive in better condition, and remain so longer than if packed in bulk as at present, also may be disposed of to the individual consumer without any handling and consequent deterioration [see our issue for August 4, last, p. 135, for figure of a fruit transit box. Ed.]. The inexpensive character of the package is its valuable feature, and that is 6d. per dozen for the boxes and 5d. for the crate to hold twenty boxes. Their lightness renders the cost of transport less than in the heavy baskets, which have to be sent backwards and forwards, while fruits selected and packed in this manner would be deliverable in the best possible condition and of the highest value. Thus the second material feature in the science of distribution would be complied with.

The third feature to which attention may be directed is the transport of fruit at the least possible cost. I do not propose to occupy time by referring to that great evil, the excessive railway rates, which the producers and consumers of the country have so long suffered from. The short-sighted policy

of the railway authorities is about to be brought under consideration, and our purpose will be best served by attention being directed to the particular points that fruit growers should endeavour to secure for themselves in the forthcoming revision of the charges and conditions of our railway system. In this matter, so far as fruit is concerned, facilities for its effective collection, safe transport, and speedy delivery, are of a much greater consideration than the actual charge made for the services rendered, but this should certainly be a figure *vitæ* reason; but the principal object that the agricultural classes generally, as a body of producers, should seek to obtain, is a ready means for reaching consumers in all districts through the existing retail traders. For this purpose they should seek for the establishment of a "farm produce train," a service to be carried through on the lines of the "parliamentary train" and the "van train," which was in existence for a number of years, and only recently abandoned. By the parliamentary train the passenger rates for one train daily was fixed by law. The van train was for parcels, and the rates were made by the railway companies themselves, being one-half the ordinary parcels rates. With a minimum of 6d. at the present time, a parcel traffic is in existence on all railways by passenger trains, and this is governed by radius of distance: up to 30 miles being ½d. per pound; up to 50 miles ¾d. per pound; up to 100 miles 3d. per pound, with a minimum rate of 6d. for a parcel. A moderate extension of this parcel system to wider radii on the basis of the van train charge—that is, one-half the current parcel rates—would prove advantageous to farmers, and bring the railway a large and remunerative traffic. This should be sought for, and would probably be conceded by the railway company without difficulty.

The outlet for fruits will be found in two directions which have a widely different character, and necessitate different treatment—the supply of London and the very few large towns in the north, and the supply to the small towns and villages throughout the kingdom. With the first we have the large concentration of fruiterers, greengrocers, and costermongers, who have hitherto furnished the means for reaching the public. With the second they have to a great extent done without fruit, as it could not be supplied in a fresh condition. Whether the fruits are intended for London or the country districts, railway companies should be compelled to provide effective refrigerator trucks for their conveyance, in order that its fresh condition may be fully maintained. Growers know the condition that fruits leave them, but they are not aware of the serious deterioration that takes place in transit before reaching their destination, and the consequent enormous depreciation that takes place in values. A few hours makes a great difference in the appearance and flavour of fruits, and there can be no possible justification for the unnecessary loss thus made to the detriment of the grower, when the fruits could be readily and inexpensively retained in a fine and fresh condition.

In America the fruit farmers of California and Florida, the extreme western and southern States, send their fruits 2000 and 3000 miles across the vast continent to the markets of New York, Baltimore, Boston, Chicago, &c., where they arrive in fine condition, after several days' travel, and invariably bring good results to the grower; while in this country a fruit grower cannot send his produce a few miles with any certainty of its reaching its destination in a presentable condition, and if he wishes to send any distance other than where an ordinary fruit train runs, there is almost a certainty that it will be useless when it arrives at its destination. This deterioration and its consequent loss is more than a personal loss of the particular sender—it is a diminution of the food supply of the people, and in that light it is a national loss, needlessly incurred, by reason of the negligence and want of care on the part of those who have acquired the right to transport the internal food supplies of the country—a loss which is readily preventable by the use of proper trucks, which the railway

companies should be compelled to provide themselves, or allow others to provide for them. The companies should also be called upon to accept a truck rate for agricultural produce irrespective of contents. This would enable fruit and other farmers to load trucks in proximity to their farms or on railway sidings with their own labour, and while saving charges send their produce direct to the market. The provision of a regular and effective daily service for the conveyance of parcels of food produce in refrigerator cars, at a reasonable advance on the ordinary goods rates, would materially facilitate the communication between producers and consumers, and lead to marked advantages to fruit growers. To simplify matters, the rates by this produce train might be fixed within given areas. Thus all within a radius of one hundred miles one rate, and each additional hundred miles an additional rate. This would bring most of the agricultural districts within reach of populous towns, and thus furnish them with an outlet for their produce. That this system would be advantageous to fruit-growers may be readily seen, for grocers, dealers, or even consumers in any small town might order any number of the packages of fruit from one upwards, which, packed on the orchard and transmitted by the refrigerator cars, would reach their destination direct, at a small cost and in good condition. The essence of the fruit trade is a multiplication of individual transactions small in extent but numerous in character. It is in the simplification of the distribution of these growers will be in a position to place their produce within reach of consumers at the least possible cost, and thus acquire a further insight into the science of fruit distribution.

In conclusion, I submit—

1. That the simplest and most profitable way to sell fruits is in their natural condition properly classed and packed.

2. That an ample demand can be ensured for an unlimited quantity from numerous districts in all parts of the kingdom.

3. That these can be best approached and dealt with by local combinations of growers either direct or through a central agency.

4. That whatever prices are determined upon should be publicly known and fixed to give retailers a profit.

5. That the railway companies should be moved to furnish a daily farmer's produce parcel and bulk train service for the carriage of food products in refrigerator trucks between the agricultural and industrial districts at reasonable package and truck rates.

With the supply of these facilities a demand would be created for their utilisation, and thus bring about an improved condition of all things in which the interests of our agricultural and industrial classes are entwined.

## NEW OR NOTEWORTHY PLANTS.

### PHALANOPSIS BUYSSONIANA, n. sp.\*

A STALKY plant, very much like *P. Regnieriana*, but with far brighter colours. The leaf and inflorescence are not distinct. Both the sepals and the petals are of a bright purple hue; the lateral sepals are bordered inside with white. The petals are much broader than those of *Phalanopsis Regnieriana*, and appear always to be hooded over the column. The lip is very distinct. The processes on the stalk of the lip are median, filiform-linear, not triangular, as in *Phalanopsis Regnieriana*. The three spreading laciniae of the anterior part of the lip are equal, lanceolate-oblong, blunt-acute. There is an emarginate small callus at the beginning of the stalk, and in front of it stands on

\* *Phalanopsis Buyssoniana*, n. sp.—*Similima affinis Phalanopsis Regnieriana* mento paulo argutiori; sepala tepalisque latioribus, labelli auriculis unguicularibus lineari-filiformibus, callo in apice unguis bilobis parvis, lineis linearibus incrassatis, bisulca antepetala lacinias oblongolanceolatis obtuse acutis, lateralibus divaricatis, omnibus equalibus; columnae basal angulata. Ab exc. A. Regnier introducta cl nobili Comiti Du Buysson dicata. H. G. Rehb. f.

the disc between side lacinia a thickened line with two furrows. The three lacinia are of a vivid scarlet colour inside, side lacinia outside ochre-coloured, with numerous scarlet lines.

The stalk and keels are white, with some tinges of purple. Column ochre outside, angular at the base on both sides. M. A. Regnier, 44, Avenue de Marigny, Fontenay-sous-Bois, Seine, has sent me not only some specimens, but has written with his usual courtesy to say, "Vous donnerez, le nom qui vous sera plaisir." It gives me great pleasure, therefore, to acknowledge the assistance given to orchidists by M. le Comte François Du Buisson, the author of the useful *Orchidophile*, &c. To help others is the privilege of those who have "le feu sacré." *H. G. Rehb. f.*

#### *SOBRALIA MACRANTHA* (Lindl.) KIENASTIANA, n. var.

As long since as 1885 my excellent correspondent, Herr Consul Kienast Zölly, Hirslanden, Zurich, sent me a dried flower of a *Sobralia macrantha*. His Indian collector described the bloom as "very large and very white." It is large, but as to the colour, it has that hue white flowers usually have when dried. I put it in my herbarium, the grave of so many unsolved orchidic riddles, to wait until more materials came to hand. And this month a fresh white flower arrived with a small narrow sulphur-coloured mark on the lip under the column not much larger than the circumference of the column. It is a well-known fact that we are very unfortunate when we attempt to copy the green colours of leaves, &c., and it is nearly impossible to get shades of white. Not many persons have eyes to perceive the gradations to which white is subject, and also these shades do not appear to exist in the materials which we use when trying to represent the numerous variations of white. The white colour of this *Sobralia macrantha* Kienastiana is quite *hors de ligne*, of the most exquisite purity, surpassing all shades of white I have seen in plants. (I knew an English artist who when making water-colour drawings of Orchids represented all white flowers of a light blue tint—*grand bien vous fasse*.)

I learn that the plant (*Sobralia*) is still small, not more than 20 inches in height. I was much pleased with the flower, and have great pleasure in dedicating it to one of the most intelligent and zealous of orchidists. My Consul Kienast Zölly enjoy a long life. It may be a benefit for orchidology. *H. G. Rehb. f.*

#### NARCISUS SCABERULUS.\*

In a footnote is given a translation of Professor Henriques' description of a new Portuguese *Narcissus* closely allied to *N. rupicola*, and of which specimens are in cultivation in Dublin and elsewhere. *A. W. T. Oporto*.

#### ZYGOPETALUM MURRAYANUM, Gardn., hybrid.

This is a very curious species of *Zygopetalum*, and one but rarely seen in gardens. Until the other day I do not think I had seen the plant alive; when a portion of an inflorescence was forwarded to me by Mr. B. S. Williams, it having been sent by one of his correspondents for a name. The plant has the general habit of other members of the genus,

\* *Narcissus scaberulus*. Henriques, n. sp.—Bulb small, 15 mm., ovoid tunicate, outer coats brown, inner ones white; leaves 2, linear, more or less prostrate, longer than the scape, slightly furrowed on the upper surface, 5-angled beneath, glaucous, rough at the margins and dorsal angles, provided at the base with a membranous involute sheath; scape, 6-10 cm. long, 1-2 mm. in diameter, striate, nearly cylindrical, bent, 1-2-flowered; spathe membranous, narrow, striate, slightly longer than the peduncle and ovary; flowers 12-15 mm. across, stalked (stalk, 8-12 mm.), bent, yellow, tube 12-17 mm., greenish; perianth-segments ovate, imbricate, 3 mm. across, broadest apically, slightly fringed at the tips, spreading ultimately slightly reflexed; corona 5-7 mm. across, cup-shaped, almost the same size as the segments, more or less crenate at the margins; filaments very short, 1 mm., three emerging from the centre of the tube, three from the mouth; style filiform, stigma 3-lobed. At Oliveira do Conde; flowers in March and April. Allied to *N. rupicola*, from which it differs in the prostrate rough leaves, the bent flowers, the sub-cylindric corona, and the three exsert stamens.

bearing an erect raceme of several flowers; but these have a highly singular appearance, owing to the total absence of markings on the sepals and petals. These organs are of a uniform bright green, while the lip is white, with a few reddish-purple markings near the base. The front lobe is somewhat elongated and rather narrow, the side lobes are smaller and rounded, while the fleshy callus is quite characteristic of the genus. The column is greenish-white, with a few streaks of red in front. The reappearance of the plant in gardens is interesting, for it originally appeared as early as 1839, being figured at t. 3874 of the *Botanical Magazine* from a plant which flowered in the Glasgow Botanic Garden. This plant was sent home by Gardner from the Organ Mountains, in Brazil, where it was found growing at 4000 feet elevation. The present plant is probably from the same region, and is of a deeper green than the one represented in the above-named plate. *R. A. R.*

### HARDY ANNUALS AS EXHIBITION PLANTS.

WHEN attending a flower show in the West of England a few days ago I was pleased to note some very attractive stands of bunches of annuals shown in a class in which special prizes were offered for them. The flowers were arranged in neat and yet attractive bunches, and they were nicely set up in a stand, each type being seen to the best advantage. Not only was the floral effect good, but the exhibition served the purpose of presenting to view some very pretty things in the way of annuals that are not seen so much in gardens as they deserve to be. I noticed that visitors to the show gathered about the stands, and appeared to greatly admire the flowers, and I think many of them were looking upon subjects they had perhaps never seen before, or on rare occasions only. Annuals are rarely seen at flower shows unless it be some that are known as half-hardy or tender annuals, such as Balsams, Cockscombs, Zinnias, &c.

Two things should be stated at the outset. The schedule of prizes containing the classes above referred to stated "Bunches of Hardy Annuals." Zinnias, Stocks, Asters, and a few other things that it has been customary to raise the seeds of on a slight hotbed were shown, and were admitted, because we have abundant evidence that in many parts of the country seeds of these can be and are sown in the open ground, and they germinate abundantly; and they flower very finely where they were sown. I think, therefore, that all annuals that can be treated in this way should be considered hardy.

Another point is, that exhibitors are very apt to spoil the effect of their stands by placing several varieties of one genus, or species, in a bunch. The schedule reads, "Twenty-four bunches of hardy annuals, distinct varieties." I dare say what was in the mind of the framer of the class was, that each bunch should consist of one variety of flower only. But country exhibitors are very apt to, and indeed often do, confound species and variety, and place several varieties of Sweet Peas together in a bunch, in the full belief that they are exhibiting in harmony with the requirements of the schedule. This is a frequent practice at country exhibitions, and it seems hard to disqualify under the circumstances. It would perhaps be better if the schedule of prizes stated, "one variety only in a bunch." A stand composed wholly of bunches of one variety, if the variety be good, is certainly much more effective than one which has several varieties placed in a bunch.

Being sincerely desirous that the culture of some of the more showy and useful class of annuals should be encouraged for this and other purposes, I venture to give a list of those best adapted for the purpose; at the same time they are well adapted for general garden decoration. They are Asters of the quilled, Victoria Peony-flowered, and bouquet types, including that fine introduction of the Victoria section, Comet, which is as dis-

tinct as it is fine; *Bartonia aurea*, yellow, a fine and showy early flowering hardy annual; *Calliopis* or *Coreopsis coronata*, tinctoria, grandiflora, and nigra speciosa; Candytufts, new Carmine—the giant white variety, Empress, and Dunnett's Crimson; *Chrysanthemum coronarium*, double and single; *C. tricolor*, and such fine varieties as Burridgeanum, W. E. Gladstone, and Lord Beaconsfield; *Clarkia pulchella* integripetala and its varieties limbatia and Mrs. Langtry; *Collinsia bicolor* and violacea, *Convolvulus major*, and the rich dark blue *C. minor*; *Dianthus chinensis*, its fine variety Hedewigii, also Brilliant and Eastern Queen; *Eschscholtzia californica* alba, crocea, and Mandarin; *Godetia* The Bride and Whitneyi; the crimson and purple double Jacobaeas, the blue branching and dwarf Rocket, Larkspur, *Lupinus nanus* and sub-carnosus, *Malope grandiflora* and its variety rosea, dwarf striped French Marigold, the Crimson Giant Golden Queen, and Parson's Giant White Mignonne, which should be well grown in order to have fine spikes; *Nasturtium*, climbing and dwarf, but the finer varieties only should be grown; *Nemophila insignis* grandiflora and maculata, *Nigella damascena* and *hispanica*—the former especially makes a charming bunch; the annual Poppies, such as the Danebrog among the singles, and The Mikado type among the doubles; Sweet Peas in variety, the beautiful blue *Phacelia campanularia*, unrivalled among annuals for its rich blue; *Phlox Drummondii*, the finest varieties, and especially the rich crimson splendens grandiflora: some of the most showy of these make charming bunches; *Salpiglossis*, with their rich orange, amber, purple, and other hues; *Schizanthus pinnatus*, Stocks in variety, and especially such distinct colours as crimson, purple, rose, chamois, violet, white, &c.; *Viscaria cardinalis* and oculata corulea, *Whitavia gloxinoides*, and the fine double forms of *Zinnia elegans*.

Should this list be considered too long, let me say that if twenty-four bunches be required in distinct varieties, it is necessary to grow a good selection; all that I have named are good and distinct, and what the grower should aim at is to have a batch of varieties in flower and at their best just when they are required.

But it must not be supposed that good flowers of common annuals are to be had in any soil. I think very little cultivation is given to many annuals. If they are to be fine they must be cultivated, and to do this properly they should be grown in a nursery bed. The soil should be deeply dug and manured in autumn, and then thrown up rough for the winter. In February the surface should be levelled, gently forked over, and thoroughly well pulverised, and the seeds sown as early as possible as opportunity offers. When the plants are growing into size let there be a courageous thinning out, giving each plant ample room in which to develop. Displays of annuals are too often spoiled by the plants being allowed to grow much too thickly, and they starve and smother each other. The aim of the cultivator is to have the largest and best developed flowers possible, and in doing this he will be making it possible for him to excel on the exhibition table. *R. D.*

### THE WEATHER.

THE weather of the past three months of June, July, and August, has shown a striking contrast with that of the corresponding period last year; in fact, a more marked difference it is scarcely possible to conceive.

According to Sir J. B. Lawes' meteorological records at Rothamsted, the three months of June, July, and August—which may be termed the months of English hay and grain harvest—last year gave us but 2½ inches of rain, while the same three months this season have given us over 12 inches, or a quantity which is equal to the enormous amount of 1223 tons of water to each acre of land; this is 469 tons in excess of the average of thirty-five years, over which the Rothamsted records have extended

and 1066 tons per acre more than we received in the corresponding period last year.

This large rainfall is, however, not without precedent in the neighbourhood of Rothamsted, for in the three months of June, July, and August, 1880, over 12½ inches of rain was recorded, and in 1879 nearly 16½ inches were measured.

The characteristic of the present season is that not one week of continuous fine weather has been experienced during the whole of the three months to which we have referred. With the high rainfall has been registered an exceedingly low temperature, an average of 57°·3 only being obtained for these three harvest months. This shows a deficit from the computed average of 22°·9, and is in great part due to the comparative lack of bright sunshine experienced during the present summer.

Although there was an increase of warmth during August from the two preceding months, yet it was of dubious advantage when accompanied by a damp, close, and unhealthy atmosphere, extremely suitable to fungoid growth on the crops. We do not remember ever to have seen such an enormous quantity of frogs and toads crawling about the fields as in the present season.

The inclement weather for ingathering has had the result that a very large proportion of the hay crops of an inferior quality, much being so damaged as to be almost worthless; though the promise of an abundant aftermath may make some amends, if only suitable weather could be obtained for its successful curing. Peas and Beans have run more to haulm than to pod, and the growth of root-crops, both in the garden and in the field, has been out of proportion to the development of the bulbs, which require the moisture to be tempered with bright sunshine for successful growth.

Potatoes have suffered in this neighbourhood greatly from the superabundance of moisture, blight, and disease, being extremely prevalent. In some cases, at lifting the crop two-thirds of the tubers have been found useless. All outdoor fruit is very insipid and watery, but especially is this the case with Plums.

Although bad seasons in our own country do not now imply famine or starvation, as formerly—as any deficiency at home can be so expeditiously supplied, and at such a comparatively trifling cost of transit from the most remote quarters of the globe—yet we fear many will feel the pinch of poverty in the coming winter. *J. Willis.*

## THE APIARY.

### ROBBING.

THIS will now be the order of the day, if great care be not taken to prevent it. It is mostly allowed that prevention is better than cure in any case, and it certainly is so here, for if once robbing is established it is difficult to stop it. After such a season as we have had, no stock can possibly be overloaded with honey, and most stocks are deficient. The first instinct of the bee is to provide for their young for the perpetuation of the race, and to secure this end they will get honey from any source, by fair means or foul. It must, however, be confessed that hunger is not always the cause of robbing, for sometimes the strongest and best provided for rob the most—indeed, there are those who pronounce the bee to be a bungler. But to the point. Don't meddle with bees now in the middle of the day, but what you must do, do it towards sunset. Be careful not to spill honey or syrup about the apiary, for that would doubtless lead to robbing at once. Where feeding is being carried on, take care that the bottles of syrup are well covered up, and that no bees can get to the food except those for which it is intended. Fill the bottles in the evening, and the food will be taken down in the night. If after all these precautions robbing is commenced, contract the entrances at once, so that only one bee can pass out at a time, and the guards inside will then be able to do their duty. In bad cases it has been sug-

gested that the hives of the robbers and the robbed should change places for a little while. The effect is singularly unique for the would be robbers are then stealing (?) from their own hive, and giving it to their weaker neighbours, for amongst bees the weakest ever go to the wall. There are other ways of preventing robbing, but the above are the principal methods adopted, and these and other things are they not written in the chronicles of the bee-keepers?

A nice little book comes to us from the pen of Mr. J. M. Hooker. It is not very large, but it is full of sound instruction gathered from experience, and written so that he who runs may read. The appliances and the dealers he mentions are at the top of the tree, and the book is thoroughly sound and useful. Though our evils are many this season, wasps have not as yet appeared here. This is not a circumstance to be regretted. *Bee.*

FIG. 38.—RHODODENDRON COLLETTIANUM: HARDY SHRUB, FLOWERS WHITE.

## NOTICES OF BOOKS.

### THE TREES OF COMMERCE. By W. Stevenson.

No. 2 of Messrs. William Rider & Son's *Timber Trade Handbooks*, may serve fairly well the purpose for which it is designed, that of "giving, within reasonable limits and in a popular form, an account of the trees that yield the staple of this trade." The scope of the work is limited, Mahogany, Teak, Greenheart, and fancy woods in general, being omitted, whilst a considerable space is devoted to the etymologies of names. The absence of an index, makes the contents appear more meagre than they really are, ten species of Oak, for instance, being included under "The Oak." The botanical portion of the work is professionally taken "almost exclusively" from Loudon's *Arboretum*, a work of compilation now out of date, and the preface acknowledges the author's indebtedness to Laslett's *Timber and Timber Trees*, in which the botany is lamentably incorrect: but, though the book is much smaller and makes but little pretence to completeness, it is rather difficult to see a distinct *raison d'être* for it, since the appearance of Mr. Laslett's work. The trade names are carefully given, and misprints, such as "C. Bankin" (p. 125) for C. Bauhin, are com-

mendably few. There are, however, some few statements to which exception may be taken, and some remarkable omissions. Bog Oak certainly shows the indigenous character of the tree; but there are certainly no fossil Oaks "in the limestone known as Portland stone" (p. 12)! The Dutch Elm (p. 35) is hardly a variety of *Ulmus campestris*, and it is to be regretted that the author has not distinguished between the characters of the timber of *U. campestris*, With.; and *U. suberosa*, Moench. The omission of all mention of the use of Elm wood for coffins is remarkable. Is any part of St. Leonard's Forest in Hampshire (p. 47), or does Fagus Dombeyi, really takes its name from "Dombey, near Concepcion" (p. 51)? The name "tulipwood" for the timber of *Liriodendron* may prove as misleading as the vague "whitewood" or the inexcusable "yellow Poplar;" and it is noteworthy that the Sycamore is called "Plane" in Scotland, as well as in America (p. 118). The total omission of so useful a wood for ornamental carving as that of the Spanish Chestnut; the wholesale condemnation of British-grown Scots Fir as "not of much value" (p. 161), in spite of the splendid specimens exhibited at the Edinburgh Forestry Exhibition; and the absence of any reference to the future of home-grown Abies Douglasii, strike one as mistakes, for the second of which our northern foresters are perhaps to blame, since the carelessly grown pit-props put upon the market have too often led to needless foreign importation. The bad effect of the general headings to the sections of the book, and the absence of an index are seen again in the difficulty of collecting the notes upon the "White Cedar" (*Cupressus thyoides*, L.) of the Eastern United States (pp. 217, 220, 221, 224), the wood of which is now of considerable importance to our brewers. Finally, one would like to know the histological evidence for the following astonishing remark on *Fraxinus americana* (p. 32):—

"The wood is undoubtedly inferior to that of European growth, and if, as contended by Darwinian students, it is merely a variety of an original stock akin to that of European growth, the inferiority can only be traced to its acquiring in some degree the habits of an aquatic plant, by which the fibrous system has gradually declined in favour of increase of cellular tissue until the change has become radical."

## RHODODENDRON COLLETTIANUM.\*

THIS (fig. 38) is a small-growing hardy shrub, in habit resembling *R. ferrugineum* and *hirsutum*. It was first described by Aitchison and Hemsley, having been collected by the former botanist in the Kuram Valley, Afghanistan, at heights of 10,000 to 13,000 feet. The plant in question flowered on the rocky at Kew during the last season. The leaves are coriaceous, oblong-lanceolate; the flowers are in clusters, white, rather less than 1 inch long; the tube of the corolla hairy inside. It is an interesting addition to the group of dwarf hardy *Rhododendrons*.

## TREES AND SHRUBS.

### THE WHITE BEAM TREE (PYRUS ARIA).

THIS extremely hardy tree is valuable for planting in many situations where others would fail. In hilly, wind-swept places it seems especially at home, for, however, exposed it may be, it retains its erect position, and the symmetry of its head. I have a specimen, now about 15 feet high, growing on the top of a bank, with a full exposure to the north and north-east. Several other trees which have been planted on the same site have gradually died out, but this continues to make progress—growing at the rate of about 18 inches a year—and is in a thoroughly healthy condition. Being deciduous, it of course forms but

\* *Rhododendron Collettianum*, Aitchison and Hemsley, in *Journal of the Linnean Society*, vol. xviii., 1881, p. 75; and vol. xix., t. 20.

an imperfect screen, or wind break, during the winter; but even at this time it is an interesting object, owing to the conspicuousness of its large green buds. From its leafing time until late in the autumn it never loses its effectiveness, as, irrespective of its flowers in the spring, and its fruit, which is now swelling out, the character of its foliage gives it a claim to a front rank amongst summer leafing trees. Where the darker shades of green so largely preponderate, as in the ordinary English landscape, a break of foliage of a lighter hue is always acceptable. If for no other reason than this, an occasional group of the White Beam is very useful. Even in perfectly still weather, when the face of its leaves is alone seen, the difference in colour is enough to at once attract attention, but when the tree is stirred by a slight rush of air, the appearance presented by the underside of its leaves, is in complete contrast to its ordinary surroundings. This mealy whiteness, it is true, is also possessed by the white Poplar and other trees of the genus, but is much more marked in the case of the White Beam, no doubt on account of the larger size of its leaves. There is another point, too, with regard to this tree which is worthy of note, viz., that it is only moderately dense in habit, and roots deeply, thus allowing grass and other things to grow beneath it. Many kinds of trees interfere seriously with hedges; indeed, so far in some cases as to kill them outright. This evil is much less in the case of the White Beam than with many species. It is, therefore, a suitable tree for planting near live fences, a thing which often has to be done, especially in the case of the narrow belts by roadsides and similar positions. Another recommendation for certain classes of planting is the fact that it only attains a moderate height. As a young tree it grows with a fair amount of rapidity, but after reaching the height of 18 or 20 feet makes very little further growth with respect to height, although it remains robust for a large number of years. Where used near the dwelling-house this is a valuable quality, and one too often lost sight of when planting in immediate proximity to the house is carried out. As its habit is naturally symmetrical, it is, as a rule, desirable to allow it to assume its own form, but when necessary it may be cut without hesitation, as it bears lopping well. Being so little grown, at any rate in the part of the country from which I write, its wood has not any recognised commercial value, but is hard and fine grained. *D. J. Y.*

#### FRAXINOMIA CALIFORNICA.

Near London we generally see this fine shrub trained to a wall, and it is not in all seasons that we are favoured with a sight of its golden blooms. At Colwyn Bay, North Wales, however, as we see from photograph obligingly communicated by Mr. A. O. Walker, it forms a spreading bush some 7 feet high, and as much or more through, and covered with bloom.

#### MAGNOLIA HYPOLEUCA.

This new Japanese species is figured in the number of the *Garden and Forest* for August 22. It is like *M. macrophylla*, and has creamy-white flowers, exhaling a delicious perfume. The tree is a native of the mountains of Southern Yesso, and its timber is used by the Japanese in the manufacture of objects to be lacquered. It was introduced to the United States in 1865 by Mr. Thomas Hogg, and has proved hardy.

#### THE WALNUT.

A short time ago I saw a couple of trees of the common Walnut sold for £30. There was a quantity of fine old Oak sold at the same time, but foot for foot this could have scarcely realised more than half the price. The sudden popularity of its foreign rivals has, no doubt, put our English grown Walnut into the shade, yet even now when compared with the figures obtainable for other common timbers, the position of the Walnut is not nearly so bad as would appear on the first blush. It is a tree of course which it would be doubtful policy to plant in large quantities, but a dozen or two upon a place would mean but little outlay, and they may be established in odd

nooks and corners, which would be of but small value for anything else. [Why not by the acre? The nuts fetch good prices, as well as the timber. Ed.] The instances I have quoted above may perhaps be a little out of the ordinary way, as there was considerable competition, but allowing for this, I very much doubt if there are any common woods, with perhaps the exception of the Ash and Sycamore, which would fetch better figures. A further recommendation of the Walnut is the fact that not unfrequently quite a small revenue is gained from its fruit. It was only the other day a very moderate-sized tree was pointed out to me, the fruit of which, sold as it grew last year, realised half-a-sovereign. This of itself is not a great sum, but when it is remembered that it represents the rent of an acre of land upon which the tree grew, it will be seen that it is no bad return. This was in the corner of a pasture field, and the occupier values the tree for its shade alone, and being within view of the house it is also an ornament. The two last named qualities many other trees would, of course, possess, but not a like value of its wood and fruit. *D. J. Y.*

## FORESTRY.

GROWTH OF CONIFERS AFTER BEING FELLED.—It occasionally happens, particularly on peaty soils, that stumps of the Larch and Silver Fir continue to produce annual layers of woody matter for several years after the trees have been felled; but it is not so well known that the Douglas Fir (*Pseudotsuga Douglasii*) is likewise capable of producing a similar growth. This I detected some time ago in a strip of mixed trees growing on loam incumbent on gravel, and where at least two of the stumps of the Douglas Fir, felled ten years before, had continued to produce annual layers of wood, the ten layers being distinctly visible with a low power of the microscope. What puzzles me most in this particular instance is how the roots retain their vitality in a sandy soil; had it been peat the wonder would have been less, as the antiseptic properties of that soil exert a peculiar influence in keeping the roots fresh and sound for a long time, and consequently encouraging the formation of such growths. Some persons attribute this peculiar formation of woody matter to the fact that trees which produce such had, previous to being felled, their roots engrafted on those of a neighbour, and consequently the production of annual layers of wood was hardly to be wondered at. Such an example I had, fortunately—for regarding this fact, I must own that I was somewhat sceptical—the chance of examining at the late Forestry Exhibition in Edinburgh; for there several exhibits, consisting of the roots of similar species of trees joined together or engrafted on each other, were to be seen.

But how about isolated trees? For Larches, Silver Firs, and Douglas Spruces that have come under my own notice, and which produced this abnormal growth, were growing at too great distances apart from other trees to suppose that their roots could have been joined or engrafted on these. That several trees have the power of forming an annual layer of woody matter in the manner just described is now beyond a doubt, and that even although the roots from the stump of the felled tree have no connection, whether by inarching or otherwise, with those of neighbouring living specimens. Some years ago I had occasion to have several Larches and other trees cut down just at the time when the sap was most abundant and in freest circulation; and five at least of these, after being lotted outside the woodland boundary, continued to form woody matter around the margin of the stem at the point where it had been severed from the stump, and went on doing so until the sap in the trunk was fully exhausted.

By way of experiment a friend and myself, in a plantation where a number of the Larch roots continued in a vigorous state after being deprived of

their tops, cut over several of the most likely trees, those growing in peaty soil principally at 6 inches from ground level. They were carefully felled with a sharp cross-cut saw, the saw-mark being seen as nearly horizontal with the ground level as possible, and every art used so as to prevent the bark being loosened around the collar of the stumps. Sections of nine of the trunks, 3 inches thick, were taken from the base of the butts, or immediately above the saw-cut, and each labelled similarly to that from which it was cut over in the ground. The butts in the ground were carefully guarded and marked; a label, clearly stating when the trunk had been felled, and a conspicuous figure corresponding with that on the section legibly printed on the corner of each. Out of the nine trees felled three continued to produce annual layers of wood, much to our joy and satisfaction, whilst one other was but half decided, growing partially from one of the sides, but it was of little use for the experiment in hand. Seven years after the trees were felled sections of the tree stumps which had continued to grow were carefully cut off, and on comparing these with their duplicates it was found that they had produced extra layers of woody deposit corresponding with the number of years since the trunk had been cut from the roots. The growth produced grows both upwards and inwards, the heart of the old stump gradually dying away as the young wood fills over and takes its place.

I have one example of a Larch root in which the new wood has attained to a height of fully 3½ inches from the level of the old stem, but when the original tree was cut I am unfortunately unable to say, but in judging from the deposits, some of which are hardly visible with the naked eye and required the aid of a lens to decipher, I should say twenty-three years. I have counted fully thirty of these annual growths in a Larch stump, and in one instance the new wood had almost completely enveloped or covered over the surface of the old stem.

The irregularity of growth of the wood, as also great differences in size of the annual deposits, is a matter that I have found to be most difficult to account for, at least in anything like a satisfactory way.

Sometimes the deposit of fresh wood on one side of the stem is nearly double that on the opposite; whilst again the woody matter tends high on one side, and rather inclines inwards towards the centre of the stump on the other. The wood produced in this peculiar way is hardly distinguishable from that formed naturally, and after a testing examination has been found to contain all the constituents of ordinary timber of the same kind.

Trees of very vigorous growth, growing in peaty soil, reclaimed peat log principally, and from sixteen to thirty years old, are most likely to produce the growth just referred to. Older trees rarely do so, but occasionally in sandy loam, as well as peat, this peculiar growth is detected.

Grigor, in his *Arboriculture*, says, that none of the Conifers spring from the roots when felled, but that stumps of the Silver Fir have been known, after the removal of the tree, to produce annual circles of woody matter, &c. Now in this—that none of the Conifers spring from the roots when felled—Grigor was in error, for *Sequoia sempervirens* and *Cunninghamia* *sensu* behave in this rather erratic manner, examples of which have come under my own notice, and I rather think that two others, belonging to quite distinct genera, may be linked with the *Sequoia* and *Cunninghamia*.

Propagation of the *Sequoia* is frequently effected by removing these shoots with a small portion of the stem, and planting in sandy soil, while we have frequently resorted to layering similar saplings of this tree as a means of increasing our stock. There is a curious example of this on Sir William Verner's estate in the North of Ireland, where the shoots sent out by a large Redwood, after being cut over at ground level, were layered around the stem, and the appearance now presented is as interesting as it is unusual. The soil was peaty, with a great quantity of decayed and decaying vegetable matter atop, and the stem of the tree cut over was about 3 feet in diameter.

In connection with the roots of coniferous trees becoming joined together or engrafted on each other, this may be a common enough occurrence; but what I would like to ask is, if any of your correspondents have known of an instance in which the roots of a coniferous tree had engrafted itself on that of a hardwood? *A. D. Webster, Holwood Park, Kent.*

## PLANTS AND THEIR CULTURE.

**SCUTELLARIAS.**—The best species for the gardener to grow is *Mocciniana*, a neat free-flowering plant, and an inmate of the intermediate house. It has compact heads of brilliant scarlet flowers, produced mostly at the seeds of the shoots. The inside of the lip of the corolla is deeply marked with yellow. The plant has an erect habit, and although very accommodating when grown and trained as a small shrub, yet it is perhaps of most service when grown as smaller plants in 5 or 6-inch pots.

Young plants should be raised periodically for this purpose; the young plants producing the finest heads of flower; moreover, by this method flowers may be obtained nearly all the year round. For flowering in winter and spring, cuttings should be put in now. There is usually no difficulty in getting them, especially, as in late summer they are freely produced on plants which have recently flowered. Select cuttings, which should be strong ones, and either dibble them into a mild propagating frame, or thickly into small pots, and plunge the latter in the frame, attention being afforded to shading, watering, &c. The cuttings should be rooted in about a fortnight, when they should be immediately potted off into rich, loamy soil which has plenty of sharp sand in it. As soon as they have taken to the new soil pinch the shoots back, and again after a few inches of fresh growth has been made; this will usually give from four to six leads, which will be sufficient for a plant in a 5-inch pot or small 32. At the last potting the compost should be very rich, and the plants potted firmly.

If larger specimens or speedier flowering are desired, then place several cuttings in a small pot at first, and simply pot on without pinching. In this way nicely-flowered pots may be had in a few weeks. In all stages of their growth keep them close up to the glass, and syringe freely until the flowers begin to show colour. The plants will last in flower for a considerable time if placed in a cool house.

**S. cordifolia** is a fine species with scarlet flowers; it succeeds under the like treatment, but it is not so amenable to times of flowering, and does best when allowed to flower naturally during the autumn months.

**Roses in Pots.**—The present is a good time to examine and repot when necessary, top-dress, or make good the defective drainage. Any little check which the plants may experience from any of these operations is much sooner got over than is the case when they are in a dormant state; moreover, Tea Roses, many of which, when grown in pots, are almost evergreen—if they receive fresh soil at this season in a short time many of them would be seen to be swelling their buds, which by the time that they are housed in the autumn, or in the case of plants now standing under glass will commence flowering without any forcing whatever. Plants coming into flower under these conditions have a great advantage over those brought on by means of heat, and lasting longer in flower. Roses of all sections are much better for being well established in their pots before being brought into a forcing house. Where the pots in which the Roses are growing are large enough, and the soil is in good condition, it is quite unnecessary to repot, but rather apply liquid manure during the season of growth. A good compost for use in potting is good loam of medium consistency—bone-dust, about a peck to 4 bushels of soil, and as much sharp sand as will keep the whole mass sweet and porous. If the loam be heavy it will be an advantage to add an eighth of leaf-mould or thoroughly decayed cow-manure. The Roses should either be accommodated under glass or in a sheltered position outside open to the sun. They should be freely syringed, and not left spared to keep the foliage in a healthy condition as if it should drop prematurely the buds would not get sufficiently mature to be able to produce flowers of the first quality when forced.

**Nigronette.**—No delay should occur before sowing the seeds to produce plants for the main winter and spring-flowering, for if it be deferred till a later period the plants have not so good a chance of getting established before the winter sets in, and are consequently more difficult to manage, especially if it be intended to keep them in cold frames, which, in the absence of better accommodation, is a good place to winter them, and better than mixing them with a miscellaneous collection of plants. With due attention to covering in cold weather, judicious airing, the frames having a rather sharp pitch, and

placed in a sheltered, sunny position, excellent results may be had. Sow the seeds rather thinly in well-drained 48 or 32-sized pots, filled to within about three-quarters of an inch of the rim with a compost of about three-parts loam and one part of well-decayed manure, sand, and leaf-soil, varying these in quantity according to the quality of the loam. Add a good sprinkling of gritty old lime mortar and soot to the heap; mix well, and fill the pots evenly and firmly, covering the seed lightly with some of the finer portion of the soil; plunge the pots in the frames, when, with attention to damping, and shading from bright sun, the seedlings will soon appear; they should be thinned out as soon afterwards as possible, leaving a few more plants than it is ultimately desired to retain, as these can be removed before crowding takes place, and if half-a-dozen good plants are eventually left these will fill the pots. As to the variety to be grown, individual taste differs, but the large-flowered white, red, and yellow varieties are all sufficiently distinct, and some of each should be grown.

**Balls for Forcing.**—The remainder of these should now be potted forthwith, and treated as recommended at p. 191. In addition to those mentioned there—*Hyacinths*, *Crocus*, and *Tulips* of all sorts, as well as *snowdrops*, *Scilla bifolia*, the scarlet *Windflower* (*Anemone fulgens*), *Iris*es of the early flowered kinds, such as *persica*, *reticulata*, and *stylota*, not forgetting plenty of white *Lilies*, both *candidum*, and *Harrisii*, for both of which 9 or 10-inch pots are convenient sizes, and give excellent results. *F. Ross*, *Blechningly*.

## THE FLOWER GARDEN.

**BEDDING PLANTS.**—Look over cuttings of bedding plants that were put in last month. Zonal *Pelargoniums* in pots and boxes standing in the open air require more than ordinary attention this season owing to their sappy growth. Replace with fresh ones all cuttings which have been lost. It will also be advisable to move the cuttings in pots and boxes to cold frames forthwith, giving due attention in regard to ventilation, and on bright days take the lights off entirely. Other cuttings, such as *Verbenas*, *Iresines*, *Coleas*, *Mesembryanthemums*, *Lobelias*, *Ageratums*, *Tropaeolums*, &c., must also receive timely attention. The majority of these, if put in and treated as previously advised, should now be well rooted, and should be afforded plenty of ventilation, the object to aim at being sturdy plants that will pass safely through the winter months. In a fortnight hence each and all of these subjects ought to be placed in the glasshouses, and from that time onwards must be carefully attended to as regards watering and ventilation. Old plants for stock purposes may be lifted and potted up in a compost of fibrous loam, leaf-mould, and sand. Use clean pots and ample drainage, place them in a heated pit or frame, shade and syringe overhead when necessary till the roots have taken hold of the fresh soil, and, with the exception of *Alternantheras*, cut the plants down to within a reasonable distance of the pots at the time of potting.

**Hardy Biennials.**—The majority of those that were raised from early-sown seed and pricked out afterwards may now be transplanted to where they are to flower; these should include *Antirrhinums*, *Sweet Williams*, *Brompton Stocks*, and *Campaula calycanthena* and its varieties. If the soil be fairly good, avoid putting any decayed manure into it, as this would tend to excite the plants into growth, and which, in the event of very severe weather, would probably be killed. In stiff clay land it will be found a good plan to add a little leaf-mould, burnt soil, or a few finely sifted cinder ashes to the staple. Where space can be afforded I would advise the growing of a good bed of *C. calycanthena*, for lifting and potting up just as they are coming into flower, when these will be found very useful for indoor decoration, and after being once grown they are sure to be inquired for again. When grown in beds or borders by themselves they should be given at the time of planting a distance of fully 18 inches or 2 feet each way. Wallflowers may also be transplanted where space can be afforded, or when beds in which they are to flower become vacant. In my case these plants are put into beds that have been occupied with summer-flowering subjects, and it rarely happens that I can do this work before the middle of October. *J. Horsfield, Heytesbury.*

## FRUITS UNDER GLASS.

**VINES.**—Late Grapes must now be pushed forward to have them thoroughly ripe by the end of September, else they will not keep well during the winter. Pinch out all lateral growths, and allow all the light possible to play amongst the fruit. If necessary, give a good watering, and mulch the border with some dry horse droppings to prevent the escape of moisture. Maintain a night temperature of 75°, with a chink of air to keep the moisture from settling on the bunches. Gros Colmar usually requires a long season to mature its fruit if at all heavily cropped. The greatest failing of this noble Grape is the premature shrivelling of the foliage. Under the circumstances it is as well to allow a moderate lateral growth to develop. No grape I know will stand so much fire-heat as this without shrivelling, and the more it gets the better the flavour. The earthy taste which is ascribed to this variety of Grape is scarcely discernible when wrought on the Hamburgh; I find I cannot colour it on the Barbarossa, although it is very free and swells enormous berries; yet the flavour is little inferior to those of the Hamburgh stock. I consider it should never be grown on its own roots. I remember some splendid samples growing in a Muscat house at Dramlanrig, where they were wrought on the Muscat if I mistake not.

Young Vines will require abundance of fire-heat and air in order to properly mature the wood of this season. In all my experience I never remember a more useless year than the present. Notwithstanding, Grapes have coloured well, and the berries are larger than the past dry years. Remove all lateral growths, and allow a free play of warm air and light to the wood. Now is a good time to attend to the lifting of Vine borders where the Grapes have been cut. If the borders are in a bad state the soil should be wholly removed, and the drainage attended to, and new soil substituted, the roots trimmed, and laid about 12 to 15 inches from the surface. Some sharp soil, largely composed of charred compost, sprinkled over them, and the remaining portion of the border made up. Pot Vines should now have perfected their growth and shed their foliage. These should be pruned as soon as they are fit, and stood in an airy position until the appearance of frost.

Where it is intended to make fresh borders during the coming winter the sooner the materials for their composition are got together the better, as wet weather is not suitable for collecting soils for this work; let the soil be placed in sharp ridges to run off wet. *Wm. M. Baillie Luton Hoo.*

## THE HARDY FRUIT GARDEN.

As soon as the Peach and Nectarine trees are cleared of fruit the bearing and useless wood should be cut away, so as to give that which is retained light and air to ripen it. The fruit tree borders should also be examined as to the state of the soil, more particularly when the walls have very wide copings, for although it has been a dripping season, the rain may not have reached the subsoil at the foot of the walls; and should it be found to be dry, thorough waterings must be repeatedly afforded until all is completely moistened.

**Jargonelle** and **Beurré Giffard** Pears are now ripening, and the forwardest may be gathered at intervals of a few days and placed in the fruit-room, where they will keep for a short period. Plums require looking over frequently, more especially when large quantities are grown and gathering the ripest. For bottling whole the fruit should be gathered before it is quite ripe, and the stalks should be left on the fruit. Late varieties, such as the *Red Magnum Bonum*, *Coe's Golden Drop*, *Jeffersons* and *Late Orleans*, are all very much improved in flavour by being allowed to hang until they begin to shrivel slightly, in fact Jefferson's is like a sweetmeat when it becomes a little shrivelled. If the trees are growing against walls the fruit must be protected from the attacks of wasps and flies. The present is a good time to make notes of the fruit trees wanted for planting during autumn and winter. A visit to a well appointed nursery at this season of the year will prove of immense advantage, for the newer varieties of fruit, as well as the proved ones, can be seen growing in quantities. *A. Ward, Stoke Edith Park.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

## APPOINTMENTS FOR THE ENSUING WEEK.

### SALES.

MONDAY,	SEPT. 17	Great Unreserved Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
		Annual Trade Sale of Greenhouse Plants at the Dyson's Lane Nursery, Upper Edmonton, by Protheroe & Morris.
TUESDAY,	SEPT. 18	First-class Dutch Bulbs, at Stevens' Rooms.
		First-class Dutch Bulbs, at 123, Fenchurch Street, by Messrs. Small & Co.
WEDNESDAY,	SEPT. 19	Annual Trade Sale of Greenhouse Plants at the Burnt Ash Lane Nurseries, Lee, by Protheroe & Morris.
		Annual Trade Sale of Greenhouse Plants at the Lea Bridge Road Nurseries, Leyton, E., by Messrs. Protheroe & Morris.
THURSDAY,	SEPT. 20	First-class Dutch Bulbs, at Stevens' Rooms.
		400 Plants of Azalea indica from Ghent, at Stevens' Rooms.
FRIDAY,	SEPT. 21	First-class Dutch Bulbs, at 123, Fenchurch Street, by Messrs. Small & Co.
		Annual Trade Sale of Greenhouse Plants, at the Brimsdown Nursery, Enfield Highway, by Messrs. Protheroe & Morris.
SATURDAY,	SEPT. 22	Established and Semi-established Orchids at Protheroe & Morris' Rooms.
		First-class Dutch Bulbs, at 123, Fenchurch Street, by Messrs. Small & Co.
		Great Unreserved Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
		First-class Dutch Bulbs, at Stevens' Rooms.

There can be little doubt that the British public—or, at least, those most immediately concerned—are being vigorously stirred up as to the necessity of utilising all our available resources. Of these, fruit culture is undoubtedly one. There is, however, a fear that, with the enthusiasm of advocates, exaggeration, and consequent disappointment, may prevail, if the subject be not treated with becoming carefulness. From this point of view the Fruit Conference at the Crystal Palace—the record of which occupies so much of our space to-day—may fairly be commended.

Mr. FRANCIS RIVERS, the worthy inheritor of a great name, with great prudence and discretion plunged at once into the more practical side of the question, and dealt with it in a spirit to which little but commendation can be applied. If any exception can be taken to his pronouncement it is, as we think, the undue value, under existing circumstances, that he placed on the chemical analysis of soil. In point of fact, the future of fruit cultivation, according to our present lights, is not so much a question of a little more or a little less potash in the soil, as of the selection of suitable sorts, and particularly of careful and judicious cultivation. Speaking generally, most soils are rich enough in potash not to need much expenditure in that direction, though, of course, it needs no chemist to tell the fruit-farmer that judicious feeding is as important for fruit trees as for any other crop. We have only to look at the majority of our fruit gardens to see that cultivation, in

the gardener's sense, has been and is grievously neglected by the fruit grower. The impression seems to prevail that we have only to stick in a fruit tree, and let it grow to secure desirable results. Look at the mangy condition of most of our orchards, the scrubby trees, the reckless pruning—save the mark!—the indifference as to the selection of suitable sorts and appropriate stocks, the utterly careless system of gathering, the reckless selection for market, and the happy-go-lucky system of packing and sending to market, and consider whether these things are not so inimical to profit as hard land laws, fiscal restrictions, and exorbitant railway charges. Growers for market have indeed much to learn from the gardeners who grow mainly for their masters' tables. Ask the salesmen in the market whose fruit fetches the highest prices, and the reasons; and it will be found that the gardeners by their superior skill in growing, in selecting, and in packing the produce, achieve results of a far more satisfactory character than the ordinary fruit grower though of course he has to deal with much larger quantities. The reasons for this are obvious enough. It is a question of good cultivation and business-like marketing; and the Conferences which have been held, and which are still to come, will effect much good by making this known. A knowledge of first principles will be diffused, and the experience of the most skilled cultivators will be turned to good account. In this way also will the labours of such men as KNIGHT and RIVERS the elder, and those who, like them, have combined science with practice and practice with science, be brought to bear on the subject. To experiment with knowledge, care, and judgment, as KNIGHT and RIVERS did, is to secure results of incalculable value. A Peach or a Plum which comes into use a week or two earlier, or a week or two later, as the case may be—which will be free from mildew while others are crippled with it, which will bear the rough handling consequent upon transit, which may be depended on for a crop of some sort, even in adverse seasons—to obtain and to distribute these is to add to the wealth of the producer, and to contribute to the welfare of the consumer. And the men who achieve these results—the men who know most of the subject—are precisely the men who, while recognising the desirability of extending fruit culture, will be, and are, the most ready to avoid exaggeration, and to look on fruit-culture as an adjunct to agriculture—not, as some seem to think, a substitute for it. It is, indeed, lamentable to see, on the one hand, the enormous importations from abroad, and on the other the equally great neglect of opportunities at home; and if these Conferences do aught, as we think they will, to reduce both to their proper proportions they will effect great good even if they do not realise all the "tall talk" which has been poured forth, or effect that change of climate which shall convert the British Isles into a second California.

Whether or no, the thanks of the community are due to Messrs. CASTLE and EARLEY, by whose exertions the recent Conference at the Palace was conducted to so satisfactory a conclusion, and which may lay the foundations of a Fruit Growers' Association on the lines of that famous American Pomological Society whose proceedings we have so often had to record with mixed feelings of congratulation to our American cousins and of humiliation as regards ourselves. A proposal to this effect was, indeed, submitted to the Conference by Mr. CHERR, and this is to be further discussed at the meeting to be held at the Crystal Palace on October 11.

**CONVOLVULUS TENUISSIMUS.**—A very beautiful greenhouse perennial, native of Greece (fig. 39). Its leaves are delicately cut into narrow lobes, and covered with silky pubescence. The flowers are of a pretty pink colour. It is figured in *SIN-THORP'S Flora Græca*, t. 195, and also in one of the early volumes of the *Botanical Magazine*, t. 359, where it was figured as *C. althoides*.

**THE BRITISH ASSOCIATION.**—The meeting at Bath may be described as one of average character Section D.—Biology—was presided over by Mr. DYER, Director of the Royal Gardens, Kew, who in his address reviewed the present state and prospects of botany and its applications to biology and medicine. We regret that the crowded state of our columns forbids our inserting any portion of this address this week, but we trust to be able to do so later on. Professor MARSHALL WARD's paper on the fungus destructive to Lilies was a very exhaustive piece of work, which will be probably published in full, when we may have an opportunity of referring to it.

**LANDSCAPE GARDENING IN INDIA.**—We understand that Mr. W. GOLDBRING has been engaged by His Highness the Maharajah GAERWAR of Baroda, to carry out some extensive landscape gardening work at Baroda and other parts of the GAERWAR's dominions. His Highness is desirous of having magnificent gardens around his palaces (Makurpura and Laxmivilasa), and no expense will be spared to effect his object. Mr. GOLDBRING is commissioned to design and lay out some public parks and gardens at Baroda and other places, and to advise His Highness upon organising a Department of Public Parks and Gardens, which will include a school for teaching the principles of horticulture to young native men. The GAERWAR is fond of gardening, and he is anxious to see gardening carried out on better principles in his dominions, for, having travelled much in Europe, he has seen how highly advanced gardening is here. Mr. GOLDBRING has been engaged to spend three winter months (December, January, and February) in India for three successive years, by which arrangement he will be able to continue his home practice, and he will start this year on his first visit in November.

**CHARLES LEIRENS.**—Visitors to the Ghent Quinquennial must be familiar, if not with the person at least with the name of this gentleman. He died on August 6 last at the age of 78 years, having for many years been a leading spirit in the Royal Society of Agriculture and of Botany of Ghent since 1838, in which position he obtained the confidence and respect of all with whom he came in contact.

**CHAMBRE SYNDICALE, GHENT.**—At the meeting of the Chambre, on August 13 last, Certificates were granted to the following subjects:—*Cypripedium Stomei* album, shown by MM. J. VERVAET & Co.; *Cattleya Randei*, shown by M. L. LINDEN; *Cypripedium C. Canham*, shown by M. J. HY-LEUXEN; *Filicium decipiens*, *Nephrolepis rufescens tripinnatifida*, and *Bertolonia Madame Ed. Pynaert*, shown by M. ED. PYNART; and *Cattleya Gaskelliana alba*, shown by M. ALFRED VAN INSCHOOT.

**"BOTANICAL MAGAZINE."**—The September number contains figures of—

*Spathoglottis Viellardi*, Rchb. f., t. 7013.—Leaves plicate; racemes from the base of the pseudobulb; flowers 2 inches across, star-shaped, flat, segments, ovate-lanceolate lip very narrow, anterior lobe rounded. New Caledonia.

*Caraguata Andraena*, E. Morren, t. 7014.—Leaves strap-shaped, spineless, reflexed; flowers in terminal stalked panicles, bracts orange, lanceolate, perianth segments yellow.

*Masdevallia Mooreana*, Rchb. f., t. 7015.—Flower-cup cylindric, tubular limb divided into linear-lanceolate acuminate segments of a rich crimson colour.

*Narcissus Brunneonectii*, Lagasce, t. 7016.—A very interesting species, with umbellate white flowers

FIG. 39.—*CONVOLVULUS TENUISSIMUS*: FOLIAGE SILVERY; FLOWERS PALE PINK. (SEE P. 300.)

like those of a Paper Narcissus, but almost destitute of crown. It is a native of Morocco, and flowered at Kew and with Sir E. G. LODGE, at Weedon.

*Erythronium Hendersoni*, S. Watson, t. 7017. — A species native of Oregon, with stalked oblong ovate leaves; solitary flowers reflexed on the tops of long peduncles; perianth segments reflexed, oblong, lanceolate, violet.

**L'ORCHIDIENNE.**—Under this name it is proposed to establish at Brussels a Society for the promotion of Orchid culture by means of meetings and lectures. Prof. REICHENBACH is honorary President for Germany, M. LINDEN for Brussels, and G. DE LANSBERG for Holland. The inaugural meeting will be held at 79, Rue Wiertz, Brussels, on September 23, at 10 a.m. The meetings will be held on the second Sunday in each month, and a special exhibition of Orchids once a year, at which amateurs alone will be allowed to compete. The annual subscription is 10 fr.

**THE ASCOT NURSERIES.**—The Royal Nurseries, Ascot, were put up for sale at the Auction Mart, London, by Messrs. PROTHEROE & MORRIS, on Friday, September 7, inst. These nurseries were originally founded by Mr. JOHN STANDISH, one of the most enterprising nurserymen of his time, and some of the evergreens and Conifers which adorn gardens at the present time were raised in them. After pointing out the advantages of purchasing a nursery, with the goodwill of the business as a going concern, the auctioneer invited biddings, which commenced at £2500; and, although there was a keen competition, the biddings did not reach the reserve price, the property being withdrawn at £4500.

**ASPARAGUS TENUISSIMUS.**—Mr. SMEE sends us a spray of this in flower; the flowers are small and greenish white. We do not remember to have seen it in bloom before.

**SKIPTON FLOWER SHOW.**—The annual show in connection with Skipton Floral and Horticultural Society was held on Saturday, September 1, in a field adjoining Skipton Castle. Sir MATHEW WILSON, Bart., opened the show in the early part of the afternoon, and expressed his regret at the meagre attendance, which he attributed to the inclement state of the elements, rain having fallen almost continuously throughout the morning. The exhibits were in advance of last year in quality.

**THE BATH SHOW.**—This show was of unusual excellence, as may be gathered from our report last week. The 1st prize for the most interesting exhibit of any hybrid or cross-fertilised plant (Orchids and Ferns excepted)—plants or cut specimens from which those results were obtained to be shown—was taken by Mr. CYPHER, of Cheltenham, who showed *Croton Newmanianus* × *Queen Victoria* and *Evansianus*. In a class for hybrid Ferns Colonel JONES took the 1st prize for a beautiful form of *Polystichum angulare*, named *P. a. inaequale variegatum*; and for six plants of hybrid varieties of *Athyrium* he was awarded a 1st prize. Col. JONES and Mr. LOWE secured, between them, no fewer than thirty First-class Certificates for distinct new varieties, a fact which shows that other bodies besides the Floral Committee award certificates in abundance.

**A NEW DEPARTURE.**—The eleventh show, promoted by the Habergham (near Burnley) Floral and Horticultural Society, was held on Saturday, September 1, at Gawthorpe Schools, near to Sir U. K. SHUTTLEWORTH's Lancashire seat, and proved a decided success in every way. This Society adopts a very commendable system. It is that the committee is commissioned previous to the show to visit and examine the gardens of intending exhibitors, and if it is found that any of them stage other than the committee have seen and marked, a disqualification is made.

**DOUBLE - FLOWERED PETUNIAS.**—Messrs. HENDER & SONS, of Mannamed Nursery, Plymouth, send blooms of double-fringed Petunias of their

strain. They are stated to be ordinary flowers from seedling plants, and are certainly very pretty flowers, well adapted for late summer use in the greenhouse. The firm has been experimenting with Petunias, with the object of raising good double forms, for over twenty years. The selection sent included the best hitherto raised of fringed, very double flowers in purple of various shades, white, and the two colours variously blended.

**TRINIDAD.**—The last *Bulletin* of the Botanical Department of Trinidad is occupied with a treatise on the cultivation of Coffee, based on a similar work by Mr. SABONADIERE, formerly of Ceylon, but now of Jamaica, and adapted to the requirements of Trinidad, by Mr. HART. A very important alteration in the procedure has of late taken place, whereby, after the pulp of the berry (cherry of commerce) has been removed, the seeds (beans) may be transmitted to England to have the parchment (endocarp) removed—a process that can be done with much less trouble and expense here than in the colonies, while, provided the "parchment" be kept perfectly dry, the Coffee travels better, and retains the desired colour better, than when the skin is removed on the plantations.

**FUNGUS FORAY.**—The concluding meeting of the season of the Yorkshire Naturalists' Union is to take the form of a fungus foray, on Wednesday the 26th inst. The hunting ground is to be Harewood Park and Woods, as well as other old woods, &c., within easy distance of Leeds. In the evening the specimens will be exhibited in Leeds Philosophical Hall. Mr. G. MASSE, F.R.M.S., of Kew, and others have accepted invitations to be present. The presence of mycologists will be most heartily welcomed, to whom circulars will be sent on application to the Secretary, Mr. W. D. ROEBUCK, Sunny Bank, Leeds.

**ARAUJA ALBENS.**—An exhibit which arrived on late for the inspection of the Floral Committee at their last meeting at Westminster, deserves notice. The charming group of flowers came from that home of beautiful things in the plant way—Pendell Court, Bletchingley. *Arauja albens* is, according to the *Genera Plantarum*, synonymous with *Physianthus albens*, and is a native of Buenos Ayres, belonging to the same natural order as Hoya, viz., Asclepiadaceae. It is a strong-growing and free-flowering greenhouse climber of nearly hardy nature, and grows well in any good rich soil. Mr. Ross' course of procedure is to trim or prune it in autumn after it has flowered. It is sweetly scented, and has the additional desirable qualification of lasting a long time in flower. It is a good plant to train under glass corridors, sunny verandahs, and such like positions.

**ORANGE CULTURE IN AMERICA.**—The question as to the cultivation of the Orange as a remunerative crop comes before us in a report on the fruit produce of Sicily, where it is stated that the cultivation of Oranges and Lemons in California, Louisiana, and Florida has assumed such vast proportions that it is a matter of certainty that at no distant period the import of the former of these fruits into America, which is one of the chief customers for this article, and the carrying business, which gives so large employment to English merchant vessels, will wholly cease, and, although the exportation, owing to a failure in the crops in Florida through an unprecedented frost, was largely increased in 1887, yet it was carried on at such prices as not to be remunerative. In fact, encouraged by the extraordinary prices which were obtained in the American markets for Sicilian produce some years ago, the Sicilian cultivators increased their Orange and Lemon plantations to such an extent that the over-production has increased to a ruinous degree. Indeed, the prices at which the fruit was sold in America in the past year did not, in some instances, even cover the freight. It must be added that their bad packing and the choice of inferior fruit which might have been used for the manufacture of essences and extracts at home, have not a little contributed to the depreciation of Sicilian fruit in foreign markets. The export of Lemons, however, may be continued on account of the especial aptitude of the Sicilian climate for the growth of these fruits owing to the absence of frost.

## PLANT PORTRAITS.

**ANTHURIUM DESMETIANUM** X. — A handsome cross-bred form, with hastate shining-green leaves, large cordate ovate-acute puckered spathes of a rich crimson-scarlet colour and short ivory spadices. It was raised by M. Desmet from A. Andreanum, fertilised with pollen from *Anthurium Leopold II.*, the last-named plant being itself a cross out of A. Lindenianum, fertilised by A. Andreanum. *Illustration Horticole*, t. 52.

**BATEMANIA COLLEYI**, Lindl., *Orchid Album*, t. 341.

**CATASETUM DREPIENS**, *Lindenia*, t. 144.

**CATLEYA LAWRENCEANA**, Rehb. f., *Orchid Album*, t. 342.

**CHEVALLIERIA GIGANTEA**, *Revue Horticole*, August 16.

**CYPRIPEDIUM CALIFORNICUM**, *Garden and Forest*, August 8.

**CYPRIPEDIUM CANNATTIANUM** X, figured in the *Lindenia*, t. 141, is a form of C. Roebelini, in which the two lower sepals are disjoined.

**CYPRIPEDIUM MITEADANUM**, *Lindenia*, t. 146.

**DENDROBIUM BENSONI**, *Lindenia*, t. 148.

**MASDEVALLIA HARRYANA DECORA**, *Orchid Album*, t. 344.

**MASDEVALLIA SPECTRUM**, Rehb. f., *Lindenia*, t. 143.

**NANODES MEDUSA**, *Lindenia*, t. 147.

**NARCISBUS TRIANDRUS** and **N. CYCLAMINUS**, *Garden*, August 25.

**ODONTOGLOSSUM HARRYANUM**, *Lindenia*, t. 142.

**ODONTOGLOSSUM LATIMACULATUM**, *Lindenia*, t. 145. — A variety of O. crispum.

**ODONTOGLOSSUM ROSSI AMESIANUM**, *Orchid Album*, t. 343.

**ONCIDIUM CAVENDISHIANUM**, *L'Orchidophile*, August, 1888.

**ONCIDIUM LIETZEI** VAR. **AURIFO-MACULATUM**, *Gartenflora*, t. 1279.

**ROODENDRON BRACHYCARPUM**, *Garden and Forest*, August 15.

**ROSE GLOIRE DE MARGOTTIN**, *Illust. Monatshefte*, August, 1888.

## HOME CORRESPONDENCE.

**NOTES ON SOME KINDS OF FRUIT.**—Never before in my rather long gardening experience do I remember to have seen Peaches and Nectarines so late in ripening as they are this season, for up to the present (September 6), we have not been able to gather a single dish or half a dozen fruit from the open walls except Early Rivers and Alexander, and such sorts as Belle Gode, Dr. Hogg, Fourre Hative Royal George, Grosse Mignonne and Noblesse are yet hard, and unless we get more sun and much warmer weather I doubt if many of them will be fit for the table at all. Nectarines, too, are in the same backward state, and the only kinds of these at all approaching ripeness are Lord Napier—which is a most valuable variety, and Elruge; Pine-apple, Pitmans Orange and Humboldt, looking as if they would take quite a month yet. Not only is the fruit in the backward state referred to but the wood of the trees, as may be expected, is green and soft; and unless a great change takes place between this and the fall of the leaf, the winter must have a very injurious effect on it, and even if it escapes severe frost the blossoms will be imperfect, and, as a natural consequence, the flowers will not set in the spring. These are gloomy prophecies, but the thing is too apparent to any one at all acquainted with Peach and Nectarine culture, as so much depends on the maturity of the young shoots in obtaining a crop, and this fact is now pretty well known. The fruit of Apples and Pears is now showing the bad effects of the season, as not only is it in both cases very small for the time of year, but much of it is pinched and deformed, and will be unfit for anything, and especially is this so with Pears, which are so injured in the skin that they are splitting and cracking, and instead of being fleshy, as they should be, are hard and woody, and it is useless leaving such on the trees. All this is very unfortunate, and must be a most serious matter with growers for market, who cannot, as they once could, look forward for better

prices, owing to scarcity of crop, as the foreigner comes in now and derives all the benefit. It is all very well to advocate a more extended cultivation of fruit, but what we really want is a better or more reliable climate, as of late years the springs have been disheartening, and yet there are sheltered spots, if rightly picked and chosen, where success in hardy fruit culture would be almost sure, and would give fine returns for the planting. These matters will, no doubt, be fully gone into at the Fruit Congresses, and I regret my inability to attend, after having the honour of my name being entered as one of the members, as I should have much liked to have taken part in such useful proceedings. J. S.

**DISEASE-RESISTING POTATOS.**—Whilst it may be dangerous to invite from readers districts as to kinds of Potatos which this season escaped in districts where otherwise the disease has been very destructive, yet it is obvious some reliable information on that head would be most useful as well as interesting. What one has to fear in relation to such returns is the desire to favour some kind which, after all, has resisting powers only in the writer's imagination. Still further, what is needed is evidence that any one kind has stood the disease thoroughly over a wide area. As to merely local examples, I have found some kinds good on one side of the road and bad on the other, so that merely individual examples are not enough. If there are any early or semi-early kinds which are not in one or two places but generally uninjured this season, their names cannot be too soon made known. So far as I can learn in this district, not one of that class has escaped, the earlier kinds especially being the worst hit of all our Potatos. In the case of late sorts there is much diversity, some being severely diseased whilst others are very little injured. Wherever stems are now still green, even if not a leaf is left upon them, it may be taken for granted the tubers are pretty sound. Probably no variety will be lifted this year absolutely free from disease; but when so many are relatively bad, whilst some few others are relatively good, the goodness if but relative deserves the fullest recognition. As is usually the case, the worst evidences of disease are found in the highly manured soils. Last year, because of the torrid dryness which prevailed, only such soils produced decent crops. This year the poorest, where also fairly well drained, have cleanest crops. On the whole the best plan is to plant in open ground which is deeply worked, to enable moisture to pass through freely, giving ample room for high earthing, and where the soil is partly rich and partly poor. Thus the contingencies of wet or dry seasons may be provided for as well as can be. So far as I can observe, the worst evidences of the disease are found in the tubers near the stems, down which and into the cavity in the soil made by them the heavy rains poured [a point in favour of Jansen-moulding, Ed.] However, as all varieties of Potatos similarly earthed had to endure the same floodings, it is evident that resistance to the attacks of the fungus must be in the tuber itself, and not in the plant growth. A. D.

**A FRUITFUL TREE.**—In the garden of Merton Lodge, Chiswick, there is a fine tree of Blenheim Orange Apple loaded with fruit. The tree is an old one, having been planted about fifty years ago, and has not failed to carry a good crop but once in the last nine years. This year it is estimated that the crop will be about 9 bushels. B.

**AN IVY COLUMN.**—One of the most striking objects I have seen for some time past is a tall Sruce tree encircled with Ivy to a height of 50 or 60 feet. The tree is one of a number growing on the boundary line of an old orchard in a deep valley. The Ivy completely covers the bole, with the exception of a few feet at the extreme head of the tree. At the base, commencing some 5 or 6 feet from the ground, the Ivy radiates from the stem in every direction to a distance of about 4 feet. This, with the thickness of the tree itself, gives a circle of about 10 feet diameter. This gradually tapers until at the height mentioned the top of the tree emerges and forms a small canopy to the column. I am not in a general way in favour of Ivy being allowed to gain such a hold as this, as it can only be a matter of time before the tree dies; but in an occasional instance like this tree, which is of no great value, may well be sacrificed to the effect of the Ivy. The use of the Lombardy Poplar as a columnar object in the landscape has long been recognised: in the case of which I am speaking the same result is gained, with the additional advantage of the column being

evergreen. Here, of course, the combination was accidental, but it could easily enough be produced elsewhere by encouraging the Ivy, and artificially arresting the growth of the tree selected. *D. J. Y.*

**LIFTING NARCISSUS BULBS.**—Under this head, on p. 263, Mr. Burbidge says he is puzzled by my suggestion that in *Daffodils*, "root-action remains active after the leaves are quite dead, and enables the bulb to get rid of its superfluous moisture into the soil." Mr. Burbidge fails to see how evaporation can take place through the bulb tunics when they are surrounded with wet soil. I am not learned in vegetable physiology, and I am afraid I cannot explain to him how this process takes place, but I never said or thought that it does. When the leaves are dead, I suppose that moisture, in different combinations, may be both taken in and given out by the roots. I believe that active changes may take place within a bulb when apparently at rest. We know that the roots may continue to feed it, and cause an increase of its substance, as, for instance, in Lilies and terrestrial Orchids, which may remain underground without any upward growth through whole seasons, and meanwhile double in size. During this time I suppose that excretions of superfluous matter, including water, may be given out from the roots. I read in Carpenter's *Vegetable Physiology* that "the roots themselves throw out a considerable amount of matter formed in the vegetable itself, and corresponding in character with its peculiar secretions." I can therefore see no unwarrantable assumptions in my theory that bulbs, when dug up, may rot from wet, which they might have got rid of if left in the ground. *C. Wolley Dod, Elidge Hall, Malpas.*

**HALE'S EARLY AND ALEXANDER PEACHES.**—In answer to Mr. Sheppard's enquiries as to whether Hale's Early and Alexander are the same, I wish to say that I am quite convinced they are quite distinct, and for this important reason, that Hale's on a south aspect was fully three weeks later than Alexander on a west wall, though in every other particular they certainly appear the same. I have read Mr. Divers' remarks upon this subject with interest, but think him in error when he says that Hale's or Alexander was raised by Mr. Rivers. I am under the impression they both are of American origin, though Alexander was sent out by Mr. Rivers. *G. Woodward.* [Mr. Divers said that Alexander was raised by Mr. Rivers, and that Hale's was of American origin, but sent out by Mr. Rivers, which is correct. *Ed.]*

**HARDY FRUIT TREES.**—Whilst Mr. Burbidge is suggesting that the American race of Apples may be improved in the direction of hardiness by the introduction as progenitors of Russian varieties, it may well be worth inquiring to what extent we have gained from the introduction of Apples from northern climes, and thus, reasoning from analogy, arrive at some just conclusion as to the nature of the results which may flow out of the practical adoption of Mr. Burbidge's suggestion. That writer refers to Red Astrachan and Duchess of Oldenburg as full-blooded Russian kinds. Such being the case, in what respect do these varieties show hardiness or other value beyond what is found in our natural or English varieties? Take, again, those Canadian forms—Northern Spy and Reinette Blanche, or Cobbett's Fall Pippin—are either of these harder or in any way more fruitful than are ordinary European varieties? The same question might well be asked of several others, and I think it will have to be generally admitted that, so far as can be evidenced, we have gained nothing in relation to our Apple strains by the introduction of high northern varieties. It is very doubtful whether they have been used here for crossing, probably because found generally to be of such indifferent value. In any case, it would be absurd to assume that, because these specified varieties are of northern origin, they are, or have been, found to be in southern latitudes harder or more productive than are our true British varieties. *A. D.*

**BASELLA RUBRA.**—The root of this plant, which is usually regarded as tender, will, I find, withstand a considerable amount of frost, provided it has been grown in a pot, and that the soil is dry at the approach of winter. A plant used as a window screen on the south aspect of a dwelling was in October of last year, after the growths were destroyed by the frost, placed in a shed. Here it passed the winter unharmed, and was in April shaken partly out of the soil and planted against a partially sunny wall. The growth was late in starting, owing to the untoward

nature of the weather about that time; but since then the plant has made rapid advance, and the main shoots have reached a height of 7 feet. The plant has a simple ovary, which afterwards becomes a membranous fruit, so that it is not florally beautiful, but its glossy heart-shaped leaves, which are of much substance, and the rapid growth of the shoots, make it a very desirable plant for covering a trellis, trailing round pillars and the sides of windows, and especially so in towns, where flowering subjects do not always succeed. I intend to leave the tuberous roots of the plant in the ground during the ensuing winter, under a protecting cover of coal-ashes. *B. rubra* is a variety of *B. cordifolia*, and yields a rich purple dye, but which is, however, difficult to fix. *M. W.*

**WICKER-WORK VASES AND FLOWER STANDS.**—Generally speaking it should be the aim of all who are responsible for the effective arrangement of flowers and plants in the house to utilise such receptacles as are the most conducive to that end. This, however, is not always the case, for too frequently we see gaudily painted vases, &c., which, as far as colour goes, are generally the reverse of effective, especially when no attention is paid to the colour of the flowers and leaves of the plants put into them. To produce a good and artistic effect in the arrangement of plants and flowers in the house special attention should be paid to this point. In my opinion we require more rustic work and less china and paint such as are now generally used. Some of the terra-cotta vases are exceptionally good for indoor decoration; yet how seldom do we see them used when compared with China and other kinds of pottery? Again, there are numerous other sorts of vases for holding plants and flowers, which in my opinion are preferable to those commonly in use. When in Lincolnshire recently I was surprised to see the numerous and varied designs of flower receptacles made in wicker-work. The majority of these are not toys, such as many may suppose, but strong and serviceable, and not only that, but very artistic. In various districts in the Fens, where the Willow abounds, this is a special industry, and one which employs many hundreds of hands in cutting, tying, boiling and otherwise preparing the rods before they are sent to the factory, where the vases, stands, &c., are made. Many I noticed, while recently looking over the extensive works of Mr. Harris, Grantham, were made in the exact shape of a flower-pot in various sizes, some on stands varying from 2 to 3 feet in height, and others for standing on a table or sideboard. Into these an ordinary pot may be stood without any further trouble. Again I noticed numerous useful little receptacles for hanging on the walls of a room, passage, or hall. These may be utilised for small flowering plants, Ferns, or cut flowers, and when tastefully arranged would produce a charming effect. In fact, many are the uses to which these wicker-work flower-stands may be put. *C. Collins.*

**THE POTATO DISEASE.**—I need hardly apologise for referring to this important subject again, for in the minds of all associated with the soil it is the dominant one. Already do I hear from many sources of the disease proving to be exceptionally bad on the tubers, indeed the proportion of diseased ones seems to range from 30 to 60 per cent. according to soil and general conditions. In stiff soils and especially where there has been strong growth owing to liberal manuring, the disease is terribly virulent, the crops being hardly worth lifting. Facts accumulate with rapidity and so does the disease progress, so that what seemed uncertain one week is made a terrible fact the next. My own observations, so far, have conclusively shown that the disease spores have entered the tubers from the outside and not through the stems; the worst affected being those near the surface, especially large ones, and those tubers which were during the heavy rains near the stems saturated, as down the cavity in the side made by these the water must have poured in, and the newly-formed tubers with constant freedom. We shall find all sorts, which have any reputation for disease-resisting powers very fully tested, and any which have proved successful will merit all praise. Why any tubers should thus resist the action of the fungus spores is hard to understand, now that we know the disease is propagated in the tuber rube: than through the stems of the plants, except on the hypothesis that the skin or epidermis of the tubers is stouter or less penetrable. However, there will be time enough to deal with that subject when it is proved that some kinds really have resisted the fungus this year. The dryer weather may prove

some sort of saving grace to the later kinds should it continue, but it is certain that whatever may be the merits of tubers, no kind of foliage enjoys immunity from the attacks of the disease. *A. D.*

— "Whosoever will help to ruin his neighbours' crops, willingly, wittingly, per spore of *Peronospora*, let him be anathematised!"—nay, what is more effective and altogether better for a so-called "practical people," let him be hauled before a court of summary jurisdiction and mulcted in the amount of the damage done. Such thoughts as these must occur to all who read Mr. W. G. Smith's communication in a recent number, following up what had been said in the leader of the previous week. His words make one stand aghast, and wonder where is the use of experience, of experiment, of the ubiquitous Press. To repeat a few lines of Mr. Smith's paragraph may here again be useful:—"Some of the Potatoes were lifted here last week, and I now observe the fungus-infested haulms (some still green) neatly laid in heaps at the plot corners, the white fungus itself being quite visible to the unaided eye: other blight-stricken haulms are on the paths, to be trodden in—still others are laid one on another upon heaps of stable manure, ready for digging into the ground. The fungus is not at its worst yet; it is only just commencing operations, but I do not remember seeing it in a more general or threatening condition." In how many places may not this be used ink-photographically? And yet, year after year, your pages at this season of the year—those of your contemporaries and agricultural brethren, together with the general Press, have teemed, not only with such illustrations, but with the very simple instructions as to the checking of this selishly propagated plague! From some—from thousands of gardens there flows nothing but beauty—beauty in crops, in example, and in precept; from others come the worst of everything. We complain of being handicapped by land laws, by railway companies and other things—forgetting that too often we grow the worst instead of the best—that too often weeds—pretty as they may look—choke our crops; and that year after year selfishness and ignorance—they are not always synonymous—are allowed by a paternal government to poison the air and the land, and the very crops themselves with Potato poison. Shame indeed to this so much governed nation. We cannot see the pest until it forces itself into notice—the mental eye in this case waits on the imagination; differently, however, from the instance where it is said—

"Ah, could my Sweet but ope her inner eye  
And see how love hath girt her round with flowers."

The man who by his carelessness and indifference propagates the fungus, as you have pointed out, is most assuredly as much a thief as any one in London streets who filches purses and watches, or who climbs into one's house during the night and steals the silver. There is a difference, truly, but it is only in manner, not in effect. Disease in cattle exercises the Home Department of Her Majesty's Government very considerably upon occasions; and every possible means is taken to stamp out that disease; why should not the same be done, as far as circumstances will permit, in the case of the Potato disease? But—ah, that "but"—we require an Act of Parliament, a Ministry of Rural Economy—a whole pile of machinery set in motion to secure sound, even if little, Potatoes! But this must eventually be done—and in the end will prove a cheap and efficacious remedy. Only those who deserve should be made to suffer. In some of our colonies, I believe, it is illegal to propagate weeds of particular kinds, and punishable by fine, &c.; what has been found of value there should certainly prove efficacious in similar cases here. This matter I recommend to the careful consideration of the two great societies so deeply interested in it, the Royal Horticultural and the Royal Agricultural Societies. A simple Bill might be drawn up between them, giving powers to the Local Government Boards as well as to the head Department; all parties surely would assist to pass it rapidly through "both our Houses." *C.*

## CROCOSMA AUREA.

I enclose a photograph of a plant I have called the golden Crocus of the universe, *Crococoma aurea*, that was grown out-of-doors in the bulb bed in Hyde Park, Sydney. Nearly five years ago we imported six corns from London, four of which survived the carriage. The plant when in flower measured exactly 4 feet in diameter, and a little over 3 feet in height, and had 300 flower-spikes, which have upwards of 5000 flowers. It can be more easily imagined than described the wonderful effect this plant made with its bright orange coloured flowers. The plant is growing in a rather loose sandy soil, and the position is one fully exposed to our sub-tropical sun. The way I have managed to keep the stems close together is, that during the spring months, when the plant is growing, to put the spade down as deep as it will go, about 1 foot outside the previous season's growth. This is done two or three times at intervals of three weeks or a month, which has the desired effect in preventing the stolons getting away. I thought a photograph and description of this plant would be interesting to your readers, from the fact of its being always considered a rather shy flowerer at home, and an erratic one at that, as its long underground stolons render it not very easy to be kept within bounds. *Fred. Turner, Superintendent, Hyde Park, Sydney.* [The engravings (figs. 40 and 41), which were taken from the photographs, amply bear out our correspondent's remarks. Ed.]

## SOCIETIES.

## ROYAL HORTICULTURAL.

THE Floral and Fruit Committees met at the Drill Hall, James Street, Westminster, on Tuesday, September 11. The bulk of the exhibits consisted of plants, cut flowers, and fruits sent by nurserymen and amateurs taking up but a small amount of space. Hardy herbaceous flowers from Mr. Ware's nursery, *Gladiolus* from that of Messrs. Kelway & Sons, Lilies from Mr. Gordon, Twickenham; and a collection of Asters from the Society's garden, together with fruits from Messrs. J. Veitch & Sons' nursery at Fulham, were the chief.

## Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. Rev. W. Wilks, J. Walker, W. Goldring, W. Bates, Low, R. Dean, T. Baines, C. Pilcher, J. Dominy, H. M. Pollett, J. O'Brien, E. Hill, S. Hibberd, W. Holmes, J. Fraser, and G. Nicholson.

A few Orchids were exhibited by Mr. B. S. Williams, and included *Oncidium ornithorhynchum album*, showing a single spray, 1½ foot long, of minute white flowers having a yellow crest, and the perfume of Patchouli; *Catasetum tabulare* (læve), a whitish-green flower, singular looking, but wanting in decorative value; *Lælia monophylla*, orange-scarlet in colour; no opinion could be formed of the character or beauty of the plant, one flower only being shown. It was awarded a Botanical Certificate. A well-flowered plant of *Miltonia candida*—the tube is pure white exteriorly, but marked on the inside with mauve; the sepals are brown, edged and barred with yellow. *Mesopispidium vulcanicum* (superbum), a plant having two fine spikes of its deep rose-coloured flowers.

F. G. Tautz, Esq., Studley House, Shepherd's Bush, exhibited *Oncidium macranthum* var. *Williamsii*, a well bloomed specimen; *Disa graminifolia*, from the same exhibitor, was awarded a Botanical Certificate.

The fine Cattleya Eldorado, flower white all but the throat, which is yellow, was shown by W. Soper, Esq., 337, Clapham Road, S.W. Two plants of *Lælia elegans* came from Mr. Cook, Kingston Hill.

*Miscellaneous.*—A neat growing *Adiantum*, said to be obtained by crossing *A. cuneatum* and *A. Pacotii*, and certainly possessing the characteristics of both, was shown by Mr. R. Allum, nurseries, Tamworth, Staffordshire.

Several forms of cut blooms of *Lilium auratum*, *L. tigrinum* flore-pleno, from plants growing in the open, were shown by G. F. Wilson, Esq., Weybridge; *Carnation Blushing Bride*, a light pink, of nice form and picots at the margin, came from Mr. T. Butcher, Croydon; a sport from *Wermig's Yellow* was shown by Messrs. Hawkins & Bennett, Twickenham; it is showy bright yellow, with broad reflexed florets.

A basketful of blooms of *Hydrangea paniculata grandiflora* came from the Society's garden. This variety shows a larger spike than the ordinary form of *paniculata*.

Mr. F. Ross, gr., Pendell Court, showed the old stove creeper *Arauja albens*, in full flower. (See our last issue (p. 271) for a full description of this handsome plant.)

A showy hybrid of *Dianthus Heddewegii* crossed with *D. barbatus* (Sweet William) was shown by Mr. R. Dean, Ealing. In colour it is intermediate between the two parents, and is taller than *D. Heddewegii* and rather more spreading, as well as having smaller flowers. It should make a showy bedder. *D. H. Snowdrift*, a pure white form; *Phlox decussata* Rosamond, *Chrysanthemum maximum*, growing 3 feet high, &c., were also shown by Mr. Dean.

Messrs. H. Low & Co., Clapton, showed *Lilium nepalense*, a flower having black-brown segments, abundantly tipped with green colour.

A few single Dahlias were shown, but nothing which calls for any remarks from us. The Mikado, a crimson-petalled bloom, the disc and base and tips

FIG. 40.—CROCOSMA AUREA.

of the petals a yellow colour, was shown by T. W. Girdlestone, Esq.

The *Gladiolus* from Messrs. Kelway & Son made a rich display; the flowers individually also were fine and well assorted. *Besler*, a carmine flamed with scarlet at the edge, and *Castro*, a bright crimson colour, flaked with white, met the approbation of the committee. A Silver Banksian Medal.

A variety of pot Carnations, *Bouvardia Excelsior*, pink; *B. President* Cleveland, deep crimson; and some very stocky *Mignonette* in small 48's, were exhibited by Mr. H. B. May, of Dyson's Lane, Edmonton. A great bank of *Crotons*, in such variety, of market size, came from the same exhibitor; the brightest was *Etna*, and all were compact and vigorous, though showing less colour than is their wont.

From Mr. Hardy, Orton Hall, Peterborough, came fruits of *Torreya myristica*, egg-shaped, 1½ inch in their longer, and 1 inch in their shorter diameter; colour green, marked with alternate longitudinal stripes of light and dark. A cone of *Abies magnifica* was also sent by Mr. Hardy.

A large number of *Liliums*, mostly *L. auratum*, but likewise including *L. Kratzeri*, *L. longifolium album*, *L. roseum*, and *L. l. rubrum*, and others were shown by Mr. W. Gordon, Twickenham. Bronze Banksian Medal.

The Society's garden contributed a numerous array of German Asters of all sections which have been on trial there this season. It was an interesting group, but, like most out-of-door flowers this season, the flowers showed damage from rain and deficient sunshine.

Mr. T. S. Ware, Tottenham, had a showy display of hardy cut flowers, consisting chiefly of Lilies, *Gladiolus Lemoinei*, *Tigridia*, *Alstromerias*, *Cactus Dahlia* Professor Baldwin, a scarlet coloured flower; *Papaver orientale* and *P. nudicaule*, and *Trollius europæus*, *Eremurus Olgae*, a fine variety of *E. spectabilis* and *Romneya Coulteri*, a *Papaver*, with large and beautiful white flowers; *Crococoma aurea* was likewise observed. A Silver Banksian Medal was awarded.

A single flower of *Crococoma aurea* was shown by Mr. J. O'Brien, West Street, Harrow-on-the-Hill. It has orange coloured petals, having a crimson bar about the middle of their length.

## FIRST-CLASS CERTIFICATES.

Carnation Madame Carle, from Mr. B. H. May. *Chrysanthemum* Mrs. H. Hawkins, from Messrs. Hawkins & Bennett.

*Dahlia* The Mikado, from Mr. T. W. Girdlestone. *Dianthus splendens*, from Mr. R. Dean. *Eremurus Olgae*, from Mr. T. S. Ware. *Gladiolus Besler*, from Messrs. Kelway & Sons. *Gladiolus Castro*, from Messrs. Kelway & Sons. *Lilium nepalense*, from Messrs. H. Low & Co. *Oncidium ornithorhynchum*, from Mr. B. S. Williams.

*Romneya Coulteri*, from Mr. T. S. Ware.

## BOTANICAL CERTIFICATES.

*Disa graminifolia*, from Mr. F. G. Tautz. *Lælia monophylla*, from Mr. B. S. Williams.

## Fruit Committee.

Present: Messrs. R. D. Blackmore, A. H. Pearson, P. Crowley, J. Cheal, J. Burnett, J. Willard, W. Warren, W. Marshall, G. T. Miles, J. Wright, and P. Barr.

From Messrs. J. Veitch & Sons' nurseries there were collections of Plums, Apples, and Pears, and a dish of fine Morello Cherries. The Apples were noteworthy for size and the clearness of the skin. Another exhibit was a number of very young cordon Plums in full bearing.

The Blackman Ventilating Co., 63, Fore Street, E.C., sent dried Strawberries, Gooseberries, Rhubarb, and Potatoes, whole as regards the first two fruits, the others being sliced, or cut into short lengths. These were shown under various heats, and appeared to be quite dried for long keeping, but how they would stand the crucial test of cooking was not ascertainable.

A few fine fruits of Apples and Pears which were set with just enough glass protection as would save them from injury by frost, were sent by Rev. W. Wilks, Shirley; the trees from which the fruit was picked were growing in 10—12-inch pots, and are bearing abundantly, yet the fruits were in many cases above the average in size. A constant bearing Apple, The Vicar, said to do well in poor soils, and with a sturdy growth, came from Mr. Wilks. A Cultural Commendation was awarded.

W. Rouppell, Esq., Harvey Lodge, S.W., showed various Apples from bushes on the Paradise stock, all being fine of their kind.

A few Melons, Pigs, and Pears completed the exhibits.

## CRYSTAL PALACE.

## NATIONAL DAHLIA SHOW.

FRIDAY AND SATURDAY, September 7 and 8.—This proved in all respect much better than was expected. The very fact that the season is so late led some to think that the flowers would scarcely be ready in time; and Mr. Harry Turner states that his collection at Slough will be at its best in a fortnight's time, should the weather prove fine and open. But there was a good competition in all the classes, though a general lack of brightness was noted in the Dahlias. The forty-eight blooms shown by Mr. G. Turner in class 2 were very fine throughout, and indeed all the strength of the Slough collection was put into this class. The fancy varieties were a little rough. Pompon, single and decorative (Cactus) Dahlias very fine, and seedlings unusually numerous, some delightful new varieties of the pompon section being produced. A large number of exhibitors took part in the competition.

*Nurserymen's Classes.*—In the class for seventy-two blooms, not fewer than thirty-six varieties, there were four competitors for the four prizes, and here Messrs. Keynes, Williams & Co., nurserymen, were 1st, with a good lot of blooms, the season considered, consisting of Joseph Ashby, Royal Queen, Harry Keith, Colonelist, Mrs. Langtry, W. Spofforth, Thomas Hobbs, Nellie Cramond, Henry Walton, Mrs. Gladstone, James Service, Burgundy, Battercup, Richard Dean, Eclipse, James Vick, Clara, Thomas Goodwin, Diadem, King of Crimson, Herbert Turner, Willie Garratt, George Barnes, Lustrous, Mr. Dodds, J. T. West, James Cocker, Mr. Glasscock, Gloire de Lyon, Mrs. Kendal, Henry Walton, Hon. Mrs. P. Wyndham, Mrs. G. F. Jeffard, Prince Bismarck, and the following fancy varieties:—Frank Pearce, Madame Soubeire, Hugh Austin, Rebecca, W. G. Heade, Duchess of Albany, Rev. J. B. M. Camm, and Henry Eckford. 2nd, Mr. Charles Turner, Royal Nursery, Slough, with Henry Walton, Mrs. Kendal, Mrs. Gladstone, Champion Rollo, J. T. West, Mrs. Shirley Hibberd, R. T. Rawlings, John Bennett, Crimson King, Joseph Ashby, Charles Lidgard, Mrs. W. Head, Mr. Harris, Mrs. W. Slack, Harry Keith, James Cocker, George Dickson, Lady Gladys Herbert, Mrs. Kendal, Goldfinder, Mrs. Jeffard, Prim-

varieties, showing a very good lot of blooms of such fine varieties as Mrs. Gladstone, Thomas Hobbs, Royal Queen, James Cocker, John Wyatt, Hope, J. N. Keynes, Ethel Britton, Rebecca, R. T. Rawlings, Lady Ravensworth, Queen of the Belgians, Mrs. Langtry, Harry Keith, Grand Sultan, Joseph Ashby, William Rawlings, Flag of Truce, Burgundy, Royalty, Mrs. W. Slack, Peacock (fancy), Mrs. G. R. Jeffard, James Cocker, Hon. Mrs. P. Wyndham, Colonelist, Mrs. Gladstone, Lady Louisa Mills, Mr. Harris, John Bennett, Mrs. S. Hibberd, Joseph Green, Flora Wyatt, and Earl of Ravensworth. 2nd, Messrs. J. Saltmarsh & Son, nurserymen, Chelmsford, with Henry Walton, Harry Keith, Constance, James Vick, John Standish, Mrs. Langtry, Mrs. Gladstone, James Cocker, Lady G. Herbert, J. T. West, Mrs. Saunders, Willie Garratt, Ethel Britton, Mrs. Harris, Sunbeam, Mrs. George Rawlings, Goldfinder, Gaiety, Criterion, and William Rawlings.

In the class for twenty-four blooms there were seven entries, and Messrs. J. Saltmarsh & Son were 1st with finished flowers of Henry Walton, R. T. Rawlings, Willie Garratt, Mrs. Gladstone, Mrs. Saunders (fancy), William Rawlings, Mrs. Langtry, Burgundy, J. T. West, Shirley Hibberd, Mrs. Harris, Hugh Austin, Mr. Glasscock, Constance, Harry

Ethel Britton, T. S. Ware, a very fine crimson self; Mrs. Harris, Thomas Hobbs, Prince of Denmark, Mrs. G. Rawlings, John Henshaw, Mrs. Shirley Hibberd, Colonelist, Queen of the Belgians, Mr. Glasscock, J. T. West, Miss Cannell, Prince Bismarck, R. T. Rawlings, Burgundy, Mrs. W. Slack, W. H. Williams, Royalty, and Walter. It is worthy of note that this stand, which contained some very highly finished blooms, included also ten varieties raised by Messrs. Bros. 2nd, Mr. W. Mist, Igham, Sevenoaks, with some good blooms of Harry Keith, Harrison Weir, W. H. Williams, Queen of Primroses, Wm. Rawlings, The Ameer, Queen of the Belgians, Mrs. Langtry, Grand National, a yellow self; Mrs. Gladstone, Clara, Lady G. Herbert, and Mrs. Shirley Hibberd.

In the class for twelve varieties there were nine stands, and Mr. J. T. West, gr. to H. Keith, Esq., Cornwallis, Brentwood, was 1st, with a stand of good blooms, having Harry Keith, R. T. Rawlings, Mr. Glasscock, Mrs. Gladstone, Mr. Geo. Harris, F. J. Saltmarsh, Prince Bismarck, Miss Cannell, Prince of Denmark, Mrs. S. Hibberd, Wm. Rawlings, and J. T. West. 2nd, Mr. Thomas Hobbs, Lower Easton, Bistol, with Clara, Queen of the Belgians, Henry Walton, Ethel Britton, Golden Eagle, Emily Edwards, Shirley Hibberd, J. N. Keynes, Mrs. Dodds, Hon. Mrs. P. Wyndham, Hon. S. Herbert, and Mrs. Jeffard.

In the class for six blooms there were nine stands, Mr. H. Steer, Southwood, New Eltham, being 1st, with George Dickson, Ethel Britton, Golden Eagle, Joseph Ashby, Miss Cannell, and J. N. Keynes. 2nd, Mr. W. H. Smith, Wanborough, Shrivensham.

*Fancy Dahlias.*—In the class for twelve blooms there were three competitors, Mr. J. T. West being placed 1st, with good examples of Mr. N. Hall, Rev. J. B. M. Camm, W. G. Grace, Duchess of Albany John Forbes, Hugh Austin, Dorothy, Frank Pearce, Salamander, James O'Brien, Mrs. Saunders, and Henry Glasscock; 2nd, Mr. H. Glasscock, with Duchess of Albany, Egyptian Prince, Chorister, Mrs. Saunders, Miss Browning, Goldfinch, Mr. N. Halls, etc.; 3rd, Mr. W. Mist.

In the class for six blooms there were ten entries, Mr. Sidney Cooper, Chippenham, being 1st with Peacock, Henry Eckford, Prince Henry, Lottie Eckford, Goldfinch, and Egyptian Prince; 2nd, Mr. Thos. Hobbs, his best blooms being Fanny Start, Henry Eckford, and W. G. Head.

*Open Classes.*—Next came four classes for six blooms of stated colours; and in that for dark varieties there were eight competitors, Mr. J. T. West being 1st with James Vick, Rev. J. Godday, Prince of Denmark, Lord Chelmsford, Shirley Hibberd, and Harry Turner; 2nd, Mrs. M. V. Seale, with Shirley Hibberd, Hon. S. Herbert, Prince of Denmark, William Rawlings, Prince Bismarck, and David Saunders.

In that for six light Dahlias Mr. C. Turner was 1st with Mrs. Gladstone, Julia Wyatt, Mrs. Harris, Ethel Britton, Flag of Truce, and Mary Anderson, a seedling in the way of Mrs. Gladstone; 2nd, Messrs. J. Saltmarsh & Son, with Mrs. George Rawlings, Mrs. G. Harris, Earl of Ravensworth, Flag of Truce, Mrs. Gladstone, and Ethel Britton.

Messrs. Keynes Williams & Co. had the best six tipped Dahlias in Mrs. Kendal, Peacock, Henry Walton, Fanny Start, Miss Cannell, and Mrs. Saunders; 2nd, Messrs. J. Saltmarsh & Son, with Mrs. Langtry, Polly Sandell, Lady Gladys Herbert, Mrs. Saunders, Mrs. N. Halls, and Peacock, fancies playing an important part in this class.

Messrs. Keynes & Co. had the best six striped Dahlias, having the following fancy varieties:—Prince Henry, James O'Brien, Hercules, Hugh Austin, Rebecca, and the Rev. J. B. M. Camm; 2nd, Messrs. H. Clark & Son, nurserymen, Rodley, Leeds, with Henry Eckford, Rev. J. B. M. Camm, Lottie Eckford, Rebecca, General Gordon and Hugh Austin.

*Decorative and Cactus Dahlias.*—There were two classes for these—one (open) for six varieties, six blooms of each; and the other for amateurs, four varieties, three blooms of each. As might be expected they made an imposing effect. There were six stands of six bunches, Mr. C. Turner being 1st, with fine examples of Empress of India, Mrs. Hawkins, Lady Marsham, Henry Patrick, White Juarez, and William Rayner. 2nd, Messrs. Williams & Co., with fine bunches, also including some very promising new varieties—Amphion, Empress of India, Mrs. Hawkins, Juarez, Honoria, and Panthea.

In the amateur class Mr. Henry Glasscock was 1st with Mrs. Hawkins, Empress of India, Juarez, and Henry Patrick. 2nd, M. Heeremans, with Charming

FIG. 41.—CROCOSMIA ACUREA. (SEE P. 304.)

rose Dame, Florence, and Walter. 3rd, Mrs. M. V. Seale, The Nurseries, Sevenoaks; 4th, Mr. Eric F. Such, florist, Maidenhead.

In the class for forty-eight blooms, distinct, Mr. C. Turner was 1st, with remarkably good blooms of the following:—Mrs. J. Downie, Burgundy, T. J. Saltmarsh, Henry Walton, Diadem, Prince Bismarck, Goldfinder, The Ameer, Crimson King, Mrs. Douglas, James Cocker, Rebecca (fancy), James Cocker, Mrs. G. R. Jeffard, Ethel Britton, Mrs. W. Slack, Olivia, Walter, Mrs. S. Hibberd, Primrose Dame, Joseph Green, Mr. Harris, Mrs. Kendal, W. Rawlings, Champion Rollo, Hon. Mrs. P. Wyndham, Harry Keith, Georgiana, James Vick, Mrs. Gladstone, Willie Garratt, Mrs. Foster, Imperial, Prince Bismarck, Chris. Ridley, Royalty, Charles Wyatt, R. T. Rawlings, J. T. West, Clara, Mrs. Harris, Lady G. Herbert, Flag of Truce, and Excellent; 2nd, Messrs. Keynes, Williams & Co., their best flowers being Harry Keith, Rev. J. B. M. Camm, Mr. Spofforth, Henry Walton, Mrs. Gladstone, Madame Soubeire, George Barnes, Julia Wyatt, J. T. West, Mrs. Shirley Hibberd, James Vick, Mrs. Langtry, Rosetta, Vice-President, William Rawlings, Royal Queen, Willie Garratt, J. N. Keynes, H. W. Ward, Rev. J. B. M. Camm, and Mrs. Saunders.

Mr. John Walker, nurseryman, Thame, was 1st, with thirty-six blooms, not fewer than eighteen

Keith, Earl of Ravensworth, J. W. Lord, T. J. Saltmarsh, John Standish, Ethel Britton, Lady G. Herbert, James Cocker, Criterion, and John Henshaw. 2nd, Mr. George Humphries, Kingston Langley, Chippenham, with Harry Keith, Mrs. Gladstone, W. Rawlings, Maid of Athens (fancy), J. T. West, Cardinal, Earl of Ravensworth, Royal Queen, Henry Walton, Queen of the Belgians, Mrs. Langtry, Bendigo, and Joseph Green.

In the class for twelve blooms there were five entries, Messrs. Rawlings Bros., nurserymen, Romford, being 1st with Gaiety (fancy), William Rawlings, Pelican (fancy), Rev. J. Godday, Prince Bismarck, Mrs. Langtry, Egyptian Prince (fancy), T. J. Saltmarsh, Sunbeam, Prince of Denmark, John Henshaw, and R. T. Rawlings. 2nd, Messrs. J. Gilbert & Son, nurserymen, Ipswich, with F. J. Saltmarsh, J. W. Lord, G. R. Jeffard, Mrs. Kendal, Mr. G. Harris, Harrison Weir, Countess of Lonsdale, a charming soft pinkish colour; and Lord Chelmsford.

*Amateurs' Show Dahlias.*—In the class for twenty-four blooms there were two competitors only, it having severely taxed the resources of amateurs who grow limited collections to get as many flowers, distinct, up to show form. Here Mr. Henry Glasscock, Rye Street, Bishops Stortford, was 1st, with a very good lot of blooms, consisting of Nellie Cramond, Mrs. Gladstone, William Rawlings, T. J. Saltmarsh,

Bride, Mrs. Hawkins, Empress of India, and Mrs. Taylor.

*Pompon Dahlias*.—These made a delightful feature, and being set up in large bunches, proved a very great attraction also. With twenty-four varieties, distinct, Mr. Charles Turner was 1st, with Darkness, Juliette (yellow tufted with orange-red), William Carlisle, Golden Gem, Thomas Moore, White Aster, Cupid, Admiralty, Mabel, Dandy, Leila, Ernest, Innocence, Favourite, Lady Blanche, Gem, The Khedive, Rosalind, Rubens, Isabel, Adonis, Don Juan, E. F. Jungker, and Gazelle. 2nd, Messrs. Keynes & Co., their stand comprising some charming new varieties, such as Red Indian, Eurydice, Eden, White Aster, Rosalie, Karl Guldensch, Fairy Tales, Favourite, Lady Blanche, Darkness, Janet, Little Ethel, Little Duchess, Little Bobby, Rosetta, Gem, and Whisper, pale golden-yellow. With twelve varieties, out of eight competitors, Messrs. J. Burrell & Co., were 1st with Isabel, E. F. Jungker, Mabel, Rosalie, Gem, White Aster, Favourite, Cupid, Darkness, Comtesse von Sternberg, Fanny Weimer, and Golden Gem. 2nd, Mr. G. Humphries with E. F. Jungker, Favourite, H. Melesky, Dora, Golden Gem, Little Nigger, Isabel, Leila, Royalty, and Lady Blanche.

A class of six bunches was open to amateurs only, and there were seven competitors. Mr. J. T. West being 1st, with Mabel, E. F. Jungker, Gem, Isabel, Little Nigger, and Leila. 2nd, Mr. H. Glascock; 3rd, Mr. J. Harris, Broomfield, Chelmsford; 4th, Mr. R. Spinks.

*Single Dahlias*.—These were a highly popular feature also, and they were admirably shown. There was but one exhibitor of twenty-four bunches—Messrs. J. Cheal & Sons—who had a superb stand set up in triangular bunches of ten blooms on their registered wire supports.

In the class for twelve varieties there were seven stands, Messrs. Paul & Son being 1st, with W. Kennett, The Quair, White Queen, Canterbury Tales, Lutes grandiflora, Harlequin, Mrs. H. Whitfield, and Jewel (yellow, new), Mr. Gordon, Mrs. Bowman, The Bruce, Miss Henshaw, and Dulcinea; 2nd, Mrs. M. V. Seale.

In the class for six varieties, open to amateurs, there were but two collections, Mr. T. W. Girdlestone, Sunningdale, Bagshot, being 1st; 2nd, Mr. H. Glascock.

*Seedlings*.—Of these there were a goodly number, the show and fancy varieties being sparingly represented. A First-class Certificate of Merit was awarded Messrs. Keynes, Williams & Co. for fancy Dahlia Matthew Campbell, a distinct and very pleasing variety, bright buff ground, shaded with apricot, and striped crimson; they also had show Dahlia William Jackson, shaded crimson, with bright purple edging. The same award was also made for decorative Dahlia Panthea, very bright pale reddish-rose, a flower of the Juarez type, and very pleasing; Amphion, yellow, flushed with cerise; and Honoria, pale bright yellow, very promising. Also to pompon Dahlias Little Ethel, white, slightly tipped with deep purple, very distinct, pretty, and pleasing; Fairy Tales, delicate primrose extra fine quality; Whisper, bright yellow, with beautiful petal and outline—extra fine; and Eden, deep bright and shaded crimson—very fine shape. They also had Little Darkie, bright maroon—small, good shape; Red Indian, deep bright red—distinct in colour; and Eurydice, bluish, tipped with purple. The same award was made to the following single Dahlias, shown by Mr. T. S. Ware.—R. C. Harvey, yellow, shaded with salmon, and having a red ring round the eye—distinct; Florrie Fisher, having a white ring round the eye, with edging of shaded mauve—very distinct and pleasing; and Mrs. Ramsbottom, pink, shaded with cerise, a charming and distinct variety of great merit. Mr. T. S. Ware also had Kate, orange-maroon—a bright looking flower; and the following decorative varieties:—William Rayner, yellow, shaded with cerise, and tinted with purple; Syreeta Hollings, maroon, shaded with purple; and Professor Baldwin, pale orange-scarlet type of Juarez. The same award to Mr. J. T. West, for decorative Dahlia Beauty of Brentwood, pale shaded purple, with bright purple on the petal edges—distinct and very fine, and quite of the Juarez type; and also for pompon Dolly Keith, white, the centre yellow, tipped with white, the exterior petals occasionally taking this form, the centre being quite white. The same award to Mr. T. W. Girdlestone, Sunningdale, for single Dahlia Daisy, white, broadly edged with mottled rosy-pink—pretty and distinct; and The Mikado, having a yellow ring round the eye, then a broad zone of deep scarlet, edged with prim-

rose—distinct and fine; Marguerite, shaded crimson, is a pleasing flower of excellent form. Some pretty seedlings, single varieties, were shown by Mr. D. T. Fish, Bury St. Edmunds, but they were not considered sufficiently distinct.

Mr. C. Turner had a First-class Certificate for pompon Dahlia Rubens, maroon-crimson, shaded with bright crimson—a small and attractive flower of decided merit, and had the following varieties also:—Kathleen, Innocence, much in the way of Keynes' Little Ethel—thought to be inferior to it; Juliette, yellow, tipped with orange-red; and Admiralty, tipped with purple. Mr. Turner also had the following show Dahlias:—Glowworm, a bright scarlet; a reflexed flower of the W. H. Williams type; Mary Anderson, a light flower like Mrs. Gladstone; and Corsair, buff shaded with gold, the reverse pale purple. The same award to Messrs. J. Cheal & Son, for single Dahlia Queen Victoria, white, with side margins of crimson, medium-sized, and good form; and Duchesse of Albany, silvery-white in the faint pink lines, and edging of orange-brown, both valuable additions to their class; to Mr. Henry Glascock, for single Dahlia Gertrude, a charming variety, having a yellow ring round the eye, then a white zone, a broad ring of pale rosy-purple, with delicate edging of silvery-white. The same award to Messrs. Cannell & Sons, for decorative Dahlia Yellow Juarez, pale primrose-yellow, good and distinct. They also had W. T. Aberly, Lilian Aberly, white, with side edgings of yellow; Conspicua, white, shaded with crimson on the petal margins; Sir Trevor Lawrence, and Lady Ardlaun.

### The Fruit Show.

FRIDAY and SATURDAY, September 7 and 8, saw the inauguration of the important Congress on fruit cultivation which have been announced in the public prints for some months past. It was thought by the managers of the Crystal Palace Co. that a fruit show would be an appropriate adjunct to the chief proceedings on that occasion. The quantity of exhibits brought together was very creditable, and in quality these were quite as good as could be expected. Fruit from the outside is late, and deficient in size and brightness of colour, but that from forcing and orchard-houses was very well coloured, and the bloom and finish of the numerous bunches of Grapes shown was remarkable.

The arrangements were rather puzzling, and not quite understandable. Exigencies of space, convenience of promenading may have had something to do with it; but in absence of knowledge on these points we failed to see why Grapes, for instance, should not be so placed that a comparison between the various lots were easy; and likewise the collections of fruit, which were in some instances on opposite sides of the same table, and hidden from each other by a row of tall plants, or were still further off, making comparisons in this case impossible.

*Collections of Fruit* (open).—In this class Mr. Goodacre, gr. to the Earl of Harrington, Elvaston, Derby, was 1st. The number of dishes shown was twenty, and comprised excellent fruits of the following kinds and varieties:—Downshire Peach, very bright, and of fair size; Oranges, Pitmaston Orange Nectarine, Vicomtesse Héricart de Thury Strawberry, Alnwick Seedling, and Foster's Seedling Grapes, two Queen Pine-apples, and Negro Largo Fig, the remainder being small fruits, &c. Mr. H. Ward, gr. to the Earl of Radnor, Longford Castle, Salisbury, was awarded the 2nd place; his finest examples were—Castle Kennedy Fig, Foster's Seedling Grapes, Queen and Smooth Cayenne Pine-apples, Columbian Plum, and Stirling Castle Peach. Mr. Evans, gr. to J. S. Hodgins, Lythe Hill, Haverham, was 3rd, but he might have stood a chance for a better position had his very fine Hamburg Grapes not been spoiled in transit; La Favorita Melon shown by him was a handsome netted variety, with a flavour said to be excellent. Only three persons competed in the above class.

For twelve dishes of fruit, Mr. A. Miller, gr., Rood Ashton Point, Trowbridge, was 1st, with fine even bunches of Black Alicante and Muscat of Alexandria Grapes; a good Smooth Cayenne Pine-apple, Peaches, Nectarines, Figs, Blenheim Orange and Rood Ashton Melons, &c. Mr. W. Pratt, gr. to the Marquis of Bath, Longleat, was 2nd, having fine Grapes, beautifully finished, and other fruit of great excellence; and Mr. H. W. Ward, Longford Castle, was 3rd.

For eight dishes there were fourteen competing

lots. The 1st prize fell to Mr. R. Parker, gr. to J. Corbett, Esq., M.P., Impney, Worcestershire. Fine fruits were observed in this collection of Princess of Wales Peach, Best of All Melons, Muscat of Alexandria, and Black Alicante Grapes. 2nd, Mr. Waterman, gr. to H. Brassey, Esq., Preston Hall, Kent—Bananas, Royal George Peaches, and Lord Napier Nectarines were well done. 3rd, Mr. C. J. Goldsmith, gr., Kelsey Manor, Beckenham, in this collection were fine Bellegrape Peaches and Newton Nectarines. Fine fruits of the true Beechwood Melon, Rood Ashton Melon, Jefferson Plums, and Stanwick Nectarine were observed in other lots.

*Collections of Grapes*, ten varieties.—1st, Mr. Pratt, Longleat, with Trebbiano, Black Alicante, Black Hamburg, Foster's Seedling, Gros Maroc, Madresfield Court, Muscat of Alexandria, Black Barbados, and Lady Downe's, these being all very good specimens of their respective varieties. Mr. H. W. Ward was 2nd, his finest being Gros Maroc, Lady Downe's Madresfield, Black Hamburg, Gros Colmar and Foster's Seedling.

*Collection of five varieties of Grapes*.—Here the 1st prize was taken by Mr. W. Allen, gr. to Lord Suffield, Ganton Norfolk—Gros Maroc and Duke of Buccleuch, being remarkable for their enormous berries, and fine bloom; Black Alicante was also well finished. Mr. Osman, gr. Ottershaw, Chertsey, was 2nd.

Three bunches of Black Hamburgs.—1st, Mr. J. Taverner, gr. to Sir R. Macdonald, Bart., Woolmer Lodge, Liphook, with medium-sized, very neat bunches, the berries large and well coloured; Mr. J. Chalk, gr. to G. Read, Esq., Wilton Road, Salisbury, was 2nd—the bunches massive, colour excellent but the berries small by comparison with many others. Some very large double bunches secured for Messrs. Rivers & Sons, Sawbridgeworth, the 3rd prize. There were seven competitors.

Three bunches Muscat of Alexandria.—1st, Mr. W. Taylor, gr. to J. Chaffin, Esq., Bath, with uneven bunches, but large and compact, and not too well finished; 2nd, Mr. Pratt, whose bunches were nearly ripe, even as to size of bunches, and berries of equal size. Six competed.

Three bunches of Gros Maroc.—1st, Mr. Gleeson, gr. to the Duke of Portland, Clumber, Notts—massive, well coloured, good in every point; 2nd, Mr. W. Taylor, very large, weight of best bunch was probably 7 lb., long, symmetrical, but had too little finish; 3rd, with Mr. W. Allan, with middling bunches. Nine competed.

In the next class—that for Madresfield Court—the competition was much less, there being only three entries. Here Mr. W. Taylor got the best position with fine bunches; Mr. J. H. Goodacre with bunches of better colour than Taylor's, was 2nd; 3rd, Mr. J. Bury, gr., at Tewkesbury Lodge, Forest Hill, with bunches, which, if they had been better coloured, would doubtless have taken a higher place.

The class for Black Alicantes was better filled than the preceding one, seven gardeners competing. 1st, Mr. Hollingsworth, gr., Woodseat Uxotexter, with bunches of massive proportions, and deficiency in no good point; Mr. W. Taylor, larger bunches, but as with all Mr. Taylor's exhibits of Grapes, deficient in colour; 3rd, Mr. C. Griffin, gr. to Miss Christy, Coombe Bank, Kingston-on-Thames, excellent specimens but of medium size.

Three bunches of any other white Grapes.—For this competition we counted eight entries: 1st, Mr. F. Lee, gr. to Mrs. Lyne Stephens, Lynford, Norfolk, with bunches of Buckland Sweetwater, caught at the right time, and of goodly proportions; 2nd, Mr. Bury, Forest Hill, with Foster's Seedling; Mr. Hollingsworth taking 3rd, with Trebbiano.

Mr. W. Allen showed some very large-berried bunches of Duke of Buccleuch, but not of sufficient ripeness to count.

Three of any variety of black Grapes, seven entries.—1st, Mr. Goodacre, with finished Alnwick Seedling; 2nd, Mr. L. Jennings, gr., Forest Lodge, Farnborough; and Mr. F. Lee 3rd, with the same variety.

Black Grapes were likewise shown in 12 lb. basket, with what object it is not clear, as Grapes are never served up in this way outside a vineyard, and there was no evidence of methods of packing for carriage by road or rail. Mr. J. Bury was placed 1st with Alnwick Seedling—very excellent fruit; Mr. W. Taylor, 2nd, with the same variety; and Mr. Taverner, 3rd, with Black Hamburg. Alnwick Seedling was mostly shown by the other ten competitors.

For the same quantity of white varieties, seven competitors entered.—1st, Mr. G. Duncan, gr. to C.

T. Lucas, Esq., Warnham Court, Sussex, with Muscat of Alexandria; 2nd, Mr. W. Lane, King's Ride, Ascot, with the same variety in a ripe state, which none others were.

The class for six dishes of distinct varieties of Peaches brought numerous entries, most of which were of fair size and good color, but had the appearance in most instances of having been ripened on trees under glass. The 1st prize was awarded to Mr. Divers, Ketton Hall, Stamford; 2nd, Mr. Goodacre, Elvaston Castle, Hall; 3rd, Messrs. T. Rivers & Sons.

For the same number of dishes of Nectarines the winners were respectively Messrs. J. Douglas, Ilford; C. Duncan, Warnham Court; and J. Bury, Forest Hill.

Single dishes of Peaches and Nectarines, small collections of Plums, Figs, and Melons, brought much competition.

A very nice collection of twelve dishes of Apples came from Mr. Waterman, Preston Hall, some of which must be classed as the best in the show. These were Peasegood Nonsuch, Lady Henniker, Stirling Castle, and Ecklinville. Mr. Butters, Southbourne took the 2nd prize.

For three dishes of ripe Apples, 1st, Mr. Waterman, with Red Astrachan, Duchess of Oldenburgh, and Worcester Pearmain; 2nd, Mr. Miller, gr. to J. J. Friend, Esq., Northdown, Margate, with Lady Studly, Red Astrachan and Irish Peach. Other early varieties shown in this competition were Transparent White, Quarrenden, Reineette du Laak and Ecklinville Seedling. In a similar competition for the best ripe Pears, 1st, Mr. J. Butters, with Beurre d'Amanlis, B. Goubalt and Windsor; 2nd, Mr. Waterman, with the first and last in the first-named lot and Bon Chrétien.

The highest prize for a collection of ten varieties of Pears fell to Mr. McIndoe, Hutton Hall, Guisborough. Clapp's Favourite, Beurre diel, Pitmain Duchesse, Brockworth Park, and Daroudeau were his best. The 2nd fell to Mr. Butters, whose fruit was, as usual, of a high colour and fair size.

*Miscellaneous.*—Some very fine Duke of Buccleugh Grapes were shown by Mr. Thomson, Clovenfords, to show the effect of his Vine manure on size of berry.

Fruit trees in pots were exhibited by Messrs. T. Rivers & Sons, Sawbridgeworth, consisting of Peaches, Nectarines, Cherries, Plums, Pears, Apples, Grapes, &c.

Mr. C. Ross, Wilford Park, put up six fruits of Smooth Cayenne Pine-apple of varying degrees of ripeness. Vicountesse H. de Thury Strawberries came from W. Allan, excellent for the season. Mr. F. Muller showed Cherries and Plums. Mr. Evans, of Lythe Hill, Isabella Grapes, and Easter Pippin of the season 1887.

A considerable collection of fruits of various kinds were contributed by Mr. J. Peed, nurseries, Streatham, and some of it was very good for the season, and the soil of that part. Legea, a small tender-fleshed French Apple, introduced by Scott, of Yeovil, was found amongst the sorts shown.

Mr. W. Taylor, Osborne's Nursery, Hampton, showed Apples and Pears in pots, and some dishes of culinary Apples; Messrs. G. Banyard & Co., Maidstone, exhibited fruiting branches of Plums, Damsons, besides twenty-two dishes of Plums, and 100 of Apples and Pears; Messrs. Cheal & Sons, Crawley, had a small and select collection of Apples; Messrs. J. Laing & Sons, Stanstead Nurseries, Forest Hill, exhibited very vigorous fruitful Apple trees, taken from the open ground.

Mr. C. J. Waite took the 1st prize for a collection of six varieties of Tomatoes, and Mr. C. J. Goldsmith the 2nd. Many varieties were exhibited by the various competitors, and chiefly of the Perfection type. Silver's Golden Queen is a fine looking yellow fruit.

*Plants.*—These were found chiefly in several large groups of early dwarf Chrysanthemums, the majority of which were yet hardly well bloomed, and not being so attractive were apparently objects of indifference. The 1st prize was awarded to a stiff group of plants from Messrs. Davis & Jones, Camberwell; Mr. W. Piercy, Forest Hill, coming next; and Mr. G. Miles, Brighton, was 3rd, G. Wermig, primrose-coloured, being the chief feature in this collection.

Cockscombs were largely shown. The best six plants—remarkably fine, rich coloured, and even—were from Mr. Lockie, Messrs. Cheal being 2nd, with good heads; and Mr. Spink, Horley, was 3rd.

Messrs. J. Laing & Son, Forest Hill, staged a huge semi-pyramidal group of their fine Begonias, which suffered somewhat from a bad background, although

effectively dressed with graceful Palms; and Messrs. J. Peed & Sons, in addition to various cut flowers, had a lot of very fair Anthurium Scherzerianum in pots, carrying numerous spathe.

*Cut Flowers.*—These formed a more attractive feature. The large collection of Gladioli from Messrs. Kelway & Sons, of Langport, and from Messrs. J. Burrell & Co., Cambridge, were of exceeding fine quality, but indication of the choicer varieties is out of the question here. The latter firm only competed in the class for large collections, and were awarded the 1st prize. Only two amateurs—the Rev. H. D'Ombrian, Westwell Vicarage, Asford, and Mr. E. W. Weston, Calne—competed in the class for eighteen spikes, the former, who was placed 1st, having capital flowers, which showed that amateurs may do this fine autumn flower well. Mr. E. Jones, Bath, had the best twelve spikes; Mr. H. Apthorpe, Cambridge, being 2nd. Hollyhocks, in single blooms, were in but moderate form, the best flowers being found in the twenty-four from Messrs. Webb & Brand, the successors to Mr. Chater, of Saffron Walden.

Mr. Apthorpe had the best twelve blooms; Mr. Blandford, of Dulwich, being 2nd.

Asters made a better show. Although not up to the standard mark, many of the flowers, especially the quilled kinds, showing the effects of the rain appreciably.

Of French or flat-petalled kinds there were fourteen collections of twenty-four blooms, the best being a clean lot from Mr. Jones, of Bath, but rather wanting in variety of colour, blue tints predominating; these were all Victorias: whilst the 2nd lot, which came from Messrs. Saltmarsh & Sons, Chelmsford, was varied, and had capital incurved and Peony-voiled forms. Mr. Waller, Calne, was 3rd, with Victorias.

Messrs. Saltmarsh were 1st, with the best twenty-four quilled Asters, rather wanting in size, but fairly clean; Mr. Waller coming 2nd.

Mr. Glasscock, Bishop's Stortford, exhibited a large reflexed Aster in quantity, the flowers being red, with white stripes or edges, the petals rather long and narrow, but, on the whole, rather wanting in fullness.

Stove and greenhouse flowers made a prominent feature, being shown in three collections, comprising some twelve bunches, being shown; that placed 1st, from Mr. Prewett, Hammersmith, consisted of sixty sorts, and included several good Orchids, Begonias, Dipladenias, Lapagerias, and other choice flowers. Mr. A. Gibson, gr. to J. A. B. Atkins, Esq., Sevenoaks, was 2nd, with thirty bunches; and Mr. H. James, Norwood, was 3rd.

Amongst various honorary collections were capital lots of cut double and single zonal and Ivy-leaved Pelargoniums, finely set up; some pretty Cactus Dahlias, and some charming Godetias, from Messrs. Daniels & Sons, Norwich.

Messrs. Paul & Son, Cheshunt, showed numerous boxes of Roses, and a large variety of hardy flowers. Mr. E. Such, Maidenhead, showed a fine collection of border flowers in bunches. Messrs. Kelway had good Gaillardias and Delphiniums; and Messrs. Dobbie & Sons, Rothsay, had fine French and African Marigolds, Violas, and other pleasing flowers of excellent quality.

## NATIONAL CHRYSANTHEMUM SUMMER SHOW.

ROYAL AQUARIUM, Sept. 12 and 13.—This was a great improvement on the show held a twelvemonth ago. Chrysanthemums being very numerous and fine for the season of the year, and Dahlias were in admirable condition, of better quality than at the Crystal Palace, and Mr. C. Turner was in very fine form, taking off the 1st prizes for forty-eight, thirty-six, and twenty-four blooms: while in nearly every class there was a remarkably good competitor.

*Chrysanthemums, Plants.*—The best group of plants to fill a space not exceeding sixty square feet was fine, Mr. J. H. Witty, Highgate Cemetery, who had a good lot of well-grown and bloomed plants, finished off with an edging of Ferns, the leading varieties being Golden Fleece, Madame Desgranges, Mr. G. Wermig Blushing Bride, Chromatella, Alice Butcher, Mille, Leoni Lasalia, &c. Mr. H. Neary, gr. to the Rev. Mr. Powell, Horsey, was the only exhibitor of twelve plants, having six well-grown and bloomed trained specimens, each of Madame C. Desgranges and Mr. G. Wermig.

*Chrysanthemums: Cut Flowers.*—In the class for collection of cut blooms, Mr. T. S. Ware, Hale

Farm Nurseries, Tottenham, had a very good collection of over thirty varieties in double that number of bunches, the leading varieties being St. Crout's Nanum, Piercy's Seedling, Précoceité, Hibernia, Blanche Colomb, Early Blush, La Vierge, Flora, Madame C. Desgranges, M. Jolivet, Mrs. Fisher, Blushing Bride, Mrs. Burrell, Mille, H. Lasalia, Toreador, Pettulant, Mrs. Cullingford, Fred. Pile, Canari, Mr. G. Wermig, and St. Mary. 2nd, Mr. R. Owen, Floral Nursery, Maidenhead, whose leading varieties were:—M. W. Piercy, Flora, M. Jolivet, Toreador, Fanchette, Canari, and Madame Domage. An extra prize was awarded to Mr. George Stevens, St. John's Nursery, Putney.

Mr. J. Blackburn, gr. to J. Scott, Esq., Chislehurst, had the best twelve blooms of Madame C. Desgranges, very fine indeed; Mr. J. Hudd, gr. to F. W. Price, Esq., Blackheath, being 2nd. Mr. H. Elliott, gr. to Mrs. L. Harrison, Leydon House, Mortlake, had the best twelve blooms of any other variety or varieties, staging twelve fine ones, of Mr. G. Wermig; Mr. A. D. Clarke, gr. to W. Brand, Esq., Finchley, being 2nd, with good blooms of Elaine, General Gordon, Chang, Sam, Henshaw, Mona, G. Wermig, &c.

Mr. H. Witty, was the only exhibitor of twelve bunches of pom-pom varieties, three trusses of each, having Golden Fleece, Mrs. Cullingford, Alice Butcher, Nanum, Madame Picot, Blushing Bride, Lyon, Souvenir d'un Ami, Frederick Pile. Précoceité, &c.

Mr. W. Scott, 7, Ifield Place, South Kensington, had the best six bunches of Madame Desgranges, set up in bunches of three blooms; Mr. J. Hudd, gr. to F. W. Prior, Esq., Gordon House, Blackheath, being 2nd.

The best six bunches of any other kind, except Madame Desgranges, came from Mr. J. Doughty, gr. to Mrs. M. Tindlin, Angle Park, Cranbrook, Kent, being 2nd.

*Miscellaneous.*—Gladioli were well shown by J. Burrell & Co., nurseries, Cambridge; show Dahlias by Mr. C. Turner, Slough; Messrs. Keynes, Williams & Co., Salisbury. Pom-pom Dahlias were plentiful and very good, Mr. C. Turner exhibiting the best, and Messrs. Chesham & Son, Crawley, the second best. Twenty-four bunches of Messrs. Chater taking the 1st prize for twenty-four bunches of single Dahlias. Mr. E. Such, florist, Maidenhead, had the best collection of decorative Dahlias of the Jureaz, type. The Silver Gilt Medal of the Society was awarded to Messrs. J. Laing & Co., Stanstead Park Nurseries, Forest Hill, for a very fine group of variegated stove plants, Begonias, &c. Silver Medals to Mr. T. S. Ware, for Dahlias and hardy plants; and to Mr. H. Cannell, for Dahlias and Cannas, both groups greatly helping the show; also to Mr. A. W. Gordon, Twickenham, for a very fine group of Lilies. A Bronze Medal was awarded to Mr. E. F. Such, for an interesting collection of bunches of hardy flowers. A collection of apples from Messrs. B. Peed & Sons, nurseries, Streatham; and also of fruiting trees in pots, and dishes of Apples from Mr. A. Taylor, florist, Hampton, were commended.

*Fragrants.*—Prizes were offered by Messrs. H. Deverill & Co., Basing, for the best twenty pods of Neals Ne Plus Ultra Runner Bean, a very good lot being shown. Mr. G. H. Richards, Sonmerley Gardens, Ringwood, was 1st; and Mr. Waite, Glenhurst, Esher, 2nd. Also special prizes were offered for Middleton Park Beet, Deverill's Scarlet Horn Carrot, and Scarlet Intermediate Carrot, six of each being shown. Here Mr. H. Pope, The Gardens, Highclere, Newbury, was 1st, and Mr. Waite 2nd.

*The Floral Committee.*—A meeting was held at the Royal Aquarium on the 12th inst., Mr. E. Sanderson in the chair, there being a good attendance of members. An orange-coloured sport from Chrysanthemum Précoceité, shown by Mr. H. W. Pilcher, Surbiton, was Commended. First-class Certificates were awarded to Chrysanthemum Mr. Bennett, a golden sport from Mr. G. Wermig, from Messrs. Hawkins & Bennett, Twickenham; and to Fanchette, a pretty and useful pom-pom, warm pink, with silvery tip and reverse, very free, from Mr. R. Owen, Maidenhead, who also received a Commendation for Canari, a pure yellow early flowering pom-pom, small, fine, shape and very free; and First-class Certificate for double Ivy-leaf Pelargonium, Robert Owen, rich bright carmine, very double and forming a bold truss; and for an fine silver variety named Victorious, pale bright salmon-cerise, very large bold truss. To Chrysanthemum Mr. J. Pitcher, an early flowering incurved white variety, shown by Mr. J. P. Kendall, Roehampton. The same award was made to the following Dahlias:—The Mikado (single), from Mr. T. W. Girdlestone; Gertrude (single), from Mr. H.

Glasscock; Miss Ramsbottom (single), from Mr. T. S. Ware; to Victoria (single), from Messrs. J. Cheal & Sons; and to pompon, Fairy Tales, Little Ethel, and Little Darkie, from Messrs. Keynes, Williams & Co., and to decorative Dahlia Panthea, from the same. To Mr. C. Turner for pompon Dahlia Admiration, red, tipped with white; to the Messrs. Dickson & Sons, Chester, for Carnation, Mr. Reynolds Hole; to Mr. Frank Glasscock, Bishops Stortford, for Asters Comet and Triumph, the latter a deep chestnut crimson-coloured flower of the Peony type; to Mr. R. Dean, for Mimulus moschatos ruber; to Messrs. J. Burwell & Co. for Gladioli, Mr. Lindsill and Ehyllis; and to Mr. J. T. West, for decorative Dahlia, Beauty of Brentwood, bright purple.

### NEWTOWNSARDS HORTICULTURAL.

THIS enterprising Society held its thirty-third annual show on the 6th inst. in the grounds reserved for it in the nursery of Messrs. Alexander Dickson & Sons, Newtownards. It is the most flourishing horticultural society in Ireland, and enjoys the patronage of the nobility and gentry over a wide and prosperous district. Few horticultural societies in the United Kingdom are favoured with a more practical business-like and energetic committee and secretary. Every detail is well conceived and carried out by them. Few, if any other provincial society, can boast of owning the whole plant requisite to the carrying through of every detail in connection with a flower show of the extent of that at Newtownards. It is substantial evidence of the excellent financial condition of this Society that it owns the several large marquees and smaller tents and everything else required in its annual operations.

The prize schedule comprised 279 classes in six sections, viz., plants in pots, cut flowers, fruits, and vegetables, roots and cereals, and butter, eggs, and honey. The first four sections are divided into sub-sections for amateurs who keep a gardener, amateurs who do not keep a gardener, nurserymen, and cottagers. The nurserymen's sub-section appears only in the first and second sections. The entries in all reached to the total of about 1200. A special feature in the schedule appears in the cottagers' classes for plants in pots, cut flowers, fruits, and vegetables, being a set of prizes offered by the Irish Peasantry Society of London, amounting to nearly £20 in all, so provided as to encourage the peasants of the district to improve the vegetable and fruit products of their gardens especially, and also their taste in the culture and management of flowers.

The show was altogether good alike as regards quality and quantity, though it was said to be inferior to preceding ones. The weather for the first time in the course of the thirty-three years' record of the Society was somewhat unfavourable on the day of the show, but did not prevent the public of all classes attending in thousands, the day being regarded as a district holiday, and duly taken advantage of.

Pot plants were well represented in all the sections, and were well cultivated and numerous. In the first sub-section—amateurs who keep a gardener—S. Black, Esq., Glen Ebor (gr., Mr. R. Bissett), and G. Wolff, Esq., The Dew gr., Mr. W. A. McIlroy, took 1st and 2nd prizes respectively in the class of ten stove and greenhouse plants, not less than three in flower. In six stove or greenhouse plants, two in flower, John Mulholland, Esq. (gr., Mr. Crane), took the 1st place. For six stove or greenhouse plants in pots, not exceeding 10 inches, S. Black and G. Wolff again divided honours in their order. A table of plants was contested for by the last two gentlemen with the same result; and in the competition for six exotic Ferns they held the same relative positions, and again also in the competition for two Palms they were in the same order. Four very fine Cockscombs came from A. M. Kirker, Esq., Craigavad (gr., Mr. Wm. Watson), which were deservedly awarded 1st prize.

The productions in pot plants of amateurs who do not keep a gardener were numerous and good. Ivy-leaved Pelargoniums were splendidly shown by Dr. Henry, of Comber, who took 1st prize. The collections of greenhouse were numerous, the best coming from Israel McHenry, Lisburn, and J. W. Ritchie, Comber. The best zonal Pelargoniums were tabled by the last named competitor, as were also the best show Pelargoniums, two Coleus, the best Lily of any variety, and the best three Balsams. W. S. Johnson took 1st honours in the class of one Lilium auratum. Mr. Hugh Gordon beat all comers in two

pots of Mignonette, and W. S. Johnson excelled all in tuberous Begonias.

In the nurserymen's classes for plants in pots, Messrs. Alexander Dickson & Sons, Newtownards, and Mr. Hugh Dickson, Belmont Nursery, had the competition between them. The latter took 1st prize in the competition for a group of stove and greenhouse plants, which was composed of a well-grown, well-coloured lot of foliage plants, including a grand specimen of *Cycas circinalis* and flowering plants, among which were some capital Orchids, Begonias, *Lapageria alba*, *Ericas*, *Bouvardias*, &c., set up with fine taste. Messrs. Alexander Dickson & Sons' group was also a good one.

*Cut Flowers*.—These, taking the season into account, were numerous, but space will not admit of our particularising closely the different exhibits. Dr. Dunlop, Holywood, was the principal prize-taker among Dahlias and Roses in the section "Amateurs who keep a gardener," and Mr. Kirker, Craigavad, who took the 1st prize for the largest class of Dahlias, viz., twenty-four blooms, carried off also first honours for eighteen gladioli, and other important prizes.

African and French Marigolds were very good, which is rather a rare occurrence this season. The best of the former came from Dr. Dunlop, and of the latter from Mr. Kirker.

In the nurserymen's section, cut flowers, the competition was divided between Messrs. A. Dickson & Sons and Mr. Hugh Dickson, and the honours were keenly contested, both sustaining their well-earned fame as Rose and Dahlia growers.

*Fruit*.—The exhibits were scarce, and below the average in quality as regards hardy kinds, but there were some excellent examples of Grapes, Peaches, Nectarines, and Plums. The best Grapes came from Lord O'Neill, Shane's Castle, Antrim (gr., Mr. C. Warwick), who took 1st honours for six bunches, in four varieties, and in two bunches of black Grapes. R. E. Ward took the 1st position in the competition for Black Hamburgs, and G. W. Wolff for white Grapes. R. E. Ward was 1st in Peaches, and also in Nectarines and Figs.

The cottagers' classes were well represented, the productions in every case being of high merit, and the same be said of the field produce.

## SCOTLAND.

### GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

THE autumn show of this Society was held in the Grand Hall and in several tents in the International Exhibition grounds, Kelvin Grove, Glasgow, on the 12th inst. The show was worthy of the metropolis of the West of Scotland, and a credit to the committee of the Society.

Fruit was a conspicuous feature, and some of the leading prizetakers at the Royal Caledonian show of last week were among the most successful here also; indeed, in not a few of the departments the successful competitors at the show in the East have again distinguished themselves in the West.

*The Grand Hall*.—The plants and fruit here set up made an imposing picture; the latter was ranged on the side tables, and three tables running the entire length were occupied with plants for competition and exhibition.

*Groups*.—The orchestra was decorated with a collection of foliage and flowering plants from the Botanic Gardens, Glasgow, set up with good taste by Mr. Bullen. Space forbids particularising the many interesting and beautiful foliage plants, but we must mention a plant of *Lissocylus giganteus*, with a fine spike of flowers.

The large space surrounding the throne used by the Queen, was decorated by Messrs. Little & Ballantyne, Carlisle, with a group of foliage plants—such as *Crotons* and *Dracenas*, as regards colour and superior culture have never before been seen at any show in Scotland. Many other varieties of foliage plants contributed to the elegance and interest of the group, each in its kind being perfect.

Messrs. Smith & Simmons had good exhibits of stove and greenhouse plants—both flowering and foliage; and Messrs. Austin & McAslan occupied a similar space on the right-hand tables at the western end of the hall.

Immediately below the Botanic Garden exhibits were placed the only two groups entered for the first class in pot plants, viz., a group of miscellaneous plants arranged for effect on a space not exceeding 300 square feet. The 1st prize went easily to Messrs. I. & R. Thyne, with stove and greenhouse plants, which included well coloured *Crotons* and *Dracenas*, *Liliums*, *Pancratiums*, *Statice*, *Begonias*, &c., relieved with *Cocos* and other Palms; 2nd, Mr. Jas. Bryson, Parkhead Nursery, Helensburgh.

In the open classes of six stove and greenhouse plants in flower Mr. Hugh Millar, Auchentraith, Bothwell, was 1st, with *Phenocoma Barnesii* and *Lapageria alba* as conspicuous subjects in his collection; 2nd, Mr. Hogg, Aitkenhead, Cathcart, with an excellent lot.

For six stove and greenhouse plants (foliage plants), Mr. Raeside, Dumbarton Road, Glasgow, was 1st; and Mr. Matheson, Westbank, Partick, 2nd—both very good groups.

Six exotic Ferns.—1st, Mr. Neil, Greenhead Street, Newmilns; Mr. McIntyre, Darlington, 2nd.

Three *Ericas* in flower.—1st, Mr. Neil; 2nd, Mr. Boyes, Burnpark, Uddington.

Three specimens, Orchids in flower, Mr. Wilson Westmount, Kelvinside, 1st; Mr. D. Paton, Milrig, Galston, 2nd.

Six Pitcher plants.—1st, Mr. Sutherland, Lenzie 2nd, Mr. Hogg.

Twelve table plants, foliage.—1st, Mr. McIntyre 2nd, Mr. Agnew, Ascog, Bute.

Six table plants in flower.—1st, Mr. Grossart, Oswald House, Oswald Road, Edinburgh; 2nd, Mr. Sutherland.

Dinner-table decorations were numerous, the first going to Mr. Donald McIntyre.

*Cut Flowers* were numerous and excellent. Dahlias perhaps not so good as usual. The best in the open classes came from Mr. Boston, Carthorpe, Bedale, Yorks. The best single Dahlias were tabled by Mr. Walker, florist, Gateshead, Low Fell. The finest Hollyhocks, both blooms and spikes, were put up by Mess. Kerr & Sons, Kalemouth, Roxburgh; and these were superior to anything of the kind recently seen in Scotland. The 1st prize lot of twenty-four Gladioli came from Messrs. McGrady & Son, Portadown, though they were very closely pressed by those tabled by Mess. Alex. Dickson Newtownards.

*Roses*.—The 1st prize twenty-four were shown by Messrs. Cocker & Sons, Aberdeen; Messrs. Croll, Dundee, making a good 2nd.

*Pansies: Show Varieties*.—Of these the best twenty-four came from Mr. Sutherland, Lenzie; as did also the best twenty-four fancies.

*Carnations and Picotees*.—In these Mr. Campbell, High Blantyre, took the 1st position with very fine examples.

*Baskets and Bouquets of Flowers*.—In all classes of these Messrs. Perkins & Sons, Coventry, had it all their own way. Owing to pressure of space, it is impossible to deal with the remaining classes of cut flowers in detail.

*Vegetables*.—These were very fine, and competition was keen and close, especially in collections, the 1st prize for which falling to Mr. D. McBean in the gardeners' class, and to Mr. James Kidd in the amateurs' class.

A special prize of £10 for ten stove and greenhouse plants was taken by Mr. Sutherland; Mr. Grossart being 2nd.

There were many exhibits from nurserymen and florists.

Messrs. Dobbie & Co. had fine display of their specialties, such as Dahlias, Marigolds, and choice selections of vegetables.

Mr. Kerr, Dumfries, a numerous collection of Potatoes.

Messrs. Munro & Ferguson, Edinburgh, had a collection of hardy herbaceous plants, including their new *Matricaria inodora* fl.-pl. Snowflake, which received a First-class Certificate.

Messrs. Cocker & Sons, Aberdeen, had a splendid

mass of Roses, Tea and H.P., and herbaceous cut flowers.

Mr. Lister, Pentstemon, Antirrhinums, Gladioli, &c.

Laing & Mather had hardy cut flowers, and their new Carnation R. H. Elliot.

**Fruit: Grapes.**—These were in great force, and the chief point of interest was in the competition for the Veitch Memorial Medal and £5, for which two bunches black and two bunches white Grapes were required. Mr. McHattie, Newbattle, Midlothian, carried off the coveted prize easily, with splendid examples of Muscat of Alexandria; Duke of Buccleuch, Madresfield Court, and Black Hamburgh; Mr. Day, Galloway House, Garlieston, was a good 2nd; and Mr. Barrie, gr. to G. T. Couper Esq., Row, was 3rd.

In the class of eight bunches, four distinct, Mr. McKinnon, Melville Castle, was a good 1st, with fine Gros Marec and Black Alicante as the most meritorious examples; Mr. McKelvie, Broxmouth Dunbar, being a good 2nd. Two bunches Black Hamburgh brought Mr. McHattie again to the front with Mr. McKinnon 2nd. Two bunches Black Alicante placed Mr. McKinnon 1st, with superb bunches, and Mr. McConnochie, Cameron House Alexandria, 2nd. Two bunches Gros Colmar placed Mr. Murray 1st. Two bunches White Muscat brought superb examples in from Mr. McHattie; and Mr. McKinnon took 1st in two bunches of any sort with beautiful examples of Golden Hamburgh. The heaviest bunch, a White Syrian, was shown by Mr. Murray, and weighed 20 lb.

The collection of sixteen dishes of fruit was keenly contested, the 1st prize falling to Mr. Boyd, Callendar House, Falkirk; eight dishes were equally well contested, the victor being Mr. McKelvie. Collections of six dishes of hardy fruit, though somewhat numerous, were unequal, Mr. Fairgreive, Dundel, distancing all his opponents easily.

Pines made a poor show, the best Queen coming from Mr. Grossart, Oswald House; and the best Smooth Cayenne from Mr. McIntyre, The Glen, Innerleithen.

Melons were few, the best green-fleshed being tabled by Mr. McIndoe, and the best scarlet-fleshed by Mr. Weir, gr. to Sir R. Cunliffe, Acton, Wrexham.

**Peaches.**—The best twelve came from Mr. McIndoe and the best six from Mr. Wilson, Auchencuive, Ayr.

**Nectarines.**—Mr. McIndoe again tabled the first twelve, and also the best six Apricots.

**Figs.**—In these Mr. McHattie was an easy 1st.

**Plums,** twelve Green Gage.—Here Mr. McIndoe was a good 1st. Mr. Wilson was best in light twelve Plums of any other sort; and Mr. Gallagher, Kilkerran Gardens, Maybole, took the lead in red or purple Plums.

**Pears** grown under glass were best, presented by Mr. McIndoe; and from the open air by Mr. Day. The best Jargonelles came from Mr. McDermott, Alva House, Alva.

**Apples** (dessert, grown under glass).—The finest twelve came from Mr. McIndoe; the best twelve, grown in the open air (dessert), from Mr. Wilson; and the best twelve kitchen from Mr. Boswell, Albert Place, Stirling.

**Cherries.**—The best fifty were put up by Mr. Fairgreive.

#### NORTH OF SCOTLAND APIARIAN SOCIETY.

The annual show, under the auspices of this Society, was brought to a close in the Duthie Park, Aberdeen, on the 1st inst. There were twenty-three classes in the show, and a number of entries were made in each. This year, however, the entries numbered scarcely more than half of those of last year, owing to the ungenial weather. For some time past, bees in the northern districts rarely had an opportunity of getting out, and in consequence many of them died, while, in most cases, they lived on stock honey, and had, moreover, to be fed. Consequently the exhibition was meagre in all depart-

ments, except that for bee furniture, of which there was a good display. A new feature, introduced this year, was the "driving" competition, which consists in driving the bees from a straw hive into a wooden one, at the same time catching and exhibiting the queen—the operation being performed by the competitor with unprotected hands and person. In this competition, Mr. Richard McGregor, Inchmarlo, Banchoy, carried off the 1st prize, and was, in addition, awarded a Third-class Expert Certificate for proficiency in apiculture. The show was opened by the Rev. Mr. Innes, Free Church, Skene, Aberdeenshire, President of the Society, in presence of a large audience.

#### THE BOTANIC GARDEN, GLASGOW.

A few days ago I had the great pleasure of visiting Mr. Bullen at the Botanic Garden, Glasgow, and getting a look round the very fine and extensive collection of plants under his care. As a whole I never saw the collection look better, notwithstanding the many difficulties he has had to contend with, having his staff reduced to the lowest possible number, and the gardens closed to all and sundry. I find the only means of getting an entrance is to write to Mr. Bullen, that he may send a man to open the gate. Amongst the Orchids how astonished I was to find the rare and beautiful *Lissochilus giganteus* in bloom, and still more struck it because I was led to believe that all the plants in Europe did not amount to half-a-dozen, while here was a large plant with several flowering growths, and I proud of having charge of one small lead! The whole plant corresponds exactly with the description given of the one flowered by Sir Trevor Lawrence in May last, described and figured in the *Gardeners' Chronicle* May 19, p. 616, except that the lip is not purple, but merely a deeper shade of rose than the petals, and without the darker stripes in the figure. It is a grand Orchid, a free grower, and will be easily managed. As we passed on it struck me as a great pity, as well as a loss to horticulture, that so many fine things should be left to bloom there unseen, unknown, and almost unheard of. *Robert Todd, Woolton Wood, Liverpool.*

## THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING SEPT. 22. (AVERAGE OF FORTY-FOUR YEARS.)

Sept. 16 ... ..	57.6	Sept. 20 ... ..	56.9
" 17 ... ..	57.3	" 21 ... ..	56.7
" 18 ... ..	57.2	" 22 ... ..	56.6
" 19 ... ..	57.1	Mean for the week ...	57.1

#### THE PAST WEEK.

The following summary record of the weather for the week ending Sept. 10, is furnished from the Meteorological Office:—

"The weather has continued rather unsettled in parts of the kingdom, with occasional falls of rain. Thunderstorms occurred over central and eastern England on the 7th, and on the 9th thunder and lightning were prevalent at many of our southern and eastern stations.

"The temperature has again been below the mean, the deficit ranging from 2° to 4°. The highest of the maxima were recorded either on the 4th or 5th, when the thermometer rose to between 64° and 69°. The lowest of the minima, which were registered towards the end of the period, ranged from 30° to 34° in Scotland, 34° to 35° in Ireland, and from 33° to 43° over England.

"The rainfall has about equalled the mean in 'England, N.E.', but in all other districts it has been less; the deficit being most marked in the 'grazing districts,' and the east of Scotland.

"Bright sunshine has been more prevalent than it was last week in Scotland, the south of Ireland, the south-west of England, and the 'Channel Islands,' but in nearly all other districts a decrease is shown. The percentage of the possible amount of duration ranged from 21 in 'Ireland, N.' to 44 in 'Ireland, S.'

45 in 'England, S.W.' and 56 in the 'Channel Islands.'"

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, DO PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

**ARALIA VEITCHI: A. H. B.** This plant is difficult to root, and is usually grafted very low down on *A. reticulata*, cuttings of which strike readily. The grafting may be done at almost any time of the year if you are provided with a close-fitting

propagating case, or box, but the early spring is the better time, employing young ripened wood for the scion. Grafting-wax should be used to exclude water from the parts operated on.

**BOOKS:** O. S. *The Orchid Manual* (B. S. Williams); *Reichenbachia*, the *Orchid Album* (B. S. Williams and R. Warner); Veitch's *Manual of Orchidaceous Plants* (J. H. Veitch); *How to Lay Out a Garden* (E. Kemp); *Landscape Gardening* (T. Loudon).

**CARNATIONS DISEASED:** *Carnation*. Your examples represent a very bad case of disease as caused by the minute eel-worms, or nematodes, described and illustrated in the *Gardeners' Chronicle* for December 3, 1881, p. 721. The nematodes infest every part of the interior of the plants, from the roots to the leaf-tips. We found but few in your leaves, as the worms had mostly escaped, but the roots and stem-bases were swarming with eel-worms. The wet season has been very favourable for nematodes. They are easily destroyed by any slightly corrosive solution, or by a solution of quinine, but it is almost impossible to apply any remedy, as the nematodes live within the plants affected. They often swarm in the soil, but the soil again acts as a filter to liquid remedies, and the worms live on. Lime is fatal to them. In cases like yours gardeners usually dig the diseased plants up carefully and burn them. *W. G. S.*

**COKE:** X. Y. Z. This fuel will not burn well when saturated with moisture; in that way it may be injured by long exposure.

**DAMAGED GRAPES:** J. L. The berries are what are called "ruined," the exact cause of which is not known. Excessive use of sulphur on the heating apparatus; cold draughts coming into contact with the berries when very young; handling carelessly. There is no cure, and all berries whose appearance indicates must be cut out of the bunches when observed.

**EVERBEARING CUCUMBER:** Jas. M. T. & Co. The season has been so unfavourable this year for out-of-door Cucumbers that we do not think a fair opinion can be given. The plants flowered, but grew but little, and no fruit set.

**LAUREL:** P. The growths on your Laurel are adventitious roots, such as are formed on Vines. Thin out the branches, and let in more light and air, and they will dry up and disappear. They do no harm.

**NAMES OF FRUIT:** *Thos. Imrie & Sons*. Egg, or White Paradise, Apple.—*H. H.* We do not recognise the fruits you sent.

**NAMES OF PLANTS:** S. E. M., *Bedale*. The Poppy is one of a form, called the Shirley Poppy; the other flower is *Helenium Bolanderi*.—*J. C. & Co.* *Veratrum nigrum*.—*E. C. G.* *C. Calamintha officinalis*; *C. cinopodium* is not the same as *C. acinos*, perhaps it is mentioned in your book as *Cinopodium vulgare*.—*G. H.* should address the Editor. 1, *Cladodendron foetidum*; 2, *Saponaria officinalis*; 3, *Pellaea flexuosa*.—*H. P.* *Polygonum cuspidatum*.—*Hants*. Your *Rhododendron* has altered its mind and developed a leaf-shoot in place of waiting to produce flowers next spring. Traces of the flowers are visible. No doubt it is due to the wet season.—*A. D. W.* *Cornus mas*, the Cornelian Cherry.—*Amateur*, *Pevensley*. *Hypericum Hookerianum*.—*Tyro*. 1, *Smilax aspera*; 2, *Silene acaulis*; 3, *Anagallis arvensis*; 4, *Filago germanica*; 5, *Polypodium pustulatum*, 6, the Pear leaves are affected with the Pear-mite. Sweep up the leaves and burn them.—*G. P.* *Gentiana Amarella* and *Anthyllis vulneraria*, yellow. The insect is *Sirex gigas*.—*D. T.* *Glauclium luteum*—horned Poppy.—*R. L.* *Potentilla fruticosa*.—*F. P.* *Asclepias syriaca*.

**RONDELETIA SPECIOSA:** A. J. B. This plant flowers in the summer and autumn, and requires stout treatment during the greater part of the year. After flowering allow the plant to rest for three or four weeks, cutting back the shoots half way, and generally regulating the strong growths, if there be any, by tying them down rather than by cutting back. Plants which have bloomed early may, after their rest, be either top-dressed, if not very well rooted, or shifted if the latter be the case. Late-flowering plants may be slightly top-dressed, and shifted early in March the following year. During winter watering should be done only when the ball is moderately dry, and no growth should be made during that period. A night temperature of 55° to 60°, ranging 10° in the day, is high enough from

November to the end of January, when that of the day may be slightly increased. A mixture of two-thirds fibry peat, one-third sifted loam, and enough sharp sand to make the mass porous, is suitable. In spring and summer the treatment afforded to the other stove plants will do.

**TOMATO DISEASE:** F. C. is not a very difficult reader of his *Chronicle*, or he would remember that the disease has been described repeatedly. It is, as he says, closely allied to the Potato disease. Burn the affected plants.

**TROPEOLUM LEAVES:** R. H. T. The appearances point to something being wrong at the root, or to injury by sulphur fumes. We detect neither insect nor fungus.

## SEEDS.

LONDON: Sept. 12.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report a good speculative business doing in Clover and other seeds, with a further material advance in values. Continental and home accounts of the growing crops continue most unsatisfactory. Trifolium has lately been in diminished request. Winter Tares offer less freely, and are dearer. Sowing Rye keeps steady. There is no change in bird seeds. Much higher prices are asked for blue Peas. Feeding Linseed is firmer.

## FRUIT AND VEGETABLES.

SPITALFIELDS: Sept. 12.—Good supplies of fruit, fresh vegetables, &c.; trade heavy. Potato supplies not quite so large owing to harvest operations. Demand better at slightly higher rates. Prices:—Fruit: Damsons, 2s. 6d. to 3s. per half sieve; English Green Gages, 6s. to 7s. per bushel; foreign do., 2s. 9d. to 3s. per half-salt; English Plums, 2s. to 2s. 6d. per half-sieve; foreign do., 1s. 6d. to 2s. per basket; Pears, 3s. 6d. to 4s. 6d. per bushel; Apples, 3s. 6d. to 5s. do.; do., 1s. 6d. to 2s. 9d. per half-bushel; English Tomatoes, 5s. to 6s. per sack; foreign do., 2s. 6d. to 3s. 3d. per box of about 15 lb. ## CERTAIN SUDDEN DEATH

To all Grubs, Aphs, Lice, Red Spider, Thrip, Mealy Bug, Caterpillars, &c., &c.

PERFECTLY }  
HARMLESS } Ringworm in Animals, and all diseases produced by parasites.

# FIR TREE OIL (SOLUBLE) INSECTICIDE

A combination of Hydrocarbon Oils, made soluble in Water, for destroying ALL INSECTS & PARASITES that infest Trees and Plants, whether at the Roots or on the Foliage.

Sold by Seedsmen and Chemists, 1s. 6d., 2s. 6d., & 4s. 6d.; ½ gallon 7s. 6d., 1 gallon 12s. 6d., or less in larger quantities.

A Treatise on FIR TREE OIL as an INSECTICIDE, its application to Plants and Animals, sent Post free on receipt of address, by the Manufacturer.

## Important Notice.

FIR TREE OIL so well-known as an Insecticide, is effectual for washing household Cotton, Linen, and Woolen Fabrics, and its disinfecting, bleaching, and cleansing qualities when added to water for washing purposes, will, after the first trial, recommend itself.

No Dry Soap or any such preparations must be used with Fir Tree Oil.

Half a wineglass-full of Fir Tree Oil to 10 gallons of water for cleaning, and the same quantity to an ordinary size boiler for boiling, with half the usual quantity of household soap, will do the work splendidly, and with half the trouble.

For washing Dogs, Pigs, and other animals, half a wineglass-full to a bucket of water, and used with ordinary soap, will do better than any of the prepared soaps for killing fleas, preserving the skin healthy, and making the coat silky and very beautiful. One trial will be conclusive.

P.S.—Paraffin Oil will mix with Fir Tree Oil in proportion of a quarter of a pint of the former to a pint of the latter, and become soluble in water.

E. GRIFFITHS HUGHES, Manchester.

Wholesale: Hooper & Co.; Conner, Sober, Fowler & Co. C. E. OSMAN & Co.; and from all the London Seed Merchants and Wholesale Patent Medicine Houses. NEW YORK—ROBERT & SONS.

## PEAT for ORCHIDS,

AZALEAS, HEATHS, FERNS, RHODODENDRONS, &c.

The Best in the World.

A. JOHNSON AND CO., 23, Leadenhall Street, London, E.C., continue to receive the highest testimonials (unsolicited) from large Orchid Growers, stating the ORCHID PEAT supplied by A. J. & Co. is by far the best they have ever used. Samples can be seen at above address, or forwarded on application free of charge.

GISHURST COMPOUND, used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Blights. 1 to 4 ounces to the gallon of soft-water: 4 to 16 ounces as winter dressing for Vines and Orchard-house Trees; and in latter from the cake against American Blight. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boats dry and soft on wet ground. See list of Agents from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

## FAWKES' SLOW-COMBUSTION HEATING APPARATUS.

Most Efficient and Cheapest in Existence. Requires no sunk stovehole and no brick setting. Will last all night without attention. Will burn house cinders, therefore costs next to nothing for fuel. Any one can fix it. A domestic servant can stoke it. Complete Apparatus from £4 12s.

SUCCESS GUARANTEED.

Enormous numbers in use all over the country. Only Slow Combustion Apparatus of the kind.

CAUTION. Beware of inefficient incomplete Apparatus, which will not last all night.

Full particulars and Prices of every sized Apparatus, and numerous Testimonials for last five seasons, showing enormous success, post-free on application.

## SPHINCTER GRIP GARDEN HOSE

The Sphincter Grip Spring Steel Galvanised Armoured Hose is the most valuable improvement in Hose since 1840. Its lasting qualities are ten times greater than any Hose not armoured.

Its complete success has caused some parties to infringe the Patents owned and controlled solely by us; and we therefore notify all such that the making, vending, or use of any armoured wire-wound Hose not of our manufacture is an infringement of one or more of our several Patents, any violation of which will be promptly prosecuted. Brass plates set between the Hose and wire denote our Manufacture and the Patents.

### TESTIMONIALS.

MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1888.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 8 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly,

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5,000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

MESSRS. THOS. GREEN AND SON, LTD., LEEDS.

(Signed) G. W. BASHFORD.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

**COW and POULTRYMAN**; would assist in Garden.—Age 22; nine years in large Dairy.—For particulars, apply, The GARDENER, Springfield, Dartford, Kent.

**HOLLOWAY'S OINTMENT and PILLS**.—Help Under Suffering.—When a multitude are afflicted with complaints which, short of endangering life, bring almost every other personal trouble, it would be well were the knowledge of these remedies widely disseminated. No disease which will afflict the human system is more inescapable or more difficult to cure than skin diseases, whether superficial sores or deep ulcerations. Holloway's Ointment has proved itself a ready remedy for these maladies; it at once assuages pain, cleans the wound, and works out a sound and lasting cure more certainly and more rapidly than any other application. In old affections, debilitated habits and constitutional ailments Holloway's should be taken to increase the salutary effect of his ointment.

### MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus.

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, building the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen wanted in any part of the country. Plans and Estimates free on application.

# LILIUM NEPALENSE. CYPRIPEDIUM BELLATULUM. CYPRIPEDIUM LAWRENCEANUM.

**MR. J. C. STEVENS will SELL by AUCTION,**  
AT HIS  
**GREAT ROOMS, 38, KING STREET, COVENT GARDEN, W.C.,**

*On THURSDAY, September 27,*

By order of Messrs. HUGH LOW & Co., growing plants of

**LILIUM NEPALENSE**—a grand species, to which a First-class Certificate was awarded by the Floral Committee of the Royal Horticultural Society, on September 11, and which may be considered one of the very finest and most distinct New Plants of recent introduction.

Upwards of a dozen flowers were counted on an old stem in its native habitat, where the temperature falls many degrees below freezing point. It is described in the various Gardening Papers of the 15th inst., and a plant in flower will be on view.

At the same time will be offered **600 CYPRIPEDIUM LAWRENCEANUM**—grand plants, in the finest possible condition, recently imported: the leaves are beautiful in the extreme, and there is every probability of fine varieties being amongst them, as from an importation from the same locality, sent home by the same collector, *Cypripedium Heyenianum* appeared. Fine plants of **CYPRIPEDIUM BELLATULUM**, amongst them fine specimens; **C. SANDERIANUM** and **C. NIVEUM**.

*On view morning of Sale, and Catalogues had.*

**WANTED TO RENT**, a small **FLORIST'S BUSINESS**, in or near a Town.  
Full particulars to A. & B. New Cottages, Withycombe, Exmouth.

**FOR SALE, a NURSERY, SEED, and CUT FLOWER BUSINESS**, situated in a rising town in Yorkshire. The Nursery is 6 acres, and is well stocked with a first-class General Nursery Stock. There are 4 Plant Houses and a number of Pits, all well suited for Market work. The shop trade is mostly cash, and satisfactory reasons will be given or shown why disposing. This is a rare opportunity for a retiring Gardener.—Apply to S. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**To Market Gardeners, Florists, Nurserymen, &c. HAMPTON-ON-THAMES.**

**FOR SALE**, choice **FREEHOLD LAND**, in Acre Plots, suitable for above. Rich Garden Soil with gravel and sand sub-soil. The land is considered by the Trade the finest near London for Grapes and all other Market Products. Apply, **SECRETARY**, Estates Investment and Villa Farm Company, Estate Office, Tangley Park, Hampton-on-Thames.

**To Florists, Nurserymen, and Others.**  
**TO BE SOLD**, by Tender, the **LEASE and BUSINESS of a FLORIST and SEEDSMAN**, for some years past carried on by Mr. J. C. Hawke, at Newington near Sittingbourne. The Premises include a 6-roomed Dwelling house, 7 capital Greenhouses, about 50 by 11 feet; and a 2-stall Stable. Held under Lease, of which 17 years is unexpired, at the nominal rental of £18 per annum.  
Sealed Tenders to be delivered at Mr. HEWETT, Newington, Kent; or to Mr. F. CLEAVER, 48, West Street, Sittingbourne, not later than Tuesday, October 2, and of whom full particulars may be obtained.

**FOR SALE, FREEHOLD BUILDING** LAND, suitable for Fruit Growing and Garden Purposes, adjoining station at Ashford, Middlesex, near Richmond and Twickenham. 20 ft. frontage, 120 ft. deep; £20 a plot, or 6s. per month. Water, gas, roads made—free conveyance—plans. Mr. FIELD, 3, Bucklersbury, E.C.

**TO BE SOLD**, or would be **LET**, a **NURSERY**, 2 acres of Ground, Glasshouses, and small comfortable House. Between Putney and Wandsworth. Fifty years' lease at £50 a year. Suitable for a London Seedsmen. Apply to Mr. FRED W. GLAZIER, 1, Park Side, Hyde Park Corner, W.

**South of England.**

**LARGE GARDEN**, 20 Acres, with Twenty Greenhouses and Vineries. £7000 has been spent on the property. Seven years' lease. Two Cottages inclusive. £150 a year. ELDRIDGE, Portsmouth.

**TO LET**, a Small **JOBGING and FLORIST'S NURSERY**, consisting of 4 Houses and several Pits, excellently situated, in most fashionable part of Leicester. An advantageous opportunity for an energetic and enterprising man. Apply, **HARRISON AND SONS**, Royal Midland Seed Establishment, Leicester.

**TO LET, VINERY and GLASSHOUSE** about 100 yards long, 8 yards wide, 14 feet wide. 150 Vines.—Address, Cliffe Cottage, Idle, near Bradford.

**Surrey.**

**TO BE LET**, on moderate terms, about One Acre of **GROUND**, with numerous Glass Houses. Full particulars and terms of Messrs. PROTHEROE AND MORRIS, Auctioneers, 67 and 68, Chancery Lane, E.C.

**WM. OUTBUSH and SON** (Limited), Nurserymen and Seed Merchants, Highgate Nurseries, N.

completed the theory of the flower. In the following century Morison first raised Ferns from spores, Lindsay detected the Fern prothallus, Ray laid the foundations of a natural classification, Hales discovered root-pressure, and Priestley the absorption of carbon dioxide and the evolution of oxygen by plants. In the early part of the present one we have Knight's discovery of the true cause of geotropism, Daubeny's of the effect upon the processes of plant-life of rays of light of different refrangibility; and finally, the first description of the cell-nucleus by R. Brown. I have singled out these discoveries as striking landmarks, the starting-points of important developments of the subject. It is enough for my purpose to show that we have always had an important school of botany in England, which has contributed at least its share to the general development of the science.

#### SYSTEMATIC BOTANY.

"As the head of one of the great national establishments of the country devoted to the cultivation of systematic botany, I need hardly apologise for devoting a few words to the present position of that branch of the science. Of its fundamental importance I have myself no manner of doubt. But as my judgment may seem in such a matter not wholly free from bias, I may fortify myself with an opinion which can hardly be minimised in that way. The distinguished chemist, Professor Lothar Meyer, perhaps the most brilliant worker in the field of theoretical chemistry, finds himself, like the systematic botanist, obliged to defend the position of descriptive science. And he draws his strongest argument from biology. 'The physiology of plants and animals,' he tells us, 'requires systematic botany and zoology, together with the anatomy of the two kingdoms: each speculative science requires a rich and well-ordered material, if it is not to lose itself in empty and fruitless fantasies.' No one, of course, supposes that the accumulation of plant specimens in herbaria is the mere outcome of a passion for accumulating. But to do good systematic work requires high qualities of exactitude, patience, and judgment. As I had occasion to show at the Linnean Centenary, the world is hardly sensible of the influence which the study of the subject has had on its affairs. The school of Jeremy Bentham has left an indelible mark on the social and legislative progress of our own time. Mill tells us that 'the proper arrangement of a code of laws depends on the same scientific conditions as the classifications in natural history; nor could there be added, 'be a better preparatory discipline for that important function than the principles of a natural arrangement, not only in the abstract, but in their actual application to the class of phenomena for which they were first elaborated, and which are still the best school for learning their use.' He further tells us that of this Jeremy Bentham was perfectly aware, and that his *Fragment on Government* contains clear and just views on the meaning of a natural arrangement which reflect directly the influence of Linnaeus and Jussieu. Mill himself possessed a competent knowledge of systematic botany, and therefore was well able to judge of its intellectual value. For my part, I do not doubt that precisely the same qualifications of mind which made Jeremy Bentham a great jurist enabled his nephew to attain the eminence he reached as a botanist. As a mere matter of mental gymnastics, taxonomic science will hold its own with any pursuit. And, of course, while I say of botany is no less true of other branches of natural history. Mr. Darwin devoted eight or nine years to the systematic study of the Cirripedia. 'No one,' he himself tells us, 'has a right to examine the question of species who has not minutely described many.' And Mr. Huxley has pointed out, in the admirable memoir of Mr. Darwin which he has prepared for the Royal Society, that the acquirement of an intimate and practical knowledge of the process of species-making '... was of no less importance to the author of the *Origin of Species* than was the bearing of the Cirripede work upon the principles of a natural classification.'

"At present, undoubtedly, the younger generation of botanists show a disposition to turn aside to those fields in which more brilliant and more immediate result can be attained. Their neglect of systematic botany brings to some extent its own Nemesis. A first principle of systematic botany is that a name should denote a definite and ascertainable species of plant. But in physiological literature you will find

that the importance of this is entirely overlooked. Names are employed which are either not to be found in the books, or they are altogether misapplied. But if proper precautions be taken to ascertain the accurate botanical name of a plant, no botanist throughout the civilised world is at a loss to identify it. But precision in nomenclature is only the necessary apparatus of the subject. The data of systematic botany, when properly discussed, lend themselves to very important generalisations.

#### GEOGRAPHICAL DISTRIBUTION.

"Perhaps those which are yielded by the study of geographical distribution are of the most general interest. The mantle of vegetation which covers the surface of the earth, if only we could rightly unravel its texture, would tell us a good deal about geological history. The study of geographical distribution, rightly handled, affords an independent line of attack upon the problem of the past distribution of land and sea. Here, however, we are embarrassed by the enormous amount of work which has yet to be accomplished. And unfortunately this is not of a kind which can be indefinitely postponed. The old terrestrial order is fast passing away before our eyes. Everywhere the primitive vegetation is disappearing as more and more of the earth's surface is brought into cultivation, or, at any rate, denuded of its forests. A good deal, however, has been done. We owe to the indomitable industry of Mr. Benthall and of Sir Ferdinand Mueller a comprehensive flora of Australia, the first large area of the earth's surface of which the vegetation has been completely worked out. Sir Joseph Hooker, in his retirement, has pushed on within sight of completion the enormous work of describing so much of the vast Indo-Malayan flora as is comprised within British possessions. To the Dutch botanists we owe a tolerably complete account of the Malayan flora proper. But New Guinea still remains botanically a *terra incognita*, and till within the last year or two the flora of China has been an absolute blank to us. A committee of the British Association has, with the aid of a small grant of money, taken in hand the task of gathering up the scanty data which are available in herbaria and elsewhere. This has stimulated European residents in China to collect more material, and the fine collections which are now being rapidly poured in upon us will, if they do not overwhelm us by their very magnitude, go a long way in supplying data for a tentative discussion of the relations of the Chinese flora to that of the rest of Asia. I do not doubt that this will in turn explain a good deal that is anomalous in the distribution of plants in India. The work of the committee has been practically limited to Central and Eastern China. From the west, in Yunnan, the French botanists have received even more surprising collections, and these supplement our own work in the most fortunate manner. I have only to add for Asia Boissier's *Flora Orientalis*, which practically includes the Mediterranean basin. But I must not omit the invaluable report of Brigade-Surgeon Aitchison on the collections made by him during the Afghan Delimitation Expedition. This has given an important insight into the vegetation of a region which had never previously been adequately examined. Nor must I forget the recent publication of the masterly report by Professor Bayley-Balfour on the plants collected by himself and Schweinfurth in Socotra, an island with which the ancient Egyptians traded, but the singularly anomalous flora of which was almost wholly unknown up to our time. The flora of Africa has been at present but imperfectly worked up, but the material have been so far discussed as to afford a tolerably correct theory of its relations. The harvest from Mr. Johnston's expedition to Kilima-Njaro was not as rich as might have been hoped. Still it was sufficient to confirm the conclusions at which Sir Joseph Hooker had arrived, on very slender data, as to the relations of the high-level vegetation of Africa generally. The flora of Madagascar, investigated by Mr. Baker, is perhaps at the moment the most interesting problem which Africa presents to the botanists. The flora as a whole presents a large proportion of endemic genera and species, pointing to isolation from a very ancient date. The tropical element is, however, closely allied to that of Tropical Africa and of the Mascarene Islands, and there is a small infusion of Asiatic types which do not extend to Africa. The high-level flora, on the other hand, exhibits an even closer affinity with the temperate flora, the ruins of which are scattered over the mountainous regions of Central Africa, and which

survives in its greatest concentration at the Cape. The American botanists at Harvard are still systematically carrying on the work of Torrey and Gray in the elaboration of the flora of Northern America. The Russians are, on their part, continually adding to our knowledge of the flora of Northern and Central Asia. The whole flora of the north temperate zone can only be regarded substantially as one. The identity diminishes southwards, and increases in the case of the arctic and alpine regions. A collection of plants brought up from high levels in Corea by Mr. James might, as regards a large proportion of the species, have been gathered on one of our own Scotch hills. We owe to the munificence of two English men of science the organisation of an extensive examination of the flora and fauna of Central America and the publication of the results. I am happy to say that the botanical portion, which has been elaborated at Kew, is all but finished. In South America I must content myself with referring to the great *Flora Brasiliensis*, commenced by Martius half a century ago, and still slowly progressing under the editorship of Professor Urban at Berlin. The travels of Mr. Ball in South America have led him to the detection of some very interesting problems. The enormous pluvial denudation of the ancient portions of the continent has led to the gradual blending of the flora of different levels with sufficient slowness to permit of adaptive changes in the process. The tropical flora of Brazil, therefore, presents an admixture of modified temperate types, which gives to the whole a peculiar character not met with to the same degree in the tropics of the whole world. On the other hand, the comparatively recent elevation of the southern portion of the continent accounts, in Mr. Ball's eyes, for the singular poverty of its flora, which we may regard indeed as still in progress of development.

"The botany of the Challenger Expedition which was also elaborated at Kew, brought for the first time into one view all the available facts as to the floras of the older oceanic islands. To this was added a discussion of the origin of the more recent floras of the islands of the Western Pacific, based upon material carefully collected by Professor Mosely and supplemented by the notes and specimens accumulated with much judgment by Dr. Guppy. For the first time we were enabled to get some idea how a tropical island was furnished with plants, and to discriminate the littoral element due to the action of oceanic currents from the interior forest, almost wholly due to frugivorous birds. The recent examination of Christmas Island by the English Admiralty has shown the process of island flora-making in another stage. The plants collected there, I may say, might be expected to be closely allied to those of Java. But the effect of isolation has begun to tell; and I learn from my colleague, Professor Oliver, that the plants from Christmas Island cannot be for the most part exactly matched with their congeners from Java, but yet do not differ sufficiently to be specifically distinguished. We have here, therefore, it appears to me, a manifest case of nascent species.

#### CLASSIFICATION.

"The central problem of systematic botany is to perfect a natural classification. Such a classification, to be perfect, must be the ultimate generalisation of every scrap of knowledge which we can bring to bear upon the study of plant affinity. In the higher plants experience has shown that we can obtain results which are sufficiently accurate for the present, without carrying our structural analysis very far. Yet even here, the correct relations of the gymnosperms would never have been ascertained without patient and minute microscopic study of the reproductive processes. Upon these, indeed, the correct classification of the vascular cryptogams wholly depends, and generally, as we descend in the scale, external morphology becomes more and more insecure as a guide, and a thorough knowledge of the minute structure and life history of each organism becomes indispensable to anything like a correct determination of its taxonomic position. The marvellous theory of the true nature of lichens would never have been ascertained by the ordinary methods of examination which were held to be sufficient by lichenologists. The final form of every natural classification, therefore, I have no doubt that the general principles I have laid down are equally true in the field of zoology—must be to approximate to the order of descent. For the theory of descent became an irresistible induction as soon as the idea of a natural classification had been firmly grasped. This leads me to

touch on the great theory which we owe to Mr. Darwin. That theory, I need hardly say, was not merely a theory of descent. This had suggested itself to naturalists in the way I have indicated long before. What Mr. Darwin did was to show how by perfectly natural causes the separation of living organisms into races which at once resemble and yet differ from one another so profoundly came about. Heredity explains the resemblance; Mr. Darwin's great discovery was that variation worked upon by natural selection explained the difference. That explanation seems to me to gather strength every day, and to continually reveal itself as a more and more efficient solvent of the problems which present themselves to the student of natural history. At the same time I am far from claiming for it the authority of a scientific creed, or even the degree of certainty which is possessed by some of the laws of astronomy. I only affirm that as a theory it has proved itself a potent and invaluable instrument of research."

(To be continued.)

## NEW OR NOTEWORTHY PLANTS.

CATTLEYA KRAMERIANA  $\times$ , *hyb. nat. nov.*

It is this is not showy, it is decidedly lovely, notwithstanding its rather narrow, pale rose-coloured sepals and petals, the sepals having a thickened green apex. It is the lip that is so beautiful. The side lacinia is semi-oblong, half-heart-shaped at the base and apex, with a rose-coloured border, and the remainder, excepting the discoidal area, of the lightest purple. Mid-lacinia semi-oblong, emarginate, toothed, wavy, with two discoidal areas of the deepest mauve-purple. The remaining part is white. There are five rough central keels, the outer ones with exsiliant triangles, five to seven in number. All these keels and triangles have a certain hue of brick-red. Column very strong, trigonous, curved, with a three-lobed anther-bed. Mid-lobe pistillar, side lobes with two or three teeth, all deep purple. Broken purple lines on the sides of the column, seven in front under the fovea, partly elevated in keels at the base, whose anterior surface is sulphur-coloured. Anther white. Pollinaria four, regularly Cattleoid. I have a two-flowered peduncle with a rather thin withered sheath.

Mr. Franz Kramer, the leading gardener of Herr Rücker-Jenisch, at Kleinfottbek, imported it from Brazil as a hybrid between *Cattleya intermedia* and *Forbesii*. I have been kindly favoured with a stem that is more than a foot in length, the upper part nearly half an inch in diameter. There the longer superior joints are furrowed with blunt ribs. The three very coriaceous leaves are minutely crenulate at the reflexed margin, 6 inches long by  $2\frac{1}{2}$  wide. The plant resembles a very tall specimen of *Cattleya intermedia*. The flower resembles the flowers of both species. It is a great satisfaction to dedicate this lovely plant to Mr. Franz Kramer, the persevering and successful head gardener of the park and gardens of Kleinfottbek, which earned their reputation by the work of Herr Senator Jenisch and his head-gardener, Mr. Kramer, sen. *H. G. Rehb. f.*

MASDEVALLIA PUNCTATA, *Rolfe, n. sp.*

This is an interesting novelty, which has been flowering in the Kew collection for the past few weeks, and which belongs to that small group in which the lip and lateral sepals are uppermost, and the odd sepal inferior. It is more nearly allied to *M. swartzii*, *Rehb. f.*, than to any other, having a descending peduncle and a succession of flowers, but only one developed at once. The present species, however, has decidedly larger flowers, which bear a remarkable resemblance to the head of a bison, owing to the shape and curvature of the lateral sepals; also a quite different colour. The ground colour of most of the flower is a light or semi-translucent greenish tint, but heavily spotted with dark purple-brown, these spots being almost or quite suffused towards the base of the flower. The lateral sepals, however, are markedly different, the

ground colour here being opaque yellow-ochre, inclining slightly towards greenish, and densely covered with minute dusky spots. These are far smaller and far more numerous than those on the rest of the flower, besides being quite different in colour, and impart to the flower a very distinct character.

The plant was presented to Kew in the early part of the present year by Messrs. Backhouse & Sons, of York, though I do not know the precise locality from whence it was obtained, and can only surmise that it came from the Andes of, or near, New Grenada. It grows in a dense tuft, about 4 inches high. The leaves are lanceolate, acute, 7-9 lines broad, light green, narrowing into a petiole about 1 inch long. Peduncle slender, descending, about  $2\frac{1}{2}$  inches long. Odd sepal ovate, strongly concave, three-keeled, the central one being very prominent, tail about  $\frac{1}{2}$  inch long, and about equalling the limb. Lateral sepals connate, 3 lines, strongly decurving for about 5 lines, then abruptly terminating in slender tails about  $1\frac{1}{2}$  lines long. At the point of divergence of the lateral sepals is a very distinct narrow groove dividing the two; here they measure about  $2\frac{1}{2}$  lines across, and at the place where they suddenly narrow into the tails, about 1 line. Petals 2- $2\frac{1}{2}$  lines long, oblique, narrowed below, acute above, with a pair of nerves somewhat keeled outside; yellow above, spotted, or almost suffused with dark purple below. Lip as in the section generally. Column slender, narrowly winged above, tridentate, deep purple-brown, green at extreme apex. Pollen masses two, as in genus. *R. A. Rolfe.*

## NURSERY NOTES.

### ORCHIDS AT MR. CYPHER'S.

Quite recently I had an opportunity of taking notes of some of the plants growing in Mr. Cypher's nurseries at Cheltenham, which may, perhaps, interest some at least of your many readers. To be enabled to see growing many fine plants in such unwonted vigour as I saw them is not an unpleasant thing; indeed, the opportunity of taking a walk through this far-famed plant growing establishment is of more than passing interest to me in itself, inasmuch as I am able to remember the spot as a green field, and have watched its continuous development to the present time.

When first it became a nursery a long straight drive ran through it, having borders for specimens on either side of Roses, Conifers, and shrubs, together with some good old-fashioned perennials. All this, however, has departed, but not dispensed with, and plant-houses of all descriptions occupy their place. The Roses and other things are taken across the road to a plot of valuable land of several acres, where they receive greater attention than ever. But this has little to do with Orchids, it may be said; and yet it has a good deal, for the advent of the Orchids was actually the occasion of turning out the other plants, and now the Orchids are an important feature of the nursery. It is a sight worth seeing to look into the Cattleya-house alone, and inspect the fine specimens of this and that rarity which one is not wont to see in such perfection. The early part of September is perhaps not the gayest time for *Lælia*s and *Cattleya*s, but still it afforded ample opportunity for speculation on the rich harvest of bloom which will speedily follow. *Lælia anceps* was already showing in numbers, and many fine forms of *Cattleya Gaskelliana* were in bloom. In one pot were two very distinct forms, clearly the result of natural hybridisation. Mr. Cypher informed me that they were potted as received, and it was evident by the manner in which they had grown together that they had shared each other's company from the first; the one is very light, and the other very deeply coloured, the latter being a decided acquisition, consequently they are destined at some time to be parted. *Odontoglossum grande*, always a favourite, was in flower in several houses.

The nursery is famous for *Dendrobies*, and among the more conspicuous plants at the present season may be mentioned D. Jamesoni, the continuous flowering D. Dearei, whose pure white flowers are remarkable for their durability; D. Ainsworthii makes remarkable progress here, and the stout, solid, short-jointed growths form good proof of proper methods of culture. Mr. Cypher has been very fortunate in raising a stock of this hybrid from division of the odd pseudobulbs, which he cut into lengths containing a couple of joints, and planted in shallow pans of sphagnum moss, sharp sand, fine charcoal or small crocks, and a little peat. For some time the cuttings are kept moderately cool and are only watered occasionally, and when the joints exhibit signs of activity a warmer temperature and more moisture are accorded them. Established plants delight in a position near the glass, with plenty of heat and moisture while in full growth; the fragrant flowers of this are always welcome in winter time. A fresh importation of *Dendrobium McCarthiae*, made direct from India last winter, has made a good start, and numerous new growths 18 or 20 inches long have been made. D. Wardianum showed a great number of growths, some being upwards of 3 feet in length. *Masdevallias* and *Lycastes* are also in large numbers. Among the former Mr. Harryana was conspicuous by reason of its richly coloured flowers.

The latter group will make a fine display at a later date. Among other Orchids in flower were *Cypripedium Lawrenceanum* and C. Parishii, *Odontoglossum Roezlii*, *Epidendrum prismatocarpum*, *Mormodes luxatum eburneum*, and many more. These, however, are but a few of what may be seen in house after house filled with choice things. Besides Orchids there is a grand collection of Heaths and hard-wooded subjects. *J.*

### LETTCES AT READING.

Whilst Lettuces were this cold season a drug in the market, and of late often absolutely unsaleable at any price, it has been somewhat remarkable that complaints of early "bolting off" to seed have been common; and, though usually esteemed a cool-weather plant, yet it is possible that so much coolness of temperature and soil promoted this rapid bolting. It is by no means improbable also that in some cases seed is saved from stocks which bolt readily, hence the hereditary taint; but there are stocks so good that they cannot be induced to bolt so soon as may be desirable—in fact, some cannot be induced to seed in this country freely from the earliest of spring-sown plants, and those who grow Lettuces for cutting only, and not for seed production, find the long-standing strains to be of great value.

When recently I was permitted to inspect the extensive trial-grounds of Messrs. Sutton & Sons, specially noticeable were the Cos and Cabbage Lettuces, and I must say that several of the strains at Reading were very good, the Cabbage Lettuces especially showing remarkable dimensions, although on ordinary field soil, and at the same time they were as solid and firm as they possibly could be. Of the Cos forms, a huge one, and a very solid-heating, handsome one, is the Reading Mammoth White. Those familiar with Ivery's Nonsuch, know that it long enjoyed the reputation of being the tallest and finest of all the Cos Lettuces, very distinct in form and leafage, but rarely standing long, and as seldom producing a solid heart. The Mammoth looks as if it were the product of a cross between the Nonsuch and a fine form of Paris White. It is tall, handsome, massive, solid-hearted, and stands well. Without exception it is the finest of all show Lettuces. The Superb White Cos is a grand stock of the Paris White, but having hearts so rounded, solid, and massive, that anyone might almost sit upon them without breaking them. This stands for weeks before bolting to seed. Sutton's Whiteheart is well named, as having huge solid white hearts set in a few deep-green leaves, and

is also a splendid summer Lettuce, and Sutton's Winter White, which has proved quite hardy in the trial grounds, should make a first-rate variety for autumn planting, standing in a seedbed for spring planting.

Turning to Cabbage Lettuces, so tempting looking and so sweet and crisp, the little Commodore must stand out as invaluable for close planting on warm borders, and for the earliest use. All the Year Round had soon bolted, whilst the little Commodore was still as hard as a nut. Sutton's Standwell, fitly named, is a very large, solid, white-hearted form, big as skittle-balls and almost as firm. A brown-tinted form is named Brown Standwell, and was even larger than the preceding, and as solid. Sutton's Favourite, a perfect giant amongst Cabbage Lettuces, resembles a white Savoy Cabbage in being curly, yet so very firm and solid; whilst even larger seemed to be Sutton's Giant, purple-tinted, and a grand solid-hearted variety.

These are but a few selections out of a large trial, and illustrate the care and enterprise of high-class seedsmen tend to the production of high-class vegetables. *A. D.*

#### CLEMATIS AT HUNTINGDON.

If one desired to gain anything like an accurate idea of the extent to which the Clematis is grown in the present day, it might be realised by consulting those in the trade who grow largely to supply their brother nurserymen. It appears that certain of the trade make a leading speciality of the Clematis, and by propagating a selection of varieties in large quantities they are able to supply others in the trade as cheaply at least as they could propagate for themselves on a limited scale. One of the firms who produce Clematis to a large extent is that of Messrs. Wood & Ingram, of Huntingdon.

It is probably pretty widely known that Clematis are propagated by grafting upon the roots of some favourite stock, and that this is done mainly in spring. It is work requiring careful manipulation, and also suitable propagating-houses, so that the process may go on rapidly. As to the most suitable stocks for grafting, that is to some extent a matter upon which the trade is apt to maintain a reserve. One firm which grows largely uses two stocks, and it seems some care is necessary, for the Clematis is subject to a disease that it is supposed originates in the stock, and great discrimination is therefore necessary to select these clean and healthy.

Our lists of Clematis are now somewhat extensive—even if they are confined to what may be termed popular leading varieties. Messrs. Wood & Ingram's list comprises some sixty varieties, and of these about twenty may be said to be in the largest demand, and a few popular varieties, such as Jackmanni, have to be produced in extra quantities. Of Jackmanni, Messrs. Wood & Ingram have this season propagated some 5000 plants.

A list of Clematis, which has no classification into sections is at best a bewildering document. Unless one is pretty familiar with the varieties, who is to tell which are the spring bloomers that flower on the old wood of the previous year, and which the summer-blooming types which bloom upon the summer shoots of the same year? The sixty or so varieties grown by Messrs. Wood & Ingram can be divided into five distinct sections—the lanuginosa, the Jackmanni, the florida, the patens, and the viticella. The lanuginosa group has gained in number in recent years by the addition of many fine varieties. They flower upon the wood of the current year, and the successional summer growths should be trained in so as to secure the later crops of blossoms, the habit in the race being to throw out a sprinkling of flowers at intervals till the frosts come to arrest further growth. When they have to cover a limited space or are employed as pyramids the plants should be annually pruned down to about 3 feet from the ground, so that the base may not become naked by being devoid of foliage. Of this section the best varieties are:—Alba magna, white; Blue Gem, pale blue; Enchantress, double, white flushed with rose; Fairy Queen, pale

flesh, with pink bar; Henry, creamy-white, said to be a very hardy variety; Imperatrice Eugénie, white; Lady Caroline Nevill, French-white, with mauve bars; Lady Rosamond, silvery-grey; lanuginosa and its varieties, candida and nivea; Lawsoniana, rosy-purple—a very vigorous grower; Lord Nevill, bright blue; Louis van Houtte, bluish-purple; Madame van Houtte, white; Mdlle. Torriana, bright rose; Mrs. Chomondeley, lavender, tipped with purple; Mrs. Hope, satiny-mauve; Princess of Wales, deep bluish-mauve; purpurea elegans, deep violet-purple; Robert Hanbury, bluish-lilac; Sir Garnet Wolsley, bluish ground, with plum-red bar; Symeana, delicate lavender-blue; The President, purple, suffused with claret; Venus Victrix, delicate lavender—a double variety; William Kennett, deep lavender; and Willisoni, shaded pale lavender.

For general usefulness, hardiness, floriferousness, and great decorative effect, the Jackmanni section of the Clematis is the most valuable, for the plants in the late summer and autumn months literally become masses of blossoms successively and continuously renewed. They should be pruned back hard in early spring, as well-established plants throw out large numbers of strong leading shoots that bloom with marvellous freedom. The leading varieties, and the most useful of this section are:—ascotensis, azure-blue; Beauty of Worcester, a variety that bears both double and single flowers, the colour a very pleasing bluish-violet, a fine and distinct new variety; Gipsy Queen, rich bright dark velvety-purple—late flowering; Jackmanni, Jackmanni alba, and Jackmanni superba, the flowers of the latter large and very fine in form; Madame Grange, crimson-violet, tinted with red—a fine and distinct variety; President Grévy, bluish-purple; Star of India, reddish-plum; Victoria, deep reddish-mauve; and velutina, dark purple.

The florida section, the forerunner being a Japanese species, is a much smaller group, but one which contains only summer bloomers, flowering from the old or ripened wood; it is therefore obvious that if the plants were pruned back as recommended in the case of the lanuginosa and Jackmanni types, they would not flower, and therefore what is required in the way of pruning is, that the decayed wood be simply thinned out, the ripened shoots made the previous summer being left for flowering. The varieties forming this section are well adapted for planting against conservatory walls, or in corridors, and if on walls it should be where their blooms are sheltered from late spring frosts, which occasionally injure them. The leading varieties are:—Belle of Woking, silvery-grey, double; Candidissima flore-pleno, white; Countess of Lovelace, bluish-lilac, double; Duchess of Edinburgh, white, double; Fortunée, white, double; John Gould Veitch, lavender-blue, double; Lucie Lemoine, white, double; Mr. George Jackman, satiny-white; and Proteus, purplish-rose, large and double.

The patens section is represented by a much larger number of varieties, and, like the florida type, flowers from the old or ripened wood, and generally rather earlier in the year, hence they are known as spring bloomers. The most popular varieties appear to be Albert Victor, deep lavender; Duke of Edinburgh, deep violet-purple; Lord Londesborough, deep mauve; Miss Bateman, white; Miss Crawshaw, Solferino-pink, a very distinct and pleasing variety; Mr. S. C. Baker, French-white with claret bars; Sophia, mauve; and Standishii, violet-blue.

Lastly comes the viticella section, and they are also summer and autumn bloomers, flowering successively, in profuse masses, on summer shoots, but not so continuously as in the case of the Jackmanni type. Of this there are a few fine varieties, such as Earl of Beaconsfield, rich royal purple; Lady Bovill, greyish blue; and viticella rubra grandiflora, bright claret-red, small-flowered, but very distinct.

Respecting the culture of the Clematis, it can be said it is a very accommodating plant, growing in any good garden soil provided it is enriched. A soddened soil is unsuitable, and that in which the plants are growing should be so open as to allow of

water freely passing away. Chalk or lime mixed with a rich light loam, is found to suit the Clematis well. A good mulching of short manure should be given in spring, and this lightly forked in in autumn. Cow-dung on light, and leaf-mould on heavier soils can be used with great advantage.

A list of twenty fine varieties of the Clematis will be found in the following:—Alba magna (L.), Beauty of Worcester (J.), Belle of Woking (F.), Countess of Lovelace (F.), Duchess of Edinburgh (F.), Enchantress (L.), Fairy Queen (L.), Gipsy Queen (J.), Henry (L.), Jackmanni superba (J.), lanuginosa (L.), Lawsoniana (L.), Lord Nevill (L.), Madame Grange (J.), Mrs. George Jackman (P.), Princess of Wales (L.), purpurea elegans (L.), Symeana (L.), Venus Victrix (L.), and William Kennett (L.) The letter placed after each name denotes the section to which each variety belongs. *R. D.*

#### CHIRONIA PEDUNCULARIS.

THE Chironias are pretty greenhouse plants, easy to cultivate, free flowering, and they last in flower several months. They are rarely met with in gardens nowadays, having disappeared along with numerous hard-wooded greenhouse plants with which they used to be commonly cultivated. *C. peduncularis* (fig. 42) is one of the best of them. It was cultivated in England many years ago under the name of *Exacum*, to which it bears a close resemblance. It is a native of the Cape, where the genus is abundantly represented, especially near the sea. The species under notice was found by me in abundance on marshy ground, within reach of sea-spray near the port of East London. A few pods of seed were found and brought to Kew in the spring of last year, where the plants have this year been much admired. Several examples were exhibited in the spring at one of the Royal Horticultural Society's meetings, and these same plants remained long in bloom. They are about 2 feet high, freely branched, the leaves bright green, and the flowers a soft rosy-purple. This species is well worth growing for the conservatory and cold greenhouse. It seeds very freely. *W. W.*

#### GENTIANA ACAULIS AND ITS ALLIES.

UNDER this name may be included several cultivated forms which have been classed and adopted as species by certain botanists. As this confusion may give rise to difficulties (especially among amateurs who may desire to cultivate them), it will not be superfluous to pass them in review.

Those who botanise in our mountains are struck by the difference seen in the leaves and flowers of different plants of the acaulis section. My friend, Mr. Scott Wilson, with whom I botanised on the slopes of Filly, remarked this to me, and said, how greatly the plants around us differed from *G. acaulis* as grown in his father's garden at Weybridge. As I had already read the note by Mr. Perier, of La Battue, on the same subject (*Bulletin de l'Association pour la Protection des Plantes*, No. 2), I decided to work out the matter. Mr. Perier procured some seed for me, and I collected some myself, and was easily convinced that marked differences do exist.

There is evidently one variety of *G. acaulis* which, having been cultivated for so long a time in English and Dutch gardens, has become modified and acclimatised; this is what is called in English gardens the "Gentianella." This plant produces offsets freely; its foliage is more shining, and is harder than in the type. It is really a garden species, without any exact natural counterpart of the Alps, for the most part difficult to cultivate when transplanted from the mountains to the plains. In order to introduce them into gardens recourse must be had to acclimatisation by seed, which are easily procured, but are of slow germination. I have given particulars as to the method of raising them from seed in former numbers of the *Gardeners' Chronicle*.

The different forms of the *acaulis* group are considered to be species, and consequently the old original type of *acaulis* only exists in an historical sense. These forms are maintained in the garden here by propagation and by seeds.

*Gentiana alpina* of the fields, &c., must be excluded from these notes, as I have never been able to obtain seeds of the true form. It is more rare than it is generally thought to be, but I hope to discover it this autumn and collect seeds.

The species I have grown from seed are *Gentiana Clusii*, *G. angustifolia*, and *G. Kochiana*.

erect, of an azure-blue colour with five bright green spots in the throat. It is the most beautiful species, and also the most easy to cultivate. A sowing made in 1886 produced flowers last spring, whereas with other species three or four years elapse before flowering. *G. angustifolia* is a native of the limestone mountains of the La Grande Chartreuse region between Chambéry and Grenoble, and consequently requires a limestone soil.

*G. Kochiana* has large, very broad leaves, of a moss-green colour, which spread out on the soil. It is the most curious *Gentian*, and its foliage is the richest,

A fifth form of *G. acaulis* has been found in the mountains of Bosnia, and is described by Dr. Günther Ritter von Beck in the *Flora of Bosnia* (Abhandlung des K. K. Natur. Hofmuseums in Wien).

Of all these species it is very certain that *G. angustifolia* is the best to cultivate, being the prettiest, and the one most easily grown (excepting the English *Gentianella*). It frequently flowers again in the autumn, and is covered with its fine bell-shaped flowers in the spring, and does not suffer from our relatively dry atmosphere. *H. Correvon, Jardin Alpin d'Acclimatation à Genève.*

## THE CHEMISTRY OF VEGETATION, IN REFERENCE TO THE GROWTH OF THE POTATO.

(Continued from p. 208.)

BOUSSINGAULT.—When once this kind of investigation was fairly "set going" a number of experimenters in different countries took the subject up. By the time Boussingault—who had studied chemistry at a mining school—was led, through his marriage with a sister of M. le Bel, to take up "agricultural chemistry," there was also a large amount of information in the shape of papers communicated to learned societies and journals. On his brother-in-law's estate at Bechelbronn (in Alsace) he commenced a series of analyses of plant composition. One of his earliest inquiries was on the amount of nitrogen present in forage plants, and on the results he obtained he published a paper in 1836.\* The following year he was appointed Professor of Agricultural Chemistry at the Conservatoire des Arts et Metiers, and took in hand the question, whether plants obtain their nitrogen from the air? On this he published, in 1838.† With the numerous analyses made at this period by many chemists of the composition of plants, and the chemical constitution of vegetable acids, we are at present but little concerned.

PAYEN.

It should be noticed, however, that in 1836 and 1837 Payen wrote papers on starch (*amidon*) in the *Annales de Chimie et de Physique*,‡ and made careful analyses of starch obtained from different plants. Chemistry in its application to the Arts and to manufactures and to pharmacy, went steadily on, and the philosophic explanations of chemical actions was the subject of frequent thought by philosophic minds. It is, however, only in so far as their "principles" bear on the present subject that they need here be referred to.

Alongside of the ever widening attention to analyses and to the physics of chemistry a new branch of research, which has proved of such fascinating interest to many, was springing into existence.

Here it is necessary to look back somewhat in time from the date of Boussingault's paper just mentioned.

Priestley had, as far back as 1779, written:—"I have been so happy as by accident to have hit upon a method of restoring air which has been injured by the burning of candles, and to have discovered at least one of the restoratives for this purpose—it is vegetation." [A plate showing his simple method of observation is given with his paper.]

INGENHOUSZ, SENÉBIER.

But it was Ingenhousz, of Breda, then living in London, who at the same time (1779) first clearly defined the relation of the plant to the atmosphere, and showed that the absorption of the carbonic acid by the plant was dependent on the influence of the light of the sun, and not of the heat. Senébiér, of Geneva, also in 1779 took the subject up, and in 1782 gave his first important paper.

In 1792 he published in the *Journal de Physique* his memoir "On the great probability that carbonic acid gas is decomposed by plants in the process of vegetation." Continuing his researches, he in 1802 pub-

FIG. 42.—CHIRONIA PEDUNCULARIS: GREENHOUSE PLANT: FLOWERS PURPLE. (SEE P. 324.)

*G. Clusii* is a relatively scarce species, a native of the Jura chain and of the limestone Alps (altitude 1500—2000 metres = 5000 to 6000 feet). The leaves are shining, thick, leathery, lanceolate, and very pointed. The teeth of the calyx are separated by an acute sinus (interspace). The flower is of a beautiful deep blue colour, and has no green markings in the interior. This species lives and flowers well in our garden here, but makes few runners, and takes a long time to increase the size of the tuft. It does not flower again in autumn.

*G. angustifolia* is truly the most beautiful species of the genus. It has oblong, sometimes very elongated leaves, straight and narrowed towards the base. The divisions of the calyx are abruptly acuminate and contracted towards the base. The flower is large,

but its violet-blue flowers are not so beautiful as some others. There are five dark green spots in the throat. It is essentially a native of the Valais, and occurs in all pasturages between 2500 and 3000 metres elevation. It shuns lime, and belongs to the granitic flora. It is acclimatised here, but does not flower well.

*G. alpina* is one of the prettiest and most interesting species, but, unfortunately, it is rare and of difficult cultivation. The foliage is glaucous, and forms an incurved imbricated rosette, whence springs one little flower of an azure-blue colour. Its habitat is at once that of *G. acaulis* and of *G. verna*. It produces runners freely. *G. alpina* is only found on primitive rocks at an elevation of 2500—3000 metres, and is only to be seen on the Alps.

lished at Geneva his Physico-Chemical Memoirs "On the Influence of Solar Light in the Three Kingdoms of Nature, especially the Vegetable." In this he showed that carbonic acid was essential to the production of oxygen by sunlight. He also gave results of the examination of the action of different rays on germinating plants, and said he found that the size and extent to which the leaves grew was proportional to the intensity of illumination; that red rays had more effect than violet or blue; and that the green of leaves depended on the quality of the ray. Two years later he gave the results obtained by having separated out the green germinating matter of leaves (chlorophyll— $\chi\lambda\phi\upsilon\lambda\lambda\omicron\varsigma$ , green;  $\phi\acute{o}\lambda\lambda\omicron\varsigma$ , leaf) by solution in spirits of wine, and examined the action of light on this tincture. He examined it also in ether and essential oils. He further examined the action of light on the coloration of fruit and flowers. Here was a new line of research opened up, which, however, lay dormant for about forty years, though when resumed it led to important results, and is now actively pursued with the aid of delicate apparatus of recent construction.

#### DE SAUSSURE.

Following the more strictly chemical side of Senéquier's work, Nicolas de Saussure (son of the famous "alpine" H. B. de Saussure) took up, among his many investigations, the question of quantities of oxygen, carbonic acid, &c., involved in such changes as Senéquier had demonstrated. He introduced new methods\* for determining the amount of oxygen present in gaseous mixtures. He clearly proved that plants put to grow in an atmosphere freed from carbonic acid do not increase the amount of their carbon. He found they cannot decompose carbonic oxide. Here was established clearly the fact that the source of carbon in plants is the carbonic acid of the atmosphere. How they obtain it, the conditions under which they obtain it, and what particular parts of the plants are concerned in the process, remained for investigation at a future period.

The actual composition of plants, roots, seeds, fruits, juices, and of vegetable products used as foods, drugs, and in arts and manufactures, was being actively prosecuted, and this was being done by many chemists in many lands.

Meanwhile the explanation of chemical changes, and of the constitution of compounds that chemists obtained from many sources and examined, was receiving attention from deeply-thinking minds. The composition of an immensely greater number of compounds than De Morveau and Lavoisier were acquainted with when their "system" and "nomenclature" (mentioned above) was devised, had become known. Their proposed definition, for example, of an "acid" was found to be too narrow. To the word "radical," which combines with an "acid" to form a "salt," it was found needful to extend a wider meaning, as there were found so many "compound radicals."†

One most important piece of work, celebrated from the discussions it raised, especially with Berzelius, was that by Liebig and Wöhler on the radical of benzoic acid. They showed that it contained a radical ( $C_6H_5O$ ) common also to oil of bitter Almonds and other compounds.‡ To this they gave the name Benzo-yl. Here was introduced into

chemical nomenclature the termination yl, now so much employed. At the top of p. 262 they say they take the termination from  $\omega\lambda\gamma$ -matter. [The Germans equally use their own word "stoff," our "stuff," as in *wasserstoff* (hydrogen), &c., but not for radicals.] Following this kind of nomenclature we have hydrox-yl ( $HO$ ), Meth-yl, Eth-yl, &c.‡

The recognition of organic radicals was a very important step. While it gradually led to a change in nomenclature to the puzzle of those who did not closely follow chemical work, it opened up fresh subjects for enquiry. For a long time it was debated whether organic compounds obey the same laws as inorganic. No one now doubts that they do, but it is fully recognised they are far more complicated. *W. S. M.*

(To be continued.)

## ORCHID NOTES AND GLEANINGS.

### CYCNOCHES CHLOROCYLON.

A FIGURE of this Orchid appeared in the last volume of the *Gardeners' Chronicle*, at p. 145, showing a plant with an erect spike of two flowers, this being, so far as I have seen, about the usual number. A plant is now flowering at Kew which shows the variable character of the species—a character, however, common to the whole genus. It bears two pendent spikes of flowers, one with eleven and the other with eight; the flowers are much smaller than those in the above quoted figure. The sepals and petals are yellowish-green; the lip is creamy-white, with a dark olive-green blotch in the centre; and the column is about 1 inch long, with an inflated apex, where the pollen masses are inserted. The stem-like pseudobulbs are 12 inches high, with lanceolate, plaited leaves from 6 to 12 inches long. *W. B.*

### BOLBOPHYLLUM UMBELLATUM.

As none of the popular works on Orchids make any mention of this species, it is probably but little known under cultivation. It is figured in the *Botanical Magazine*, where it is said to have flowered at Kew in 1846; it has now appeared again, and proves to be an extremely pretty little Orchid—certainly not to be beaten by any other *Bolbophyllum*. The flowers are produced in a verticil at the top of a slender scape 6 inches high, each flower being about three-quarters of an inch across. The lower sepals are pale yellow, spotted with reddish-purple, and have the margins recurved; the upper sepal and the two petals (which are about one-third the size) are of a brighter yellow, thickly dotted with crimson spots. The purple lip is small, and is articulated in the manner characteristic of the genus. The species is a native of Northern India, and therefore requires cool-house treatment. It thrives well potted in peat-fibre and sphagnum.

### CATASETUM RUSSELLIANUM.

No doubt the time will arrive when *Catasetum* will be amongst the most popular of Orchids, for the interest of Orchid cultivators is happily no longer restricted to those subjects which have merely bright colour to commend them. Certainly no genus of Orchids shows the marvellous structure and arrangements to secure fertilisation by insect agency in a clearer or better fashion than do *Catasetums*. The power certain kinds have of swiftly ejecting the pollen masses, when either of the horns attached to the column are touched, is in itself one of the most interesting phenomena in the floral world. Neither are they destitute of beauty; few Orchids, indeed,

\* In floriculture "fancy names" are used which have no meaning. It may be well to mention that names used by chemists have a definite meaning which refers to the composition of the compound named.

Lothar Meyer has said, "chemical symbols and formula which a few years ago received such prominence, are now regarded with indifference, since what was formerly expressed symbolically and indistinctly, or even without proof or clearance, by their aid can now be expressed in clear words with fixed meaning." But query? Do all chemists conform to this fixed meaning?

produce a finer effect than *C. Bungeorhithi*, a recent introduction with large beautiful white flowers. It has been well figured and frequently mentioned in these columns. *C. Russelianum* is one of the older but still desirable species, having been introduced from Guatemala in 1838. It has pendent spikes of from twelve to eighteen flowers, produced from the base of the ovate pseudobulbs. The flowers are 3 inches across the sepals, these and the petals being pale green marked with lines of a deeper shade; the lip is similar in colour, and is slipper-shaped and somewhat indented; at the sides and front the margin projects forward and is fringed. A plant with thirteen flowers is blooming now at Kew. Like the other species it enjoys abundance of warmth, moisture and especially light during the growing period, and a prolonged period of rest afterwards. *W. B.*

### CATTLEYA LODDIGESII, Lindl.

This, the first *Cattleya* ever introduced into European gardens, is a fine autumn flowering plant, and may just now be seen in perfection in various collections. It was originally received from Rio de Janeiro by the Messrs. Loddiges, of Hackney, early in the present century, and may be found figured in their *Botanical Cabinet*, t. 337, under the name of *Epidendrum violaceum*. Lindley founded the genus *Cattleya*, on *C. labiata*, about the year 1822, at which time he added *Epidendrum violaceum* as a second species, under the name *Cattleya Loddigesii*. It is a rather widely diffused plant, and, according to the Messrs. Veitch, is spread over Southern Brazil from the Organ Mountains to the Rio de la Plata, from the Atlantic Ocean almost to the River Uruguay, growing in a great variety of situations, sometimes on trees, sometimes on bare rocks, both in shade and in full exposure to all weathers—circumstances which more or less influence the habit of the plant, and the size and colour of the flowers. No special treatment is required for its successful cultivation beyond that necessary for other ordinary species of the genus. *R. A. R.*

### CATTLEYA AUREA MARMORATA.

There is now in the gardens of Lord Rothschild at Tring Park a most remarkable and exquisitely beautiful *Cattleya* of the *C. Dowiana aurea* class, which came in an importation received by Messrs. Shuttleworth, Carder & Co., Park Road, Clapham. It appears to be a natural hybrid between *C. aurea* and *C. gigas*, and those who know the superb *C. Hardyana* can picture this fine form by imagining a flower intermediate between it and *C. aurea*. The variety *marmorata* has large flowers, the ground colour of the sepals being yellow, the sepals slightly, and the beautifully crimped petals heavily, marbled with dark rose colour. The finely-expanded labellum is violet-crimson on the front portion, and golden-yellow veined with purple on the basal half. The whole lip has a purple margin. In point of beauty and fragrance it is equal to the best *Cattleya*; and Mr. Hill is hopeful that similar forms will appear among the other plants received from the same importer. *Cattleyas* are well grown by Mr. Hill, and these newcomers could not get into other hands. When in an article on large-flowered *Cattleyas* in the *Gardeners' Chronicle*, p. 404, September 29, 1883, I predicted the coming of these intermediate forms between *C. aurea* and *C. gigas*, the present magnificent variety is just the plant I had in my mind. *James O'Brien.*

### CYPRIPEDIUM MITEAUNUM, Linden, t. 146.

Leaves oblong green, with dark spots, peduncles rufous, hairy; flowers 4½ inches across, upper sepal broadly ovate, acute, white, with numerous purple stripes; petals linear oblong, red-violet, with tufts of dark hairs on the edge; lip reddish-brown, shining.

**FRUIT AND VEGETABLE EXHIBITION AT BARNET.**—An exhibition of the above on a large scale is being organised by Mr. John Munro, formerly of Potter's Bar, to take place at New Barnet at the end of September or the beginning of October. A great deal of local support is being promised, and a schedule of prizes will shortly be issued.

\* He used sulphide of potassium and phosphorus as agents in analysis.

† Much of the work that Lavoisier and his friends did in classification and nomenclature cannot even now be overlooked without the chance of mistaking the meaning of words we still use, such as "acid," "salt," "base or radical." For the son of a cultivator, on the modern side of his school, here is a holiday amusement. "Le mot acide sera le nom générique; chaque acide sera ensuite différencié dans la langue comme il est dans la nature par le nom de sa base ou de son radical." This is on p. 58 of vol. i. of the four volume edition mentioned. The context will supply the explanations. A sister or cousin who carried off a French prize last half may perhaps help. How plants obtain their carbon was worked out while carbon dioxide was still known by Lavoisier's name "l'acide carbonique," and oxygen was called "l'air éminemment respirable," "l'air pur," or "l'air vital." So, historically, the question of nomenclature is not altogether unimportant.

‡ *Untersuchungen über die chemische radikal der Benzoesäure.* *Ann. Pharm.* vol. iii., 1832, p. 249.

## CULTURAL MEMORANDA.

## WALLFLOWERS.

OF the plants raised from seed—sown in boxes placed in heat, and the seedlings subsequently pricked out, 6 inches apart, on a few inches of good soil, placed above a thin layer of short dung, resting on a hard soil or cinder bottom, in a sunny aspect—some of the bushiest should now be lifted with nice balls of soil, and be potted into 6-inch pots. After watering them, stand on a bed of coal-ashes, cover with a frame, and shade from sunshine until the roots have pushed into the fresh soil, when free ventilation must be afforded them, watering when necessary, and giving weak liquid manure two or three times a week after the plants are well rooted. A portion of the Wallflower plants thus grown should be put into a greenhouse, or, better still, a pit, about the end of November, where a temperature of from 40° to 50° is maintained, and where the plants can have a position near to the glass. The presence of this familiar and deliciously-scented harbinger of spring in the dwelling or conservatory in mid-winter is always appreciated. Belvoir Castle, of a soft yellow colour, and Harbinger, a dark brown one, are desirable varieties.

## VIOLETS.

No time should be lost in lifting Violet plants which were planted out in the spring, and planting them with suitable balls at 12 inches apart, in frames from which frost can be kept out. The leaves should be but a few inches from the glass, and the roots before planting shortened back a little—those protruding through the balls of earth—before planting, and the soil should be made firm in planting. The runners must also be pinched back to the crowns, and afterwards be kept persistently pinched off during the next six months to favour the production of blooms. After planting, water the bed to settle the soil, and shade from sunshine for a few days.

## RICHARDIA ETHIOPICA.

These should now be lifted with a mass of soil and roots in proportion to the size of the pot into which it is intended to pot them, using a mixture of four parts of good loam and one of leaf-mould and short dung. The pots should be well crocked, and the soil worked in amongst the roots. A large proportion of my plants are potted into 12-inch and 9-inch pots, the remainder being put in 7-inch and 6-inch pots, for arranging on the side stages of conservatory and various other purposes. After potting stand the plants under a south wall, or where they will not sustain injury from a few degrees of frost and where they can be shaded from sunshine until the roots have pushed into the fresh soil, when full exposure is best for them. The plants, when placed in position, should be watered to settle the soil about the roots, and in due time they should receive copious supplies of tepid liquid manure, to enable them to develop large flower-spikes. The plants should be housed before they are likely to get injured by frost; it will not be safe to subject them to more than 3°.

## EUPATORIUMS, BOUVARDIAS, AND SALVIA.

Where these are grown in the open ground they should be taken up now and potted, employing a compost of three parts of fibry loam and one of leaf-soil, with a sprinkling of sharp sand added, afterwards putting the plants in a pit, where they can be kept close and shaded for a few days, until re-established, when full exposure is best. After the Bouvardias have got well established they should have a minimum temperature of from 55° to 60°, according as the weather is cold or mild, with a proportionately high day temperature—say, from 70° to 75°. Should aphids put in an appearance on the plants, fumigate a couple of evenings in succession with tobacco-paper, following this with a liberal use of soft-water and the syringe, and free ventilation

for a few days, weather permitting. The Eupatoriums and Salvias should be put into the greenhouse, or anywhere out of the reach of frost, where they can have abundance of light and air for the time being. H. W. Ward.

## CROCOSMA AUREA.

This is a useful plant to grow either for the greenhouse or for cutting purposes, as it affords a shade of colour seldom met with in anything else, and the lightness of its tall spikes and flowers makes it an admirable flower for vases. When required for the last-named purpose, it is best to grow it outdoors, for though not quite hardy, it is sufficiently so to stand in certain situations, the most suitable being in a border under a sunny wall, where, with only slight protection during winter the bulbs will escape injury, and come up very strong in the spring. To help to ensure this, it is a good plan to drain before planting, and to prepare the soil, as the Tritonia, as it is generally called, will not bear excessive wet when at rest, and likes a free sandy loam, in which it sends out its creeping roots, and it then spreads with great freedom.

When grown in pots the bulbs should be potted in 6 or 8-inch pots, and placed from six to nine in a pot, covering them to a depth of 2 inches. The pots may be stood in a cold frame and left till the leaves show, when water should be afforded in gradually increasing quantity, and at the end of May, or before, they may be plunged in the open ground and there left till they began to show bloom. Treated in this way they are not subject to red-spider, as is the case when grown under glass, and which soon spoils the foliage. J. S.

## RUDBECKIAS.

There are several varieties of these, but there is only one of high merit, and that is R. Newmanni, which deserves a place in any collection of herbaceous plants, as not only is it exceedingly showy when it blooms, but it comes into flower late, and will stand any amount of rain or bad weather without looking any the worse. The habit of R. Newmanni is dwarf and spreading, and the plant has large rough leaves, the flower-stems being branching, and rising to a height of from 1 to 2 feet, and these are terminated by large bright yellow blooms, with a conspicuous black cone or disc in the centre. The readiest way to propagate this Rudbeckia is by division, and this may be effected late in the autumn or spring, at either of which seasons the plant may be cut through with a sharp spade, and the side portions taken away and replanted at once. Like most herbaceous subjects it is fond of good soil and plenty of depth, but plants of it will be found to do very well under adverse conditions, as it is tenacious of life, and only suffers where it cannot get the requisite moisture. J. S.

## TREES AND SHRUBS.

## CONIFERS.

FROM the plantations at Ochertyre, near Crieff, Mr. Croucher sends us a hamper of branches of Conifers, showing their vigorous growth and suitability for the climate of Perthshire. Among them are unusually fine specimens of Abies (Picea gardens) cephalonica with foliage of great size and substance and of pale green colour. The young cones are of an exquisite light-brown colour shot with pink. In the South this tree is often spring-tender; perhaps in the North it does not start into growth so soon, and hence escapes injury; at any rate, the specimens from Ochertyre seem to indicate that the tree would not only be ornamental but valuable for timber.

Abies grandis is remarkable for the very rich deep black-green of its foliage, and for its greenish-brown cones.

The Douglas Fir is represented by two forms, the one known as Stairii and another of similar character, but which is even more remarkable in the pale yellowish tinge of the foliage than Stairii.

Abies Lowii, alias Parsonsiana, &c., is sent to show the great difference between it and the true A. concolor, which latter has long leaves, equal in length, alike in colour on both surfaces, stouter branches, larger buds, and other characteristics pointed out to us and recorded in these columns by Mr. Barron. These differences in extreme cases are sufficient to warrant a distinct name, but in looking through seed-beds or nursery rows we have always found so many intermediate forms as to be puzzled to give a name to any particular specimen.

Picea Engelmanni is represented by some finely-grown shoots of a pale fawn colour, the slender bluish leaves all appressed, and (when stroked the right way) soft to the touch. The light-brown buds are ovoid-conic, and not resinous. In the South this tree grows slowly, and seems tender, while its near ally, P. pungens, (often called Parryana, or commutata) is much more robust. The green form is very handsome, but the blue form, pungens glauca (alias Parryana glauca) is decidedly the most beautiful of its race, and keeps its colour throughout the year.

Picea excelsa aurea, like the form called finlandensis, is remarkable for the very deep orange colour of the two or three-year-old shoots, the shoots of the year being of a pale fawn colour deepening in time into the rich colour just mentioned.

P. ajanensis is sent under the name Alcockiana, seeds of the two having been originally inadvertently gathered or mixed under the same name. What is now recognised as ajanensis, is a flat-leaved Spruce with the young shoots fawn coloured, those of the two and three years pale orange; the leaves are appressed, and more or less parallel with the branches on the upper surface spreading beneath. In this species the upper leaf-surface is silvery white, the lower deep green. The female cones in spring are erect, of a lovely tint of carmine. As they ripen they lose their brilliant colour, and occupy the ends of the branches, either standing out horizontally, or being more or less deflected. This is one of the most beautiful Conifers in cultivation, and the rapidity and vigour of its growth, as shown in the specimen before us, seem to indicate it as of great value for timber also.

P. Menziesii is a better known tree of similar character, but with more spreading, 4-sided sharply-pointed leaves, the cones more slender, and its scales more gradually pointed and concave at the back.

Tsuga Mertensiana, alias Albertiana, is remarkable for its very graceful pendulous branches, with silvery leaves and small cones like Hops.

## THE SEED TRADE.

THE FOREIGN GRASS AND CLOVER CROPS.—Advices from Darmstadt, the head-quarters of German Grass and Clover seed growing, state that the crops are later this year than for many years past, the retarding season having been felt as much there as in our own country. Heavy and uninterrupted rains have caused the delay; in the early part of the season and up to the middle of June there was a great lack of moisture, and the drought prevented development. The season has proved quite the reverse of last year, when the spring was very wet, followed by a summer of distressing drought.

The earlier crops are somewhat inferior in quantity and quality to those of last year, the grain lighter in weight and lacking colour. Careful cleaning has improved the samples, and they are scarcely less inferior to the best produce of former seasons.

The crop of Dactylis glomerata (Rough Cocksfoot-grass) is a short one; the quality of American seed bad, that of New Zealand in every respect superior to last season's, as well as larger. The earliest shipments are decidedly good; later ones are said to be certain to be lighter and inferior in quality. The crop of Alopecurus pratensis (Meadow Foxtail-grass) amounts to about the same quantity as last year; the seeds will be heavier, and show good growing qualities. From some districts poor samples have come, and it is advised that the lighter seeds

be avoided, especially as the bulks have at times a better and more attractive appearance than the heavy samples. Of *Festuca pratensis* (Meadow Fescue-grass) the quantities harvested this season are reported to be much below those formerly brought to market, and this applies to home-grown as well as to the American seeds. In both countries the low prices which ruled did not pay the growers, in consequence the greater part of the seed growing districts have been ploughed up to substitute other produce. The crops of *Festuca ovina* (Sheep's Fescue) and *F. duriuscula* (Tall Sheep's Fescue), are decidedly smaller than usual; while the quantity of *F. ovina tenuifolia* (Narrow-leaved Fescue) harvested is so very small that the ordinary English demand alone cannot nearly be supplied. *F. elatior* (Tall Fescue) has been harvested in Germany in small quantities, but the quality is very good; the value is to some extent discounted from the fact that the New Zealand crops are heavier than heretofore, but the seeds are wanting in quality, and appear to be much affected with ergot—a disease to which Rye is subject, but which is not at all uncommon among other grasses. The quotations for this grass are lower than heretofore, and a large demand is anticipated.

*Poa pratensis* (Smooth-stalked Meadow-grass) has been harvested in good condition and in fair quantities, so there will be no lack of suitable seed. *P. nemoralis* (Wood Meadow-grass) is, on the other hand, again very scarce; and desirable, true and un-mixed samples are seldom to be met with. *P. trivialis* (Rough-stalked Meadow-grass) will be about the same as last year, and fine true seed can be offered at reasonable prices. The demand for this grass is increasing yearly.

Of *Anthoxanthum odoratum* (Sweet Vernal-grass) the crop of true genuine seeds will be of the same limited quantity as last year.

*Cynosurus cristatus* (Crested Dogtail-grass) will be about the same yield as last year, but the seed will be lighter in weight and darker in colour.

*Phleum pratense* (Timothy-grass) will be a good yield.

Clover seeds have sustained serious damage by the heavy rains, but Minette White and Alsike Clovers have suffered most. What little has been harvested is of poor colour; and a good sample is scarcely to be met with. It is yet too early to form a definite opinion as to the yields of Lucerne and red Clover seeds; but, in consequence of the incessant rain the plants show great rankness of vegetation, without, however, apparent formation of flowers. So it is feared a bad harvest of these will have to be recorded also.

## OPUNTIA FRUITS.

Our illustration shows an example of independence and self-containedness not very rare among plants, and especially among Cactaceæ. The illustration (fig. 43) is taken from a specimen exhibited by Mr. D. Morris before the Scientific Committee in the course of the summer, and shows how, from a fruit containing seeds in the interior, roots were produced below, and young shoots from the upper part after the fall of the corolla and stamens. One single joint or internode in this case thus suffices to form an entire plant equipped at all points. The following extract from Masters' *Vegetable Teratology* may be of interest in this connection:—

"The fruits of *Opuntia Salmiana*, *O. fragilis*, *O. monacantha*, and of some species of *Echinocactus*, have been observed to form small fruit-like branches around their summits. M. Napoléon Doumet describes the fruit as ripening as usual, but as being destitute of seeds in the interior [seeds were abundant in Mr. Morris's specimen]; after a little while the fruit begins to wither, and then a circle of small buds, like those of the stem, may be seen at the top of the fruit, each bud springing from the axil of a little tuft of wool and spines found on the fruit. These little buds elongate into long shoots, produce flowers

the following year, which flowers exhibit the same peculiarity. Gasparini and Tenore are said to have recorded the same fact as long since as 1832. The specimen from which the figure was taken produced its fruits in the Royal Gardens at Kew, and is now preserved in the museum of that establishment. The adventitious growth in three cases appears to arise from the tufts of spines, which, it has been suggested, are the homologues of the sepals. There can, how-

FIG. 43.—FRUIT OF OPUNTIA CUT OPEN (SEE TEXT).

ever, be little doubt the outer and lower portion of the fruit of *Opuntia* and its allies is a dilatation of the flower-stalk."

## TRADE NOTICE.

MR. GEORGE BOND has been appointed Manager to the nursery and seed business at the Calme Nurseries, Wilts, in succession to Mr. R. Brown.

## NOVELTIES.

The following new introductions appear in the Catalogue of L'Horticulture Internationale of Brussels:—

- ACALYPHA TRIUMPHANS.—Stove foliage plant.
- AGLAONEMA NEBULOSUM, N. E. BROWN.—Stove foliage plant, Aroid.
- ALOCASIA GIGAS.—Stove Aroid.
- ALOCASIA LINDENI.—A New Guinea Aroid, with handsome foliage, having ivory-colored petioles and yellowish veins.
- ALOCASIA LUCIANI X.—A cross between *A. Thibautiana* and *A. Putzei*.
- ALOCASIA MARGARITÆ.—Stove Aroid, with fine foliage.
- ALOCASIA VILLENEUVEI.—Stove Aroid, with fine foliage.
- BULBOPHYLLUM GRANDIFLORUM.—Extraordinary Orchid.
- COLOCASIA DEVANSAYANA.—Stove Aroid, fine foliage.
- CRINUM MASSAIANUM.—A Tropical African species, with white flowers striped with crimson.
- DENDROBIUM STREBLICERAS, var. ROSSIANA.—Differs from the type in its white flowers.
- DIANTHERA DULLATA.—Acanthaceous stove plant, with fine foliage.
- GALEANDRA D'ESCRAGNOLEANA.—Brazilian Orchid, segments yellow, lip yellow, spotted with rose.
- KENTIA ELEGANTISSIMA.—Elegant stove Palm.
- LADISIA ALATA.—Ornamental stove shrub.
- LADISIA POTHONA.—Ornamental stove shrub, allied to *Ardisia*.
- ODONTOGLOSSUM BODDERTIANUM.—Segments yellow, spotted with brown; lip white, spotted with purple.
- PAPHIA LINDENIANA.—Stove Orchid.
- PHRYNIM VARIEGATUM.—Stove foliage plant.
- PIPER RUBRO-VENOSUM.—Stove climber; leaves green, marked beneath with rose-coloured nerves.
- RODRIGUESIA BUNGEROTHII.—Stove Orchid.
- SCHIZOCASIA REGNIERI.—A Siamese Aroid, with ornamental foliage.

## SHRUBLAND PARK.

[SEE SUPPLEMENTARY SHEET.]

SIR GEORGE BROKE MIDDLETON was a man of note, who had done good service to his country, a man who well earned the respect and confidence he won, but it is questionable whether, to the mind of the ordinary gardener, Shrubland is not more intimately associated with the names of Donald Beaton and T. Blair than with that of the former proprietor of this noble estate. And this is not the only paradox about Shrubland. In a county not particularly renowned for picturesque beauty, Shrubland offers views of hill and dale, wood and water, which of their kind, cannot be surpassed anywhere. The park is extensive, the Spruces and Scotch Firs effective. The mansion is a noble structure, reconstructed by Sir Charles Barry, and the differences in level demand the introduction of terraces and steps which add great dignity to the mansion. What those terraces were twenty years ago is detailed at great length in our volumes for 1867 and 1868. At that time they formed one of the finest examples of architectural gardening to be found in the country. Looking through the record it seems as though the style of gardening then adopted, appropriate as it was in kind, was overdone in degree, and this has led to its abandonment or modification. How it looks now, when a different but hardly so appropriate a system is adopted, we are not in a position to state, our visit having been paid in spring. The two views we now give show what a fine feature a long, well-proportioned, straight grass walk may become edged by lofty *Arbor-vita* and Cedars, which give the necessary variation in outline, while the contrast between the sombre Yews and the unfettered flowing festoons of the Roses is delightful. It forms no part of our purpose to attempt to describe Shrubland—descrip-

tions of lovely landscapes are seldom lovely themselves, and rarely convey any idea to those who have not seen them. The gardens, too, have been shorn of much of their former magnificence, but the exquisite landscape forms remain, and it would be a great oversight to omit mention, even in ever so cursory a notice, of the grandest Sweet Chestnuts to be seen in the country—such boles! such a world of knots and cracks! such spiral furrows ploughed in their bark! What the age of these veterans may be we cannot say. A thousand years is attributed to them, but only vaguely. Probably they are some few centuries short of the assigned age; but, in any case, on looking at these noble survivors of bygone ages, the thought that Chestnut-wood might, after all, have been used for building purposes in England in those days, would arise, and so the glory of the trees became associated in one's mind with the marvels of architectural beauty and with the records of history in a manner as suggestive as it was interesting. One of these giants measures 46 feet in circumference at the base.

One of the finest modern developments of Shrubland is the planting both sides of a ravine with hairy Bamboos intermixed with *Dracenas*, *Cannas*, *Maize*, *Funkias*, and other bold and graceful plants. This bids fair to form one of the most beautiful features of the place, and owing to its situation possesses that highest form of beauty—beauty of appropriateness. Shrubland is also one of those places that has a somewhat out-of-the-way interest—an interest that would not be felt but by a naturalist, for here it was that a Barrington Peach produced on one branch a Peach and a Nectarine: a "sport," says the gardener—a dissolution of partnership, a separation of heretofore mixed elements, says the botanist. But how? Why? Why was the phenomenon not repeated? If one lived as long as those Chestnuts, time would not suffice for the explanation of the mysteries of vegetable life!

## PLANTS AND THEIR CULTURE.

**CYCLAMEN PERISCIUM.**—In raising plants of *C. periscium* and its varieties, to bloom within fifteen months from the time of sowing, the best practice is to sow the seed in the autumn, soon after it is ripe, in pans or boxes which have been well soaked in water and properly crocked, and filled with light loam and leaf-mould, or peat with sand in about equal proportions. Sow thinly, and fairly well cover them, gently pressing them into the soil; the pans should afterwards be very lightly watered, and stood or plunged in some moisture-holding material near the glass, in a temperature of about 60°, special care being taken to prevent the soil getting in the least dry, covering with a piece of glass; but they germinate more freely, it kept sufficiently moist, without such covering. As soon as the young plants have developed a true leaf, they should be pricked off into larger pans or boxes, still using a compost similar to that employed in the seed pan. Return them to the same temperature, but when they have made another leaf the temperature may be allowed to fall a few degrees, and when they have made a nice crown of leaves they should be potted off singly, using pots suited to the size of the plants. At this and subsequent pottings use a rougher turfy compost, one half of it being loam, with plenty of sharp sand, and if a little quantity of some prepared fertiliser be well incorporated the compost will be improved. The potting should be done firmly, leaving the crown of the corm level with the soil. From what has been said it will be evident that low-roofed structures are best suited for these plants; indeed, excellent results may be had with frames even in winter, provided they have sufficient hot-water piping to prevent the temperature falling below 45°, but with a low temperature considerable care must be exercised in watering and in maintaining the proper amount of atmospheric moisture. Should either be in excess damping-off will occur. When coming into flower a mild, airy atmosphere is indispensable to prevent spotting by damp. If the stock is kept up annually from seed (which is preferable to getting old plants) the first named temperature must be maintained, otherwise little progress will be made. Any plants intended to flower this

season, and which are not yet in their flowering pots, should be pushed on with all diligence. The *Cyclamen* is very subject to insect pests, and which, if they once obtain a footing, and measures are not speedily taken against them, quickly spoil the plants. As a preventive thorough syringing during growth is most advisable, and when that may not be done there is no more effective plan than to sponge and wash them in a weak solution of some kind of insecticide. Having recently experimented with insecticides I have obtained good results from the soluble paraffin prepared by the Agri-Horticultural Co., of Glasgow, but others are equally good, especially tobacco-juice when of certain strength,—but this article varies considerably. If fumigation is resorted to it must be carefully done, as the leaves are easily injured. *F. Ross, Pendell Court.*

## THE HARDY FRUIT GARDEN.

As the ingathering of Apples and Pears will soon begin the fruit-rooms should be put in good order at once, whitewashing the walls and ceilings and cleaning the shelves, but not using much water, as it will soak into the wood; and, unless the shelves can be thoroughly dried, their surface soon becomes covered with a white mould, which is very injurious to fruit, especially Apples. If water be used it should be during the summer season. It is always a good plan to have the fruit-room for Apples and that for Pears quite apart, for all that Apples require is merely to have the frost kept from them, whereas Pears, generally speaking, require a room where a little artificial heat may be applied, so that the average temperature can be kept at about 45°. In these gardens there are two such rooms; that for Pears has a 3-inch flow and return hot-water pipe running through it, with a valve placed in an adjoining shed, so that the heat can be regulated to a nicety; the Apple-room is unheated: it occupies a northern position, and the walls are 9 inches thick. In addition to the ordinary entrance door we have another which fits in tightly in the same frame, so that there is a space of 6 inches clear between the first and second door. By using this door, closing the ventilators, and putting a shutter over the window we are enabled to keep out frost, and the Apples keep in a sound and plump condition until the season is very far advanced, or Apples come again. When speaking of Pears requiring a warmer temperature than Apples in which to ripen, I may mention the following few varieties that are really better flavoured when ripened in the cooler temperature of the Apple-room, viz. *Seckle*, *Maréchal de la Cour*, *Dana's Hovey*, *Althorpe Crassane*, and *Burré Hardy*. Fine weather having now set in advantage should be taken of it to give all fruit quarters a good hoeing, and the weeds should be raked off, for they will take root again if left on the ground. All fruit trees on walls, as well as pyramid and bush trees, should be looked over for the last time, and the young growths stopped back closely to assist the fruiting spurs to plump up their buds. *A. Ward, Stoke Edith Park.*

## FRUITS UNDER GLASS.

**PEACHES.**—The wood on the earliest trees will now be well matured, and ready to drop; and a few Larch twigs may be drawn lightly up the shoots to detach any of the ripier leaves, so as to allow of the sun having free play upon the shoots. If the sashes of a house have been removed, they should now be replaced, but the fullest ventilation should be afforded, and the sashes closed only during heavy rain. In houses where the roof is not portable, attention must be given to watering the borders, even if the foliage is falling, as the roots are still active and the need of nutriment. Now is the time to prevent bud dropping by keeping the borders in a state of medium moisture. Where the trees are old and have carried a full crop of fruit, an occasional application of liquid manure will prove very beneficial. Trees from which the fruit has recently been picked, should have all the superfluous shoots removed. The present is a good time to attend to the borders, if the trees are not in a satisfactory condition. Hazel loam of good quality with an addition of old mortar rubbish will be found a suitable soil for the successful cultivation of the Peach. Where the soil is of a tenacious nature a large

addition of charred garden rubbish, brickbats broken to the size of pigeon eggs, together with the finer particles, and a liberal admixture of mortar rubbish will be requisite to keep the soil from running together. It may not be necessary to wholly lift the trees, but if the roots have made their way through the drainage, they must be brought to within a short distance of the surface. Trees in late houses will require some slight assistance of fire-heat to maintain a sufficiently buoyant atmosphere, and plenty of ventilation. Expose every fruit to the sun as much as possible; look sharply after blue-bottle flies and wasps, taking steps to trap or exclude them from the house.

**Figs.**—The earliest trees will now have mostly shed their leaves; they should, however, be frequently syringed, and have occasional applications of manure-water. Trees which are finishing their crops should be afforded a genial dry atmosphere, so that the proper flavour may be imparted to the fruits. The syringe must not be used so freely as formerly, and where the fruit is nearing maturity water should not touch it. Let the fruit be quite ripe before gathering; they require at this season of the year a much longer time to finish than during the summer months. It is not too late to remove all sprayer growth from trees which have just finished their second crop, and if the trees are clean, the use of the syringe may be largely dispensed with, and a nice warm atmosphere maintained by fire-heat and sun-heat, with abundance of air, until the foliage falls naturally. Remove all fruits which are visible. Trees, walls, trellises, borders, and glass in the early house should now be thoroughly cleaned, and any necessary painting done. *W. M. Baillie, Luton Hoo.*

## THE KITCHEN GARDEN.

**CARROTS.**—Where soils are cold and wet, these roots should now be taken up and stored, any excess of moisture at this season causing them to split, especially if it occur after a period of fine weather. In sandy soils, such as the Carrot delights in, the short-rooted varieties may be pulled up by hand, but in others it is best to remove some of the soil away from them with a fork previous to doing so. The tops should be cut carefully so as not to injure the crown, and any soil adhering to them should be cleaned off; they will then be ready for storing. I find that the roots keep the freshest when they are put up in ridge-shaped heaps in any cool position outdoors. These should be about 3 feet wide at the base and 2½ feet high. The roots should be carefully handled so as not to bruise them, and packed in layers with the crowns outwards. Enough straw should then be drawn straight, and laid over the sides of the heap to prevent the soil from touching them, and bunches of straw fixed for ventilators along the top of the ridge about 4 feet apart. The sides should then be covered over with 6 inches in thickness of soil. In this way Carrots will keep good until late in the spring.

**Beet** should be carefully lifted and stored in a manner similar to the Carrots before severe frost is expected, this being the most tender root the kitchen gardener has to deal with. Great care is required in storing this vegetable so as not to break or bruise the roots in any way; and the tops should not be cut but twisted off with the hand.

**Cauliflowers.**—A piece of ground in a sheltered and warm position should now be prepared for planting these under hand-lights, by digging in a plentiful supply of manure, preferably that from the cowyard, and working the soil down well with the spade as the work proceeds. *W. H. Divers, Ketton Hall, Stamford.*

**GREEN PEAS.**—The district round Maldon, in Essex, is famous for its green Peas, and a month back the Great Eastern was running three trains a day loaded with green Peas only. This summer the crop has been heavier than ever; and one single day, August 4, saw the biggest consignment on record, amounting to 578 tons, all of which were safely delivered by 7 o'clock the following morning. It shows the extraordinary character of the present summer that the entire month of August last year only accounted for 16 tons, while August, 1884, and August, 1885, had only a total of 10 tons between them. *Murray's Magazine, September.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

**GARDENERS' CHRONICLE OFFICE TELEGRAMS.**  
NOTICE to Correspondents, Advertisers, Subscribers and others. The Registered Address for Foreign and Inland Telegrams is "GARDCHRON, LONDON."

**NOTICE TO SUBSCRIBERS AND OTHERS.**  
Post-office Orders and Postal Orders should be made payable at the Post Office, No. 42, DRURY LANE.

## APPOINTMENTS FOR THE ENSUING WEEK.

### MEETINGS.

TUESDAY, SEPT. 25. Royal Horticultural Society: Fruit and Floral Committees.

### SALES.

MONDAY, SEPT. 24. Dutch Bulbs, at Stevens' Rooms, at Protheroe & Morris' Rooms. Dutch Bulbs, at 123, Fenchurch Street, by Messrs. Smail & Co.

TUESDAY, SEPT. 25. Greenhouse Plants, at The Hall, Dulwich, by Stevens. Orchids in Flower, at Protheroe & Morris' Rooms.

WEDNESDAY, SEPT. 26. Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at 123, Fenchurch Street, by Messrs. Smail & Co. Orchids, Lilies, &c., at Stevens' Rooms.

THURSDAY, SEPT. 27. Dutch Bulbs, at Protheroe & Morris' Rooms. Greenhouse Plants, at the Brunswick Nursery, Tottenham, by Protheroe & Morris.

FRIDAY, SEPT. 28. Imported Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs, at 123, Fenchurch Street, by Messrs. Smail & Co.

SATURDAY, SEPT. 29. Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

Botany and Horticulture.

The address delivered before the Biological Section of the British Association by the Director of the

Royal Gardens, Kew, will be read with interest by many classes of readers. As was befitting a botanist holding such a position, Mr. DYER alluded in his address to many departments of his subject. By so doing, he did much to enlighten the general public, who look upon botany as an agreeable recreation, barring the hard names! Mr. DYER, at any rate, takes a juster and more comprehensive view of his subject, and displayed it before his audience as forming one department of biology, and one which, while in no degree inferior to its sister science, zoology, forms the appropriate introduction to its study. Mr. DYER's address was comprehensive, but it was long—we do not say too long, although its length forbids us from inserting more than a moiety, and compels us to leave out the portions relating to fermentation, not by any means as the least important, but as the part which, under existing circumstances, has the least direct interest to our readers.

Mr. DYER did not wholly ignore horticulture, nor, considering the wide scope of his address and the limited time at his disposal, could he have consistently devoted much more space than he did to its claims as a part of biological science. We hope, however, the opportunity will come for the Director of Kew to stand forth, as he is so well fitted to do, and enforce upon the botanists and physiologists the supreme importance of horticulture as a branch of biological science. That the public should look on horticulture simply as a means of supplying their requirements, æsthetic or material, is intelli-

gible enough; that commercial men should regard it as a means of making money is equally legitimate. To their honour be it spoken, many of them do not regard this as their only object. Scientific botany would be very materially weakened by the abstention of the importers, the raisers, and the professional growers of plants, whether new or old.

The importers furnish the means to the botanist of vastly increasing his knowledge of certain groups. Our knowledge of Orchids, for instance, without their aid, would not now be so very much greater than it was in the time of LINNÆUS. Whole districts would be even now botanically unknown were it not for the labours of the collectors sent out by our plant merchants.

The raisers of new plants, those who develop existing materials into entirely new combinations, by hybridisation, or by cross-breeding, or even by selection only, contribute still more remarkably to biological science. They even create new types of structure. Look at the tuberous Begonias, for instance—a quarter of a century ago no such thing existed, now they form a distinct type. It will be said that they do not exist in Nature—perhaps not, but in any case do they not afford an illustration of the way in which new types may have originated, or do originate, in Nature?—do they not furnish a very plausible explanation of the way in which natural variations have been brought about? The *Gentiana acaulis* alluded to by M. CORREYON in a preceding column affords another illustration of a variety that is constant under many variations of soil and circumstance, which has been so for many years, but which has no exact counterpart in Nature. Consider also the "sports" with which the gardener has so much to do; the word is unfortunate, it is true, but its meaning is sufficiently well known. Do not these productions throw material light upon the nature and range of variation in plants?

Look back to the interesting statement that Mr. NOBLE placed on record in our columns a week or two since as to the history and peculiarities of the white variety of JACKMAN'S Clematis, and see whether that does not illustrate the cause of variation in a remarkable degree. Look, too, at the persistent efforts of the seedsmen and raisers to secure a new Pea, or a Strawberry, or what not, that shall be earlier or later, even but by a few days—which shall be suited to this, that, and the other climate and soil—and see how constant and continuous is the progress of modification they effect. We may smile sometimes at the eagerness with which a plant that flowers a day or two earlier than another is brought under notice and its qualities extolled; the change is sometimes almost imperceptible, and the advantage as infinitesimal; but look back a generation, or even ten years, and see then how much has been effected by the slow but constant accumulation of progressive modifications. If man can do so much in his brief span, what may not be done in Nature?—what must not have been done in the countless ages that have rolled over our globe?

And from an opposite point of view, how much has been effected in the way of fixity by the labours of the gardener? We must not pursue the subject here, but we may urge that if the fixity of Egyptian plants, as illustrated in the tombs and mummy-cases of the Nile Valley, be adduced as an illustration of permanence of character, dependent on the existence of like conditions, surely, the labour of the gardener who, in a degree at least, secures a corresponding

amount of fixity under far more unfavourable conditions, is worthy of recognition at the hands of the representatives of science. The great naturalist of our century—DARWIN—did recognise our work. His works, his arguments, are, to a very large extent, based upon the observations of the gardeners as recorded in the horticultural Press. But the botanists, and especially the rising school, seem disposed to ignore the vast body of evidence collected for them by the gardener, and which it is their business to collate and render available. The British Association should offer a means of checking this one-sided specialism.

And then take the grower: what chemist, what physicist but would rejoice if he could have the handling of so vast a mass of evidence as those that present themselves to the grower? Of course, in the garden, still less in the field, there cannot be the precision that there is in the laboratory. It is impossible to eliminate conflicting elements; it is not within our power to isolate plants as the chemist isolates the substance he wishes to investigate; but nevertheless the gardener can do and does much to lift the plant out of the struggle for existence, and to study it as it grows apart from hostile or competing influences.

The immense field for his studies compensates in some degree for the inevitable want of precision. The plant grower, in fact, is every day of his life performing or watching experiments of the utmost importance as regards plant-life. One great advantage of this lies in the fact that, in prosecuting his business, he is engaged in no mere barren brain-twisting, but he is contributing materially to the solution of the problems of life and to the welfare of his fellows, while the keener his investigation, the greater the profit to himself; so that, both from the higher point of view of the advancement of science, and the more selfish standpoint of self-interest, the plant grower is doing excellent work.

The inter-relations between vegetable physiology and practical culture are indeed numerous and weighty beyond computation; and it is time, and more than time, that the professors and representatives of horticulture should assert their claim for consideration, if not among the pure sciences, at least among those applied sciences which gave so distinguished a representative this year to the British Association in its President, Sir FREDERICK BRAMWELL.

**KEW "BULLETIN."**—The last published number (September) contains further details as to the fruit supplies of various colonies. Dominica is the nearest available fruit-producing island to the United States and Canada, and also to Great Britain. The geographical and climatal conditions of Dominica are, says Dr. NICHOLS, admirably adapted to the culture of tropical and sub-tropical fruit. The total value of the fruit exported from Dominica between the years 1881 and 1887, inclusive, was over £46,000. Dr. NICHOLS gives a list of fruits cultivated in the island in question, and other lists are given from Montserrat, St. Christopher, Nevis; the Virgin Islands and Bermuda. A short notice is added on the indiarubber trade in Upper Burmah. The catoutchou, in this case, is furnished by *Ficus elastica*.

**"BENTHAM AND HOOKER."**—M. DURAND has rendered a public service, by compiling a full list of the genera of flowering plants with their synonyms, as published in BENTHAM and HOOKER'S *Genera Plantarum*, and by incorporating the names of the genera since published up to the end of the year 1887, and by making a few changes in order to satisfy the law of priority. The genera are arranged under the natural

orders, with indications of the number of species and their geographical distribution, and in large genera of the sections into which they are subdivided. The appendix of genera of doubtful position occupies five pages—a small proportion as compared with other works. Lastly, a full alphabetical index is given, occupying no fewer than 213 pages—double column, small type. If this is creditable to the industry of the compiler, what must we say of the labours of the original authors, whose task occupied some quarter of a century? That a few errors should have crept into so vast a publication is, of course, inevitable. One such we may point out:—*Scaphespermum*, Mart., has no connection whatever with *Scaphopetalum*, Mast. (see p. 686), but it would take a very large number of similar errors to detract from the feeling of obligation which M. DRAND has laid upon all working botanists. The tabular summary works out thus:—Orders, 210; genera, 8417; species, (estimate) 100,220. It will be remembered that BENTHAM and HOOKER represent the synthetic school. If the orders and genera were computed by the analytical or “splitter” school, orders and genera would be considerably increased, while the number of species would probably be doubled.

**HORTICULTURAL EXCURSIONS.**—The projected excursion of Belgian horticulturists to the Channel Islands has been postponed till next year, on account of the bad weather. For similar reasons the excursion of the Horticultural Club had to be abandoned.

**VICTORIA PARK.**—Notwithstanding the unfavourableness of the weather, this park is still looking bright with summer flowers. Pelargoniums, Violas, Verbenas, have been very fine, but care is taken to plant only such varieties as are least affected by bad weather. Amongst the first-named may be mentioned Henry Jacoby and Bonfire. Viola Blue Boy is sometimes employed in combination with Flower of the Day Pelargonium, and whether the latter flowers or not, the effect is very nice. Mr. GINSON affects much simplicity in planting his beds of flowering plants, and with very good results. Seldom has a bed more than four different kinds of plants, and the majority have fewer than that. Golden Feather, *Echeveria secunda* glauca, *Meibomiaanthemum cordifolium variegatum*, Robert Fish Pelargonium retain their place as edging plants. A charming bed was composed of *Fuchsia Golden Treasure*, autumn-struck, and *Coleus Verschaffeltii*; but generally the plants of the latter species have grown badly. As pink-coloured zonal Pelargoniums *Cleopatra* and Mrs. Gibbons are the best this year. The carpet-beds in the scroll garden, which are prettily designed, look clean and bright, the wet weather apparently not having caused the plants to suffer much, but there is a suspicion of dulness of colour in the Alternantheras. It may interest our readers to know that of *Echeveria secunda glauca* 45,000 are bedded out; and of the pretty grey-leaved plant, *Brachyphyllum bracteatum*, more than 2000. Sub-tropical plants of most kinds have made good growth, and are quite sightly. *Lilium auratum* is largely employed, mostly to give brightness to masses of dark shrubs, or to fill the prominent angles of beds, or to stand at the junctions of walks. The Hollies—a prominent feature in this park—bristle with robust shoots and foliage, but some of them sadly stand in need of more space to develop themselves; and the turf is generally in capital trim. From what has been said it will appear that the inhabitants of the much derided Bethnal Green and Hackney districts have a beautiful and well decorated park in which to disport themselves every day of the week.

**“CHAMBRE SYNDICALE” OF GHENT.**—At the meeting held on the 10th inst. awards were made as follows:—

**First-class Certificates.**—To *Cypripedium speciosum* (niveum and Stonei), and to *C. Harrisonianum* superbum, from MM. J. Vervae & Co.; to *Odontoglossum grande superbum*, from M. James Bray;

to *Dracæna Norwoodiensi*, from M. Desmet-Duvivier; to *Maranta inconfusa*, from M. Alexis Dallière; to *Trichopilia* species, from MM. Vervae & Co.; and to new *Coleus* (seedlings of 1888) M. Paul Dutrie, Madame C. van Geert, Mlle. Rosa Rooses, Comte de Grunne, Etoile de Gand, Souvenir de Jersey, and Souvenir de Guernsey, from M. Edouard Pynaert.

**Commendations.**—To *Cypripedium javanico-superbium*; and to *Lilium auratum superbum*, from M. Bernard Spae. And a Cultural Certificate to *Adiantum Weigandi*, from M. Liévin Spae.

**IRIS RETICULATA.**—Growers have been sadly plagued with a disease in the bulbs of this lovely spring-flowering Iris. At first fungi were supposed to be the culprits, but the bulbs have been repeatedly examined at our request by the most competent mycologists of all schools without definite result. A letter from Mr. THOMSON, of Ipswich, put us on the track of mites, such as those so injurious to *Eucharis* and other bulbs. Mr. THOMSON detected some of these creatures, and this induced us to consult the highest authority in this department of zoology, Mr. A. D. MICHAEL, a member of the Scientific Committee. That gentleman, whose skill and knowledge of his subject is only rivalled by his willingness to oblige, sends us the following communication, which puts an end to the doubt as to the cause of the disease in question:—

“I took an early opportunity of examining the bulbs, they had, however, become so dry that all life was extinct in them, except the Acari; they had survived in the deeper parts of the bulbs, and were numerous, and in all stages of development. They are our old friend, or rather enemy, the *Rhizoglyphus*, but not the same species as I found on the *Eucharis* bulbs, &c.—that was *R. Robini*, this is *R. Dujardini*. I cannot of course say whether any of the other creatures mentioned by Mr. Thomson may be responsible for part of the damage, but I think I may say pretty confidently that the *Rhizoglyphus* is sufficient to account for it without assistance. The typical species of that genus (of which this is one) are true bulb and tuber eating creatures, and in my opinion are the causers, not followers, of decay. They attack sound healthy bulbs and destroy them, sometimes, when they are in sufficient numbers, by simply eating them up; at other times, when they are less numerous, either by eating essential parts of the bulb, or by making large wounds, and thus admitting water, fungus, &c. I should think the best way of preventing this evil would be, where possible, to dust the bulbs well with powdered sulphur before planting them, supposing that this would not injure the bulb, and I imagine it would not; sulphur mixed with soap and washed on is very good, but I do not know whether this might be injurious to the bulb—[probably not, used with care]. I fear that, for some years past, these Acari have been imported with foreign bulbs in great numbers, and that the injury caused by them is likely to increase instead of diminishing. I think it probable that either the Acari or their eggs are on the bulbs in most cases before they are planted. If one of your correspondents liked to send me a few bulbs before planting, I would look them over and see if I could trace any *Rhizoglyphus*; if I could not they might be planted separately in some place where no other bulbs had been grown; it would be interesting and probably useful to see whether they were attacked by the disease. It is clear that infected bulbs would be likely to communicate the Acarus to sound bulbs, whether of the same kind or not, and the Acari would be likely to remain for some little time in the soil the bulbs had been grown in. *Albert Michael.*”

**THE COLD STORAGE OF FRUIT.**—Mr. J. WRIGHT, of the *Journal of Horticulture*, reports as follows:—“At the last meeting of the committee, held on the 13th inst. JOHN LEE, Esq., presiding, examples previously placed in the chill room were examined. The temperature of this room ranges about 35°. Figs, quite ripe when placed in store on

August 30, had kept surprisingly well; the dark coloured fruits appeared quite unaltered, but two of the lighter coloured were spoilt. Plums, stored at the same time, were as good as ever. Of a dozen outdoor Peaches, eight were in good condition, two fair, and two spoilt. Peaches and Nectarines grown under glass, from Messrs. RIVERS & SONS, also Oullin's Golden Gage, placed in store at the same time (the 30th ult.) were in fine condition. Peaches from Messrs. CHEAL & SONS, stored on August 31, were in good condition, but a Melon put in with them was spoilt. Bradshaw Plums from Chiswick, placed in store at the same time, were unaltered, but Tomatos, except a few yellow fruits, were spoilt. This is the second failure with Tomatos, which do not appear to be able to endure the cold. Many of the Cherries—a bad sample, stored wet on August 8—were still sound, and it was thought that those which failed were crushed or injured at the outset. It is the opinion of the committee that for keeping purposes the fruit must be sound. Some of the Cherries (red) in the freezing-room (temperature 21°) were quite hard, others (black) were yielding to the touch but frozen inside. Some Cherries taken from the chill room a fortnight ago and steadily thawed were good and well flavoured the following day after a cool sojourn of twenty-three days, and there are doubtless others that have now been in the chamber forty days equally good. Can any northern friends oblige by posting a few Gooseberries and Currants to Mr. D. TALLERMAN, Cold Storage Co., Leadenhall Market, 70½, Gracechurch Street, London? They will be gladly accepted and fairly tried. The fruit should not be over-ripe, and care should be taken to pack them so as to arrive without being bruised. Peaches are best enclosed in tissue paper before being packed in boxes with wadding. All fruit is best stored in closed boxes as if for transit, as when exposed Cherries at least lose their bright fresh colour, and it would probably be the same with other fruits.

**IXORAS AT GUNNERSBURY PARK.**—A house of these is just now a remarkably attractive feature at Gunnersbury Park. The centre stage of a large house is filled with fine young bushy plants of *Ixoras*, mainly of coccinea, with a few of *Morsei*, *Westii*, and *Williamsii*. The plants are from two to five years old, and are blooming with great freedom. From these plants Mr. ROBERTS has been cutting freely since April, and the plants break into growth at various points below where the flowers were cut away.

**THE ROTHESAY CLIMATE.**—While the country generally, says the *Scotsman*, of September 18, “has been complaining of the lack of sunshine, Rothsay, ‘the Brighton of Scotland,’ would almost appear to have had more than its share. A few days since Mr. PRITZ, of the Glenburn Hydropathic, showed in Edinburgh two beautifully ripe Figs—one weighing 2½ oz.—which had grown in the open air on a standard tree with a southern exposure at the Hydropathic. The Passion flower is just bursting into bloom, also in the open air.”

**MUTINUS BAMBUSINUS.**—Under this name Dr. M. C. COOK describes and figures, in the last number of *Grevillea* a fungus of striking appearance but filthy odour, allied to our common Stinkhorn (*Phallus impudicus*). The singular thing about the *Mutinus* is that it is a tropical species, native of Java, where it grows at the base of Bamboo clumps, and yet that it made its appearance in Mr. NOBLE's nursery at Sunningdale amongst some young Plum trees.

**BRAMBLES.**—Mr. VERTEGANS sends us flowers of the double rose-coloured Bramble, evidently a variety of *R. discolor*, and which is very beautiful and effective in wilderness walks and similar situations. The double white is even more floriferous, and looks like a form of *R. corylifolius*. Some years since we gave illustrations of these hardy and beautiful shrubs, which we were glad to find attracted as much attention at the time as the representations

of the most costly Orchid. Rose Queen has small rose-coloured flowers, succeeded by rose-coloured berries. Golden Queen Raspberry is a free white fruiting variety of good flavour. Rosa Pissard, also sent by Mr. VERTEGANS, is a very free-flowering, single-flowered Rose, somewhat in the way of *Felicité Perpetuel*, and of which we may have more to say on another occasion.

**TULIPS.**—We learn from the *Kelso Chronicle* that in view of the imminent revival of the florists' Tulip Messrs. STUART & MENN have just completed the purchase of the famous collection of Mr. DAVID BARBER, Stanton-le-Dale. The collection contains several thousand bulbs of the best varieties in existence, many of them never having been offered for sale to the public. Mr. BARBER, who has several times won the Champion Cup and other prizes open to all England, is one of the last of his generation of enthusiastic Tulip growers. He is upwards of seventy-three years of age, and for a period of upwards of forty-three years he has gathered together and grown his favourites. It is satisfactory to record that this famous collection has come to Scotland, and we are sure that nothing will be left unaccomplished that skill and enterprise can do to make the collection equally famous in that country.

**TOMATO AND POTATO DISEASES.**—One form of Tomato disease is known to be identical with that of the Potato, and in the South of France sulphate of copper is in general use among the large growers of Tomatoes. The success of their treatment induced M. PRILLIEUX to try the effect on Potatoes, leaving others side by side untreated. An early variety was seen to be affected on August 5, and at once treated with a solution of sulphate of copper of the following strength:—6 parts of sulphate of copper, 6 of lime, 100 of water. This liquid was applied to both sides of the foliage and to the haulm with great care with a spray pump. Ten days later (August 16) the tubers were lifted, with the following result:—

	Number of Tubers.		
	Healthy.	Diseased.	Percentage of diseased.
Nine plants sprayed...	115	...	...
Six plants not sprayed ...	53	17	32·07

This experiment should be repeated another season at Chiswick and elsewhere. It is hardly likely that with the necessarily rough-and-ready procedures of the grower on a large scale the same good results will be obtained as by M. PRILLIEUX experimenting on a small scale with scientific precision; but supposing only half as good a result were obtained, the advantage would be great. The record of M. PRILLIEUX's experiments was presented to the Paris Academy of Sciences, and published in the *Comptes Rendus*, August 28.

**CHISWICK GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—This body of young gardeners of the Chiswick district, being desirous of affording tangible assistance to the Gardeners' Orphan Fund, proposes to hold, on October 17, a *soirée* for gardeners and others interested in gardening at the Chiswick Vestry Hall. The *soirée* will comprise music, reciting, and exhibition of objects of interest. Tickets of admission, 1s. each, may be obtained on application to the Secretary, Mr. J. BARRY, or at Messrs. PLATRIER & SONS, Post Office, Chiswick. The *soirée* will commence at 7·30 P.M., precisely.

**MEXICAN BROOM-ROOT OR WHISK AND IXTLE FIBRE.**—This material, which was referred to in the *Gardeners' Chronicle*, vol. ii., 3rd series, p. 104, as being probably furnished by a species of *Boutelous*, but which has since been proved, in the *Kew Bulletin* for December last, to be produced by *Epipactis macroura*, Benth., is said, in a report on the trade of Vera Cruz for 1887, to have fallen off consider-

ably in the quantity exported, the value of which was £58,632, in 1886, and £45,122, in 1887. "This decrease," it is said, "may be accounted for by the crude process at present employed of preparing the root for the market, which is not only expensive, but has the disadvantage of injuring the fibre, so that it reaches the market shorter and less viry than it should, but the employment of machinery for preparing this *raiz de zacaton* promises to become general, and then the quality of it will be higher and the price probably lower, so that it will no doubt regain and increase its market." In the same report from which the above is taken, the export of Ixtle fibre (*Agave heteracantha*) is stated to have become nominal, though it promised to assume important dimensions. The cause of this falling-off is similar in this case to that of the Broom-root. It is intended to introduce the preparation of this fibre into a new penitentiary, which is to be fitted up with adequate plant and machinery, and this it is thought will be the means of making the Ixtle fibre become a profitable industry, and so confident is the State Government of the value of Ixtle that they are about to offer a premium of 3000 dollars for the best machine for rendering it marketable.

**PUBLICATIONS RECEIVED.**—*Annual Report of the National Chrysanthemum Society.*—*Agricultural Statistics, Ireland, Acreage under Crop, and Number and Description of Live Stock.*—*Report on Macuarieballi (Forsteronia gracilis), a new Indianrubber Plant in British Guiana.* By G. S. JENNMAN, Botanic Garden, Georgetown, Demerara. — *Report on the Botanic Garden, Georgetown.* By G. S. JENNMAN.

## SCOTLAND.

### ARDGOWAN.

THIS princely seat of Sir Michael Shaw Stewart, Bart., is situate about 15 miles from Bridge Street Station, Glasgow. Inverkip is the nearest railway station, and a brief walk through the village of that name brings the visitor to the entrance gates on that side the park of Ardgowan. The park is of large extent and well wooded, the planting having been done with rare skill in the development of the beautifully undulated surface. The object of my visit being to inspect the famous gardens, and my time limited, I had little opportunity for observing the beauties of the park itself. It was impossible, however, even in the rapid run over the limited portion of the place which was traversed in reaching the different points of gardening interest to omit noting the magnificent landscape around, views of which are commanded from the higher ground within the park. The site of the mansion has been admirably chosen in relation to the surrounding scenery. Views of the beautiful scenes of this lovely part of the Clyde are obtained from many points from the top of a lofty tower on the shoreward side of the lawn; additional range and variety of feature increase the admiration of the spectator.

The lawn surrounding the mansion is perhaps the most perfect in all respects I have ever seen. It is of considerable extent, and furnished with choice Rhododendrons and ornamental deciduous flowering evergreen trees and shrubs. A charmingly reposeful place it is as viewed from the windows of the mansion, and from the terrace which extends along the front of the latter. On this terrace a pretty geometric garden is laid out, and among the plants employed, I noticed an almost lost old favourite in *Pelargonium Tom Thumb*, which has this season beaten the newer varieties in floriferousness, and certainly has never been surpassed in the brilliant tone of scarlet its flowers possess. Mr. Lunt stated that it is the best bedding *Pelargonium* for the district. Among the shrubs trained on the lower part of the house is a fine healthy plant of the Myrtle, which was reared from a slip drawn from the marriage bouquet of the

present Baronet. It has been several times cut down by frost in exceptionally severe winters, even though it is carefully protected, but it always starts bravely away again from the roots. A handsome conservatory is well filled with the usual kinds of flowering plants, some luxuriant tree Ferns, Palms, and climbers.

### THE KITCHEN GARDEN.

IN which are the extensive ranges of fruit and plant-houses, lies in an admirably sheltered space to the south-west of the mansion, and at a considerably lower level than the latter. Shelter from the north is perfect, and the exposure to the south equally so. It is a walled parallelogram, and its greatest length ranges east and west. The vineries and houses for Peaches, Figs, and plants, are built against the north wall, are lean-tos of ample dimensions, and well constructed. Evidence of Mr. Lunt's skill as a cultivator confronts in every department, but in fruit culture he is in the front rank. Such Muscats, such Black Hamburgs, Lady Downes, Madresfield Court, Mrs. Pince, and Black Frontignan!—these are all the varieties grown—are worth a long journey to see. The Vines are twenty-three or twenty-four years old, and were planted by Mr. Lunt. The borders are of pure loam, without any admixture of other material.

Given good loam and perfect drainage, which latter was Mr. Lunt's first consideration in making his borders twenty-four years ago, and there appears to be little reason for all the fussy dicta that have been insisted upon on the subject of making Vine borders during the last quarter of a century. The broad, massive, leathery leaves on these Vines, and the magnificent clusters of plump, luscious berries, point a lesson, if not a moral, on the subject. The black Frontignan is a favourite with Lady Shaw Stewart, and a Vine of the variety is grown in each house.

**Peaches and Nectarines.**—Of these there are found a limited number of varieties, which are well chosen. Sea Eagle was the only variety of Peach bearing at the time of my visit, and its fruits were plentiful and good. One tree of Royal George, occupying a space of 25 or 30 feet by 18 feet, is furnished with fruiting branches in every part, and it is without exception one of the best examples of tree management that has come under my notice. It is twenty-four years since it was planted by Mr. Lunt, and he only has attended to its pruning.

**Figs** are much liked and are largely grown. One house, 84 feet long, is entirely filled by two magnificent old trees of Brown Turkey. Their age is not known, but they were old when Mr. Lunt's predecessor took charge of Ardgowan Gardens, thirty-six years before his superannuation twenty-five years ago. The second crop was just coming to an end, but there were some good fruit still remaining.

In one of the Peach-houses my attention was drawn to a large plant on the wall at the back of the house of *Lapageria rosea*, with a history. It is one of many seedlings raised twenty-five years ago by Mr. Collinson, the then gardener to Eaton Hall, Chester, who was the first to flower and fruit the plant in this country. It is a very large plant, which covers a large space and is blooming freely.

Of plant-houses or convertible pits there are several ranges consisting of four divisions, each 36 feet long—excellent samples of what such houses should be. At present some of them are filled with healthy plants of *Azalea indica*, *Calanthe Veitchii* and *C. vestita*, both well done, the former species having pseudobulbs of great size; another division is occupied with cool Orchids and Ferns, some are filled with Melons, Cucumbers, others with Tomatoes, the three latter being grown in pots, and very successfully. McIndoe's Best of All and William Tillery are the only two kinds of Melons grown. Large numbers of decorative plants are grown, and flowering plants for cutting in winter, these being much wanted for that purpose. Strawberries in pots throughout winter and spring are a specialty for which two of these large span-roofed pits are set apart.

The hardy fruit crops are short this season, but vegetables have been and are good.

No one visiting Ardgowan we feel sure will be disappointed. It is under competent management, and is a place of large extent, whose proprietor takes a pride and pleasure in having everything maintained in first-rate order. S.

## GRAPE GROWING FOR MARKET, IN BELGIUM.

Any horticulturalist who may chance to visit the beautiful capital of Belgium should not miss seeing the immense vineries at the village of Hoeilaert. This village is situated about 8 miles south-east from Brussels, and is easily reached. You take the train from the "Station de Luxembourg" for a small station called Gronendael, which journey occupies only from ten to fifteen minutes. The remainder of the journey can easily be made on foot, and the walk between the latter station and Hoeilaert is exceedingly pleasant, the road running for the greater part of the way through a beautiful forest of Beeches, which throw their branches across the roadway, making an agreeable shade. The country here is, I think, the prettiest in the environs of Brussels being gently undulating and finely wooded. In passing from Brussels to Gronendael you see a neat village which is known by the name of "La petite Suisse" from its fancied resemblance in miniature to a Swiss hamlet.

The village of Hoeilaert is also prettily situated, and, as an example of a Flemish village, is worth a visit even without the attractions of the vineries. When the village is reached it is a most interesting and curious sight to look round upon the immense ranges of glass, with the sun's rays reflected in dazzling gleams from their glittering surfaces.

In this country we are accustomed to see glass structures situated in enclosed areas, but at Hoeilaert they are simply built in the open fields, without walls or fences round them, the situations being chosen more with regard to the suitability of the soil than anything else. You can walk off the public highway across a field and straight into ainery, without having to pass any barriers whatever.

In 1865 the Brothers Sohie started the first Vine-growing establishment in Hoeilaert, and now there are no fewer than sixty following in their footsteps, the system of culture employed, and the style of house being, as a rule, similar with all. The usual form of house is a span-roof, in the Dutch style. Almost the only exception to this are the original ranges built by the Brothers Sohie, which, being on a somewhat steep slope, are half-spans, which form of house accommodates itself much better than a full span to the fall of the ground, the ranges rising one above the other, like a series of terraces.

In the establishment which I looked over there was one block of twenty-four houses, each house 75 feet long, 30 feet broad, and 10 feet high. A second block, separated from the former by a roadway, was composed of ten houses of the same dimensions, and there were in addition three or four detached houses, placed at right angles to the main blocks, for the culture of Peaches, &c.

There is a wood framework, which forms the skeleton of the house and supports the iron astragals and glass. The astragals are of light T-iron, and are carried right over the ridge from wall to wall in one piece. Ventilation is obtained by sashes hinged to the ridge-piece, these being lifted by a simple iron rod. In each house there is a large circular concrete tank into which is carried the water off the roofs.

The heating apparatus is of the most primitive and simple description, being composed of flues of large glazed drain-pipes, placed on the ground, the chimney or chimneys also of pipes generally passing through the glass in the centre of each house. I certainly did not admire the system of heating, it seemed so clumsy, there being in the large houses four furnaces, two at either end, which must entail enormous labour and trouble, when one thinks of the very great number of fires required in a large block.

A little more ingenuity might also be exercised with regard to the positions of the chimneys, as I could not but think that a more suitable place might be got for them than the exceedingly makeshift-looking expedient of pushing them right through the

centres of the roofs. As yet no one seems to have tried to step from the beaten track and make a new departure on the system of heating, as in all the establishments it is the same.

The vineries, however, are well built and substantial, being put up on the simplest and least expensive way consistent with efficiency. Very little attention is given towards keeping them tidy, which detracts considerably from their appearance. No time seems to be available for tidying up, economy in this as in all the other details being rigorously practised. The Vines are planted in four lines, at about 3 feet between the plants. Heavy cropping is the rule, the bunches averaging about  $\frac{1}{2}$  lb. in weight. The berries are well coloured.

Until quite recently, the chief, indeed the only variety grown, was the Black Frankenthal, but now some of the new houses are being planted with Black Hamburgh, Black Alicante, &c.

In some cases the Vines have been planted in position two years before the vineries they were destined to fill were erected, the houses being built over them—rather a change from the usual process.

In a pamphlet published in the beginning of the present year by M. Ch. Joly, of Paris—*La Culture de la Vigne sous Verre*—a description is given of the vineries at Hoeilaert and of the famous establishment of the Messrs. Thomson at Clovenfords, near Galashiels. The vineries at Hoeilaert, like those at Clovenfords, are certainly very important commercial establishments, but there is little or no similarity between them with regard to the system of culture, or to the construction of the houses.

Any one who visited the first vineries at Clovenfords, and afterwards compared this magnificent establishment with the vineries at Hoeilaert would get a very great surprise. At Clovenfords one sees large and handsome houses heated with hot-water on the most approved principle, the whole culture of the Vines being of the highest excellence, and the result being Grapes which for size of bunch and finish compare favourably with the highest class Grapes from any private establishment.

At Hoeilaert, on the contrary, you have a different state of matters—rough houses and a very rough-and-ready system of culture, with a result of small bunches and berries. In truth, the Belgian establishments should not be named vineries, as we understand the term, but a vineyard under glass. When I visited Hoeilaert, at the end of May, a large part of the Grapes were rapidly colouring, a second series were just set, and a third showing the bunches. These Grapes are sent to many of the large cities, the principal being London, Paris, Brussels, Berlin, and Amsterdam.

In addition to the Vines, Peaches are also grown to some extent, the chief varieties being Madeleine Rouge. Strawberries form another auxiliary product, considerable quantities of these being grown, some in pots and others planted out in beds on the inside viney borders. The chief Strawberry grown is *Marguerite Lebreton*. *James Wilson, Jun., Greenside Nursery, St. Andrews, N.B.* [Ainery constructed and heated as above described was figured at p. 275 of our issue for March 3 last. Ed.]

## VEGETABLES.

### CHOU DE BURGHELEY.

MUCH has been said and written for and against this; but those who have done the latter little know how useful and valuable it is, as those who have condemned or found fault with it must, I think, have had it in use at the wrong time, if that be possible, for during late autumn and in winter Cabbages and Savoy are quite out of it, and will not compare with Chou de Burgheley in any way for delicacy of flavour, and for the seasons mentioned I am of opinion that it ought to quite take their place. Again, if we turn to the spring, we all know that Cabbages cannot be had fit to cut very early, but with Chou de Burgheley

sown towards the end of July, or before, and planted out in good soil as soon as the plants are fit and large enough, they are ahead of Cabbage, and no epicure can find fault with them if properly cooked, as they eat like the tender heart-leaves of a Broccoli or Cauliflower, and nothing else on this head need be said in their favour. Here we have them in all the different stages, and shall not be without a supply from the end of October till April or May, when Chou de Burgheley will be succeeded by Ellam's, Veitch's, and Etampes Cabbages, which are my favourites, as they are early and quite large enough. *J. Sheppard.*

## THE BULB GARDEN.

### BLIND NARCISSUS POETICUS.

I HAVE followed the correspondence on this subject with considerable interest, as the opinions expressed vary so greatly. The theory about shallow planting I do not consider to be tenable, as the growth of the bulbs I have in my garden disproves it. I referred a few weeks ago to the fact that the bulbs in my brother's garden on a similar soil, and only a few yards away, though taken from my stock, always go blind, whilst I have hardly an instance of such failure. If shallow planting were the cause of the mischief, the condition would be reversed, as mine are the shallower of the two; indeed, during the winter I had serious fears that their being so near the surface—some barely covered with soil—would be detrimental to their growth and flowering this season. The result proves that practically it has had no such effect. The border where I flower my bulbs has full exposure to the north-east winds, and is rarely protected by snow, owing to the wind sweeping through an adjacent gateway, and it does not get the early morning sun, as on the south-east it is flanked by a low Laurel hedge, from 2 to 3 feet high, so that during the winter and early spring it gets no sunshine until 10 or 11 o'clock. On the other hand the non-flowering bulbs in my brother's garden have exposure to the sun during the early morning, and also through most of the day, and are sheltered from the north and east by walls. I am unable to hazard an opinion as to the real cause of this blindness, but am satisfied that the shallow planting and frost theory is not the true solution. *D. J. Ve.*

### LILIUM CANDIDUM.

This Lily in many places refuses to grow, or is at best difficult to keep, as not only do some soils seem to disagree with it, but the plants are subject to a kind of fungus, and this, when it attacks them, soon sweeps them all off. Of remedies to stop or cure it there appear to be none known at present,—at least I have not heard or read of any—but if there are, those who have knowledge of them would do a good service to many by stating them, as it is a real loss to any garden to be without such an old favourite. [Try sulphate of copper.] Here, and in this district, no one has the least trouble with it, as not only does it succeed well in our borders, but it may be seen in those of almost every cottager, and in some in such strength and luxuriance that the stems run up to a height of 5 or 6 feet, and bear a great number of flowers. As to the bulbs, it seems to be a struggle with them as to which shall keep possession of the ground, for so thick and crowded do they become that they lift and push one another out, and it is quite common to see many lying bare on the surface if the clumps are not frequently divided and replanted, and in doing this it is always advisable to give them a fresh place or new soil.

The land about here is light and sharp, and as the bottom is gravelly or sandy, it drains quickly, and this may be the whole secret of the success of this Lily, as most bulbs that remain continually in the earth need dryness when at rest, and Lilies, perhaps more than others, require that condition, as they have so much surface exposed owing to their numerous scales, and moisture is very apt to lodge between

these and cause them to rot. If, in cases where it is difficult to keep them, the bulbs were taken up for the winter, they would most likely succeed *J. S.*

## USEFUL INVENTIONS.

Messrs. CHEAL & SON, Lowfield Nurseries, Crawley, have lately introduced a novel flower-holder, which is very suitable for use in staging flowers at exhibitions. Fig 44 is an illustration of a frame which is constructed to carry ten blooms, the stalks of which are pushed through the loop, and led down the centre stem to the water-tube in the box; another form is made with the water-tube joined on, and the frame may be then used for hanging on walls, &c., for decoration. Visitors to the more recent meetings of the Royal Horticultural Society at Westminster will remember having seen these frames used for Dahlias, in which way the single varieties are displayed to advantage.

## FRUIT REGISTER.

### LE LECHER PEAR.

This is a seedling between Williams' Bon Chrétien and Bergamotte Fortune, raised by M. A. Lesneur, of Ypres, and recommended in the *Bulletin d'Arboriculture* as one of the best winter Pears. The fruit is large, pyriform, yellow, spotted with drab spots; stalk short, eye shallow, flesh white, juicy, sugary brisk, and perfumed, free from concretions. Season, from January to March. The Pear is sent out by MM. Transon, of Orleans.

### STRAWBERRIES.

M. Burvenich describes and figures in the *Bulletin d'Arboriculture* for September some new Strawberries. 1, Cerberus, is a seedling from Sir Joseph Paxton, and produces Cockscomb-like three-lobed fruit; 2, Madame Frederick Burvenich, a conical fruit, of fine appearance; 3, Jean Marie de Smet, a seedling from Louis Vilmorin, and a large Cockscomb variety. All three are recommended by a highly competent and judicious authority, M. Burvenich.

## PENTAPERA SICULA.

It seems rather surprising that Messrs. Betham and Hooker should have retained this genus as separate from Erica, when the only difference appears to be that the parts of the flower in true Heaths are in fours, while in this Sicilian representative they are in fives. *P. sicula*, a native, as its name implies, of Sicily, is a low-growing shrub, with fine hoary leaves, and pale pink flowers of a globose form. The plant is very rare in gardens, though figured long ago in Link and Otto's *Icones*, i. t. 19. Our illustration (fig. 45) was taken from a plant in the Royal Gardens, Kew.

## THE FLOWER GARDEN.

**MIXED BORDERS.**—At this time of the year these require to be looked over frequently, if they are to present a well-kept appearance. Work of a routine character in them will consist of keeping down weeds and in cutting off dead stems and leaves from plants that have flowered, in clearing away hardy annuals as they go out of bloom, except where seed is desired. See that all flowering plants of *Chrysanthemums*, *Michaelmas Daisies*, *Pyrethrum uliginosum*, *Helianthemums*, and others, are kept securely fastened. Where the re-arranging of borders will be carried out during the ensuing autumn and spring, the present is an opportune time for taking notes of height, colour, habit of each species, putting these particulars on a label. Likewise transplant seedling Foxgloves.

**Common Shrubs.**—The propagating of many of these may now be proceeded with, in the case of *Acubas* by cuttings, *Rhododendrons* by layering.

Choose a well-drained border for cuttings, and a light sandy compost should, if possible, be used about the cuttings. After putting them in, press them down quite firmly. Conifers, and many evergreen subjects, are best rooted in sandy soils on a shady border under hand-lights, or in pots in cold frames. The planting season is fast approaching, and where much work is contemplated, the requisite materials must be got in without delay. If peat or loam comes from a distance, push forward the cartage of it while the roads are in good order. Let the nurseryman have orders for the delivery of planting stuff, or, what is better, go to the nursery and make your own choice, in which case select young free-growing shapely plants in preference to old ones, which rarely do well.

**Carnations and Pinks.**—Those that were layered early are now rooted, and should be cut off and planted either in narrow beds or in borders, using a compost of fibrous loam and leaf-mould about the plants. The soil round about the roots should be made quite firm in planting. For late layers a fortnight or three weeks hence will be early enough in most parts of the country. Nothing is gained by planting with few roots. *J. Horsfield, Heytesbury.*

## HOME CORRESPONDENCE.

**NATIONAL FRUIT-GROWERS' ASSOCIATION.**—I imagine that the correspondent whose interesting letter is quoted in the article on p. 270 of the issue of

FIG. 44.—CHEAL'S CUT-FLOWER HOLDER.

September 8 last has not read his *Chronicle* of late days very carefully. This will be seen on comparing his remarks with the matter of two articles on pp. 61 and 186, where the whole subject under consideration seems very fairly considered. Perhaps your correspondent will kindly refer to the articles in question: what appears to be original in his letter is the project of a society under the above title. But why a fresh society, when we have, or are in process of receiving, a rejuvenated Royal Horticultural Society? There seems to be a great desire to break up the bundle of wood into distinct sticks; but surely this is wrong. Perhaps the old Society is greatly to blame for the weakness of the central point of attraction—certainly some sign ought to be given during the coming autumn and winter by which the degree of vitality in it could be measured. All local societies—fruit, vegetable and flower—should be gathered under its maternal wing, and some kind of union effected between this great organisation and the great representatives of arboriculture and agriculture. But I need not repeat what has already been published in your columns in the pages above noted. It is pleasant to note that English resources and requirements are receiving, at last, fitting consideration. *Old Crab.*

**THE JARDIN DES PLANTES.**—The paragraph on "Origin of Botanic Gardens" (*Gardeners' Chronicle*,

p. 243) should have had "in Paris" added to it, since it is a little misleading as it stands. The Oxford garden was made about the same time as the Jardin des Plantes, but there were at least four other botanical gardens established on the Continent at an earlier date, viz., Padua, 1545; Montpellier, 1558; Leyden, 1577; and Leipzig, 1580. Our own John Gerard and Jean Robin were contemporary proprietors of private botanic gardens, and Robin paid Gerard a visit in London prior to the publication of the *Herbal* in 1597, in which he tells us Robinus sent him the pale double Daffodil (= *N. eystettensis*) "from Orleans and other parts of France"—a statement quoted by John Parkinson in his *Paradisus* of 1629. This has long been popularly known as "Queen Anne's Daffodil," and seeing that Robin introduced it to England, it seems very probable that he or his contemporaries so named it after Queen Anne of Austria, the Queen of Louis XIII. *F. W. B.*

**NEW VARIETIES OF CABBAGE.**—I beg to thank "A. D." for his reply to my query, regarding Little Gem Cabbage, and at the same time assure him I had my seed of that variety direct from Sutton & Sons. I certainly only grew a limited quantity—about 150 plants of each variety—but I think it would be easier to detect any variation in that quantity than if the plot had been larger, as the soil would be more uniform in quality. The seed of Little Pixie was not, however, from that firm, and in that probably lies the difference, if Little Gem is a selection from Little Pixie, as selections cannot well be made without deterioration of stock. I have known Little Pixie about twenty years, and I think I can detect a little difference in what I grow now to what it was then, in that the heads appear to be broader at the base, and not quite of the same green colour, but the main characteristics are the same, viz. its extreme earliness, compactness, and mild flavour. I think if "A. D." were a practical gardener he would hardly be surprised to find one variety of vegetable, under two names in the same catalogue, as, I am sorry to say, it is often the case, now selections have become so popular with our great seedsmen. I fear the great advance in garden produce spoken of by "A. D." is rather chimerical, as I fail to see, in looking over collections of vegetables at our shows, any very great advance on what these were twenty years ago. I certainly was struck with some New Intermediate Carrots I saw at Shrewsbury the other day, but they were very much like Long Red Surry; but perhaps the difference was so infinitesimal I could not discern it. In conclusion, selections are, as a rule, very good; but when sent out as a distinct variety they soon revert to the old type in the hands of other seedsmen, hence so many synonyms and so much disappointment. *John Wilkes, Creswell Hall Gardens, Stafford.*

**EARLY SPRING FLOWERING CROCUSES.**—Amidst a great wealth of early spring flowering plants in the hardy flower garden, the numerous species of Crocuses now in cultivation hold a foremost place. We usually grow a group of some forty species and varieties under glass, not forcing them in any way, and they are certainly very charming. Whether cultivated in pots, so that they can be placed in a cold pit or frame, or planted out to be protected by some temporary glass appliance, they are worth all the care that may be required to maintain them in vigorous health. If planted out it is worth while to make the soil suitable for them. A mixture of loam, decayed manure, leaf-mould and sand suits them admirably. Plant them about 2 inches deep. They are all hardy enough, but should be protected in some way. *J. Douglas.*

**TRITOMA UVARIA** are now in full bloom here, and many plants have sixty fine spikes, which make very grand display. The plants stand in the clumps of the *Rhododendrons*, on the edge of a lawn. The mixture of peat and leaf-mould of the beds suits them well, and they stand the weather without any protecting. I also plant *Anemone japonica*, the red and the white varieties, and varieties of *Gladiolus*, amongst the *Rhododendrons*—an arrangement which has a pleasing effect when the *Rhododendrons* are out of flower. *W. Smyth, Basing Park, Alton.*

**CRACKING OF BLACK DAMASCUS GRAPE.**—After promise of a good crop of Black Damascus Grapes, I find the berries, just half coloured, cracking in such numbers that the crop is practically spoiled. I believe this Grape has a bad reputation for cracking, but is there any one fault of cultivation to

which it is attributed, or is there any means of lessening the loss? *W. T. B.*

**DEATH OF TREES.**—All round this neighbourhood, and in my own garden, there has been a curious fatality among Mountain Ash trees of from five to twenty years planting; the trees after setting the berries have in a few days withered up entirely, while like neighbouring trees are in full health. This fatality has extended to the Silver Birches, also causing serious gaps in rows of trees. Have you any similar complaints from any other quarters [yes], and what can account for it in any way? *W. T. B.* [We shall be glad of further information. *Ed.*]

**LONG-LIVED CUCUMBERS.**—Whilst at Belton Park, Grantham, recently, I was somewhat surprised to see a fine house of Cucumbers planted last August bearing fruit as freely as any spring-planted one could do. This is by no means a common occurrence;

allowed to become stagnant by overwatering, failure is inevitable, while if kept too dry the result is equally bad. *C. Collins.*

**TEA ROSE HOMER.**—There are few Tree Roses so hardy and enduring as this, for, without the slightest protection, it stands year after year, and does not suffer from frost except that, now and then, during severe winters, a few of the soft shoots killed get back at the tips. We have a plant here in the school garden that has stood out for over ten years, and which is a large bush, standing from 6 to 7 feet high, and as much through. This plant never has any other pruning than what it gets from having some of its flowers cut, and the quantity of these it annually bears is surprising. Many of the blooms were deformed. This is characteristic of Homer, but as every one knows, who is acquainted with this useful old Rose, the half-expanded blooms, when they are perfect,

**A LARGE IRISH YEW TRANSPLANTED.**—I have succeeded in removing at Little Kimble, Buckinghamshire, a specimen of the above species about 50 feet in height, and 24 paces in circumference. The diameter of the stem at the ground level is 2 feet 9 inches. Another tree which I have also transplanted is an Arbor-vita whose stem is 2 feet in diameter. The Yew it is calculated is about 300 years old. *J. Robinson, St. Mary's Square, Aylesbury.* [Will our correspondent kindly say where these trees are to be seen? *Ed.*]

**THE "WEATHER PLANT."**—When scanning the columns of a daily paper lately, my eye chanced to alight on the following interesting paragraph:—

"THE WEATHER PLANT.—That remarkable specimen of the vegetable world, the 'weather plant,' continues, says a Vienna correspondent, to excite considerable interest there. Men of science who, on its first discovery, were unwilling to express an opinion on its prognosticating virtues, now agree, after extensive experiments, that the shrub is, in truth prophetic. Thirty-two thousand trials made during the last three years tend to prove its infallibility. The plant itself is a Legume, commonly called the 'Paternoster Pea,' but known in botany as the '*Abrus pergrinus*.' It is a native of Corsica and Tunis. Its leaf and twig strongly resemble those of the Acacia. The more delicate leaves of its upper branches foretell the state of the weather forty-eight hours in advance, while its lower and harder leaves indicate all atmospheric changes three days beforehand. The indications consist in a change in the position of the leaves and in the rise and fall of the twigs and branchlets."

This paragraph seems to have created a desire on the part of some people to possess such a wonderful plant, as numerous applications for seeds of *Abrus pergrinus* have been made to Kew. There can be no doubt but that the correspondent of the paper mistook the word "*precatorius*" for "*pergrinus*," and adopted the latter word on the probability of its being the correct one. In the *Gartenflora* for September 1, 1888, there is an article bearing on this subject, entitled, "*Abrus precatorius, eine Wetterpflanze*," of which I have made the following translation:—"In the spring catalogue of a firm now established at Prague is the figure of a plant of the Mimosa tribe, known as the 'weather plant,' and offered at a high price. This plant not only foretells the state of the weather two days beforehand in its immediate vicinity, but also for some miles round, and is even able to predict the approach of earthquakes. A young man named J. Novak, in a country nursery in Bohemia, received the seeds, he said, from a sailor. In the summer he took a plant to Vienna, but not being able to find a place where he might leave it for observation, took it back with him. At the last meeting of the Imperial Horticultural Society, he exhibited it, when the Emperor saw it, and purchased two plants. Later on, it was shown at a trades' exhibition, when its properties and peculiarities, confirmed by some burgomasters and similar officials, were commended to the public. A good plant, capable of indicating all kinds of weather and temperature, was priced at 140 marks (nearly £7), including the case in which it was grown, and a pamphlet containing instructions worth about 10 kreuzer (about 1½d.), at 1 gulden (about 1s. 8d.). No one there knew what the plant was. And what was it after all? Simply nothing but an old acquaintance in the form of *Abrus precatorius*, the movements of whose leaves at morning, noon, and night, have been known for a century, and whose seeds scarcely cost a farthing, but are sold by the firm for 5 florins each. We do not at all doubt that the heat of the atmosphere and moisture may exercise an influence on the leaf movements of this plant, but to try and interpret such minute changes into weather predictions is probably only on a level with the slight botanical knowledge with which the discoverer of this little deception is endowed. Gardeners here can obtain a plant for about 50 kreuzer (less than 1s.), but will consider it a treasure scarcely worth possessing, as it requires great heat for its cultivation. Besides, the plant has become remarkably quite recently, as it increases the number of poisonous Leguminosæ already known. Its brilliant shining scarlet seeds with black spots, which are used for necklaces and rosaries, contain a virulent poison, which one understands is used for killing in India." *J. Weathers, Royal Gardens, Kew.*

**WRINKLED PEAS.**—It seems very probable that the cold wet weather in addition to materially inducing much of the later bloom on wrinkled Marrow

FIG. 45.—PENTAPETALA SICULA: FLOWERS PALE PINK. (SEE P. 334.)

in fact, gardeners often find a difficulty in keeping Cucumber plants in healthy condition throughout the winter. The plants referred to grew in a border 3 feet wide, 13 or 15 feet long, and about 2 feet deep; thus it is obvious that winter Cucumbers are not always best when their roots are cramped for room—notwithstanding that such is the method usually adopted. They were, I was informed, raised from seed sown in the usual manner about the end of July last year, and planted in the borders, which were well drained, towards the end of August. No extra attention has been bestowed on them beyond an occasional top-dressing with good loam and manure, and a good soaking with liquid manure when making growth and in full bearing. Undoubtedly the secret of such an achievement as this is in keeping the plant healthy, and this can only be done by a free use of the syringe and judicious use of the watering-pot. During the winter the greatest attention must be paid to the latter point, for if the growth be

are most charming. It is, I think, a great mistake, where numbers of flowers are required, to prune in the way many do, and especially so with Teas, as when plants are left to themselves they soon form fine heads and a rich harvest of bloom. *J. S.*

**ASPARAGUS TENUISSIMUS.**—I noticed that Mr. Smeeth has sent you a spray with flowers, and you add that you do not remember to have seen it in flower before. I should like to state that I have a plant which has bloomed two or three times a year for several seasons past, and is now in bloom. It has produced seed, and I have been successful in rearing plants from it which are now about 1 foot high, very bushy, and make nice plants for the table. The parent plant is growing on a trellis, 3 feet wide by 4 feet high; in habit it is very thick, and sends out young shoots, some of which are now about 8 feet long, although it is in a cool conservatory. *E. Chadwick, Hanger Hill House, Ealing, W.*

Peas will also cause many of the Peas in the pods to crack owing to such excessive moisture and lack of ripening heat. As the seed crop will certainly be a moderate one, and the elimination of the split Peas later may reduce that crop, 30 per cent., would it not be well ere such hand-picking takes place, were the germinating properties of these split or cracked Peas tested, as it would be a misfortune, if so much good seed should be rejected simply because skins were split. In addition to the troubles stated new growth is being made by Peas also, so that the prospects of harvesting the crop readily, seems very remote. One market grower has found the present one a very good season for him, as his breadths have held out to the very last, indeed Runner Beans are finding late Peas still formidable competitors in the market. However the Beans are not so very abundant yet, but because of the cool temperature bloom is setting very profusely, and the crop should be a heavy one later. With respect to the question as to which is the earliest Pea, it seems probable, judging by the recent trial at Chiswick, that Mr. Laxton will settle that point by the introduction of his new early wrinkled variety *Gradus*; which, of some 3 feet in height, a good cropper, and of superior quality, seems to be quite as early as the old early rounds—whether it may prove hardy enough for field sowing in large breadths remains to be seen, but only very hardy Peas will pay to sow in the fields in February, and so far none seem better than a good stock of *Sangster's No. 1 A. D.*

**THE HEDGEHOG'S CRY** (p. 189).—Mr. F. W. Burbidge writes, "Pretty and harmless little animals," &c. I demur to the term harmless. This year a French partridge made its nest in a bed of outdoor *Hyacinths* in my garden; eighteen eggs were laid; the bird sat on them; one morning fourteen of the eggs were gone, the shells scattered about over a space of several yards. The next morning the other four eggs had been destroyed. I had some blackbird's eggs put into the nest, round which several rat-traps were placed. A large hedgehog was detained by them during the next night. In a field about 1½ mile off four partridges' nests were destroyed this year, and from the manner in which the egg-shells were scattered about it is nearly certain that hedgehogs were the culprits. As several of them had been killed by a fox terrier in the spring, it is clear that they were plentiful in the neighbourhood; I therefore demur to their being harmless animals. The author of *English Birds* says:—"A duck laid eggs under a lot of brushwood, some were taken, contents eaten, and shells found some yards off the nest. I set a steel trap. About 11 p.m. I heard a sharp cry—went to see; found a hedgehog in trap; killed it; set it up again—soon another hedgehog was caught. Again, on another occasion my man told me of a pheasant's nest being visited by something; went to see for myself. Three eggs only left out of many. I took these three eggs home, and made a small puncture in each, and inserted some strychnine in each, sealed up the holes with sealing-wax, placed them in nest, and waited for morning, when behold a large hedgehog lay dead close by the nest—two of the eggs had been eaten." *Robert Warner.*

—I once heard the cry of a hedgehog under the circumstances related below. I had been disturbed several nights by hearing a great commotion among the fowls, but on getting up could find no apparent cause for their alarm. However, on counting the young chicken (there were several broods in the yard), one or two were missing on each occasion, and others had been bitten by some creature on the head or neck. No trace of the missing ones could be found. I attributed the mischief to rats, and accordingly placed three traps, carefully concealed, in front of one of the hen-coops, blocking the chickens in so that they could not stray into the traps. I was awakened in the night by hearing some loud screams, apparently proceeding from some creature in an agony of terror and rage. It was different from the cry of any other animal I have ever heard, and I know not how to describe it, except as a shrill scream. On hastening to my traps, where the sound proceeded from, I found in it a fine hedgehog, caught by its leg, and screaming horribly. Need I say I soon put it out of its misery. I lost no more chickens after the death of the little animal, so am forced to the conclusion that the hedgehog was the robber. Can any of your readers inform me if there are other instances of hedgehogs attacking fowls? *W. H. W.*

**STOCKS FOR APPLES.**—Whenever the programme for the ensuing Apple and Pear Congress is arranged, it is to be hoped that some capable authority

will have undertaken to deal with the interesting topic of stocks for Apples. Prior to the introduction of the *Paradise*, *Doucin*, and similar French stocks our Apples had to be worked upon such stocks as locally placed at the nurseryman's disposal, and all were of the class now termed free. This term, not so many years since, would, if then applied to stocks, have needed some explanation, because then the dwarfing—and by some termed "cramping"—stocks were unknown. With the introduction of the French *Doucin* and *Paradise* came the need for defining terms, and the old Crab, or Apple stock, was termed free in contradistinction to the dwarfing stock, which certainly does contract to some considerable extent the ordinary growth of Apples. But of late we have heard more of the English or broad-leaved *Paradise*, a variety of stock, by-the-by, which seems to have an anomalous designation, as reputedly the chief bulk of the stocks seems to come from the Continent. However, we have over and over again been told by eminent growers that the French *Paradise* shows a tendency to cramp or contract the tree; it bears unduly, and that whilst later producing smaller fruits, the tree has its life contracted also: hence the greater value of the English *Paradise* stock, as that, whilst ensuring absolute fruitfulness, also restricted growth within due bounds, yet not such as to prevent robust growth and longevity. The present season has certainly been a remarkable one, and not least amongst its sins is the very wide contraction of our Apple crop; indeed, the average crop of the present season seems to be one of the lowest for several years. When, therefore, we find comparative sterility in Apples all around, and yet see in the Royal Horticultural Gardens at Chiswick on dwarf trees what can be regarded as a capital crop of fruits, it is difficult to avoid inquiry as to what special conditions affect these trees so favourably. The sorts are many, and representative of both dessert and kitchen kinds, curiously enough, they are all worked on the so-called French *Paradise*, as well as on the *Doucin* stocks. Pity it is that the Congress referred to was not just now, or at least early next month, to be held, as the Apple crops on these bush trees would serve admirably to the reader of a paper on Apple stocks the wherewith to point a moral and to adorn a tale. In how many gardens this year where the cultivation bestowed is greater than can be afforded at almost impoverished Chiswick, may there be seen numerous bush Apple trees worked on the English *Paradise*, and on which trees there is but a miserable crop indeed? The season past or present may be to blame, but it is very evident that what has affected injuriously the favoured stock has been good for the comparatively rejected stock; thus showing that, even in the matter of Apple stocks, every dog has his day, and certainly at Chiswick a capital day has this cramping French *Paradise* proved to be. It will be well also if, in dealing with the subject of stocks, some of the leading factor information for the enlightenment of sceptical gardeners be afforded as to the methods of propagation adopted, so as insure correctness and uniformity. A tradition seems to exist in some quarters that after all the broad-leaved *Paradise*, so-called, is a myth, and that the stocks so named are simply the pip-seedlings of dwarf-habited free-fruited Apples. It will be wise that the reader of a paper on this subject, should take his hearers into his confidence fully, and whilst striving to disabuse them of wrong notions, also make clear not only what various stocks really are, but how increased or propagated. Possibly he may go a little farther and deal with the question as to what kinds of Apples may prosper or generally thrive best upon the English or the French *Paradise*, or the *Doucin*; also as to the best stock for espaliers and cordons, although it is very evident that for dwarfing stocks the bush or semi-pyramid will ever be the favourite form of tree produced on them. There can be no doubt but the future of Apple cultivation in this country is largely bound up with the nature, not only of the stock upon which worked, but also with dwarf or bush trees, and the example referred to and now so noticeable at Chiswick evidences that fact in a practical degree. *A. D.*

**DAFFODILS AND MANURES.**—In the very interesting and instructive article by Mr. F. W. Burbidge in a recent issue there are some observations which appear to require an answer from myself. Mr. Burbidge seems to have become impressed with the idea that I regard the "mother, or breeder-roots," as the producers of the finest flowers, but the contrary is both my experience and belief. I believe in the "solid, well-

ripened globular bulbs" to produce the best blooms, such as the sample of *Tenby Daffodils* which I presented at the office of this paper a week or two back, and which were noticed by the Editor. The bulbs in question, though a very good sample, were not excessively large, but were noteworthy on account of their solidity and fine form; and I maintain that, if you get weight in medium-sized bulbs—say from 1½ to 1¾ inch diameter, and weighing from 1½ to 2 oz., regardless of how that weight and solidity are produced (i.e., with or without manures), you will be sure of fine flowers as the result. In "rich meadow loam" manure is quite unnecessary, for in such you have a most suitable soil for the free growth of the majority of *Daffodils*, and, indeed, many other things besides. Perhaps Mr. Burbidge will have a better idea of the hungry state of my soil when I say that three or four years ago even strong growing herbaceous perennials did little more than exist in it, and this notwithstanding that it had been trenched throughout, and from this fact I could only draw one conclusion, which was, that it needed well working and enriching. I quite endorse Mr. Burbidge respecting the growing of *Daffodils* on suitable soil without manure. But if any one, amateur or nurseryman alike, has to deal with a soil hungry and impoverished he must manure it to bring it into suitable condition, and by doing so it does not follow that he has done wrong, or that the bulbs have imbibed the greater part of the strength of the manure, since the soil itself is continually extracting from the same source. For various crops here, apart from bulbous plants, I have manured heavily, and at the end of a year not a vestige of manure could be seen. Much of my bulb land is in excellent condition now, and will grow bulbs well without adding fresh manure at present; but it cannot be expected to yield a good crop year by year unless stimulants be given in some form or other. In conclusion, I may say I should be very pleased to exchange samples of *Tenby Daffodils* with Mr. Burbidge, and see the difference arising from bulbs grown under totally different conditions, though I would prefer bulbs of as nearly equal size and weight as was possible. *E. Jenkins, Waterloo Villa, Hampton.*

## SOCIETIES.

### BRIGHTON AND SUSSEX.

SEPTEMBER 12 AND 13.—As in former years, the exhibition was held in the Royal Pavilion and on the eastern lawn adjoining. The competition in the plant classes was perceptibly less than usual, but nevertheless some noteworthy examples were staged, especially in the classes for flowering plants.

For six stove and greenhouse specimens in bloom, Messrs. Knight & Co., nurserymen, Hastings, staged an *Erica*, fresh and sweetly flowered set, *Lagerflora*, of large dimensions; *Erica Aitoniana* Turnbulli, very fine and densely covered with bloom; *E. cerinthoides* coronata, likewise in capital condition; and a good example of *Allamanda nobilis*; Mr. Meachen, gr. to Mrs. Armstrong, Woodlee, Brighton, being 2nd to the above with *Pimelea decussata* of huge size, and *Allamanda Hendersoni*, freely flowered, amongst others.

In a small class for four plants, Mr. Townshend, The Den, Dyke Road, was awarded 1st prize, *Ixora Williamsii* and *Azalea Narcissiflora*, being capital examples of medium size; Mr. Meache again taking 2nd place; and the premier position with *Allamanda nobilis* as a specimen plant.

An excellent set of six *Ericas* were shown by Messrs. Knight & Co., such as it is a treat to see nowadays when the best of the hard-wooded kinds are rarely met with; *E. ampullacea*, *Scottiana*, *E. retorta* major, *E. Marshalliana*, *E. Macnabiana*, *E. cerinthoides* coronata, and *E. tricolor* vera were the sorts here shown.

Groups of miscellaneous plants arranged for effect were attractive features at each end of the marquee, Mr. Turner, gr. to Major War, Wick Hall, Hove, being an easy 1st, with suitable subjects arranged in a light and informal manner; Mr. Meachen was 2nd, and Messrs. Stringer & Co., Hove, 3rd, both of whose groups showed the common error of overcrowding.

A group of Ferns arranged for effect, to which was worthily awarded the 1st prize in its class, was sent from the nurseries of Mr. W. Miles, West Brighton, and contained, among good things, a first-rate specimen of *Nephrolepis davallioides* furcans. Zonal *Pelargoniums*, smaller than usual but in capital condition, were shown by Messrs. Meachen and Town-

hend, to whom were awarded the 1st and 2nd prizes respectively for six and for four specimens.

Fine-foilage plants came from Mr. Curry, gr. to Colonel Pepper, Milford Hall, Salisbury, whose set of twelve contained a fine example of *Croton Countess*; and in a smaller class was a well-grown plant of *Chamaerops humilis*, from Mr. Meachen.

A few Orchids were shown, the best four coming from Mr. Moody, gr. to T. D. Goodman, Esq., Horsham, who had *Dendrobium formosum giganteum* in full vigour, bearing a terminal panicle of ten blooms; *Calanthe veratrifolia*, with several spikes, very fresh, and two others.

In the *Cut Flower* classes the prominent features were the Dahlias, the Roses, and the herbaceous flowers; these constituted almost a show in themselves. Messrs. Keynes & Co., Salisbury, were awarded 1sts for forty-eight and twenty-four show and fancies, as well as for Cactus or decorative varieties. Messrs. Cheal & Sons, Crawley, were 2nd for forty-eight varieties, and in a similar position with the Cactus or decorative kinds, but came strongly to the front with twenty-four singles and twelve pompons. The foregoing classes were of the highest merit. Mr. Vincent of Keymer, showed well in the smaller classes for amateurs.

Roses were shown in good form, and there was no lack of competitors. Messrs. Perkins & Son, Coventry, being 1st for forty-eight varieties, with bright flowers of good size and condition; Messrs. G. Paul & Son taking 2nd place; the order of the awards being reversed for twenty-four varieties from the same exhibitors. Mr. Campbell, of Bath; Mr. Slaughter, of Steyning; and Mr. Harris, of Horsham, all showed well in these and smaller classes.

Hardy herbaceous flowers were a most attractive feature, being shown in large numbers and in the best possible condition. Messrs. G. Paul & Son securing the 1st prize with thirty-six vars. which it would have been hard to beat. Large collections were also shown by Messrs. Cheal & Son, and Messrs. Woolford.

Gladioli came from Messrs. Kelway & Son, Langport, and twenty-four vars. of stove and greenhouse cut flowers from Messrs. Knight, to both of whom 1st prizes were deservedly awarded.

Messrs. Perkins were strong in bouquets and a wreath, securing a 1st in each instance.

*Fruit*.—For twelve dishes, Mr. Ward, Longford Castle Gardens, Salisbury, was 1st, with a thoroughly representative and meritorious collection; his best dishes were Gros Maroc and Muscat of Alexandria Grapes, Blexheim Orange and Hero of Lockinge Melons, both grand fruits, the former weighing 7 lb.; and a good dish of Castle Kennedy Figs. Mr. Goldsmith, Kelsey Manor Gardens, Beckenham, was a good 2nd, being strong in Grapes, and he had an excellent dish of Clapp's Favourite Pears.

Mr. Richards, Somerley Gardens, Ringwood, and Mr. Ward each scored a 1st in two classes for Pine-apples with fine fruits.

Three fine bunches of Madresfield Court Grapes each secured the 1st prize. Mr. Ward; and three of Black Hamburgh, from Mr. Godlee, Burgess Hill, were deservedly 1st in their class.

In two classes for white Grapes, Muscat of Alexandria were shown in fine condition by Mr. Goldsmith and Mr. Baker, Ottershaw Park, Chertsey, each securing a 1st.

The best Peaches, including a very fine dish of Sea Eagle, came from Mr. Lucas, Warnham Court Gardens, Horsham, who was also 1st for a single dish of Nectarines, with Pine-apple in good condition; whilst for a couple of dishes Mr. Goldsmith was to the front. The last-named was 1st for dessert Pears, with a bright dish of Clapp's Favourite. In another class for Pears, Williams' Bon Chrétien were the best, coming from Mr. Holman, gr. to Viscount Gage, Firlie Park.

Plums were best seen in Jefferson, from Mr. Lucas and Mr. Holman, each of whom took 1st in two classes; with Green Gages Mr. Ward won with a dish of extra size and quality.

First prizes for Figs were awarded to Mr. Gatehouse, Dover, and Mr. Butler, Lancing, each exhibitor putting up fine fruits of Brown Turkey.

Morello Cherries were a strong class, the best dish coming from Mr. Duncan.

Two 1st prizes for culinary Apples were awarded to Mr. Gilmour, Seaxox Heath, Hawkhurst, in two classes for extra fine fruits of Pott's Seedling and the Queen.

First prizes for vegetables were awarded to Mr. Goldsmith for six kinds; and to Mr. Goring, of Worth, Sussex, for a collection not limited to any number; the latter exhibitor might take a hint from

the former, and show, on a future occasion, produce of smaller selection with advantage.

Miscellaneous exhibits were a most attractive feature, especially so was the large group of tastefully arranged decorative plants, with conspicuous examples of brightly coloured *Crotons* and herbaceous outflows of the choicest kinds, with fine selections also taken from the stove and greenhouse, these with cut Roses and Gladioli came from Messrs. Wm. Balchin & Sons, and did them great credit. Mr. George Miles staged another excellent group, among which was the early-flowering *Chrysanthemum* Mrs. Durrell, in excellent condition. A large collection of herbaceous cut flowers, consisting of nearly one hundred varieties, from Mr. Clark, of Dover, were a most instructive feature; so also were the fifty-five dishes of Apples, Pears, and Plums, from Messrs. Cheal & Son. Three Vines in pots, with numbers of bunches on each, were shown in most creditable condition by Mr. Jenner, Toronto Terrace, Brighton, an amateur cultivator.

## DAHIA AND HOLLYHOCK SHOW AT NEWPORT, ISLE OF WIGHT.

SEPTEMBER 12.—A praiseworthy attempt is being made in the island to revive the growing of the Hollyhock—a flower once seen in almost every garden, but one which has of late years almost died out owing to the disease which attacks it. The recently formed Isle of Wight Dahlia and Hollyhock Society, which has been established to give impetus to the cultivation of the flower, held its first show in the Borough Hall, Newport, on the above date, and was well patronised by the public. The show itself was a creditable one generally, the hall presenting a pretty appearance. Among other exhibits was a collection of pot plants, tastefully arranged in the rear of the exhibits. Mr. Cave, nurseryman, and Mr. T. W. Gould, both of Newport, sent two stands each of Dahlias, not for competition. Amongst other flowers shown, but not for competition, were French Marigolds, Zinnias, and Asters, by Mr. Blake, Arretton; and a lovely box of Roses and two Gladioli by Mr. G. Williams, of Gatcombe, whose Roses especially were greatly admired. There was not much competition in some classes, and in these only one prize was awarded; in others, on the contrary, the competition was much better, especially in those for Asters. Hollyhocks, which should have been the chief of the exhibits, were not shown in large numbers, but Dahlias more largely by nurserymen, gardeners, amateurs, and cottagers; and as a new start in the island the show was a matter for congratulation, much of its success being due to the exertions of Dr. J. Groves, M.D., the Honorary Secretary.

## GRANTHAM HORTICULTURAL.

This Society held its seventeenth annual show on Thursday, September 13, in the Exchange Hall. Considering the beautiful and summer-like weather which prevailed on that day, it appeared somewhat out of place to see a goodly array of exhibits within massive stone walls. This step was taken with a good intention, on account of the unsettled state of the weather. The entries were many, and the exhibits on the whole excellent, but the attendance was thin. The centre of the hall was set apart for groups of miscellaneous plants, and other exhibits occupied the space at the sides. Vegetables were good, the Potatoes particularly, the prizes for which were keenly contested. Fruit was also abundantly shown in collections, also as single dishes. Single specimens of specimen plants were not prominent as a feature, although the various groups contained some fairly grown ones. Cut flowers were good.

*Group of Plants (open class).*—Irrespective of several "not for competition" groups, these, as mentioned above, were fairly good, the 1st prize being awarded to J. R. Boyall, Esq., Castle Gate House, Grantham, for an artistically-arranged group of miscellaneous flowering and foliage plants. Closely following this was a smaller, though none the less attractive, group, shown by Mr. G. Martin, Spittlegate Nursery, to which the 2nd prize was awarded; the 3rd award was carried off by Mr. S. J. T. Barrett, Redcliffe. Various other plants in different classes were shown, the most noteworthy being six *Caladiums*, distinct, shown by Messrs. Barrett, Redcliffe; six *Coleus*, H. Escriit, Grantham; six fine tuberous *Begonias*, G. H. Sage, Buckminster; while the best table plants were shown by G. H. Sage and G. Martin.

*Cut Flowers.*—These were exceptionally good,

especially a collection of double and single Dahlias shown by Messrs. W. & J. Brown, Stamford Nurseries, among the doubles. The same firm also gained a similar honour for a smaller collection of Dahlias. For a splendid collection of hardy and half-hardy cut flowers, G. H. Sage, Buckminster, was deservedly awarded the 1st prize, the 2nd being taken by Messrs. Brown.

Roses also for the time of year were excellent, in fact a "not for competition" collection, shown by Messrs. Burch, Peterborough, gained the admiration of all. Among others were some splendid blooms of W. A. Richardson, The Bride, Grace Darling, Niphetos, Sunset, and Madame de Watteville. The same firm likewise exhibited a box of twelve distinct Roses for which they were awarded the 1st prize, the 2nd being awarded to G. H. Sage.

For a vase or epergne of fruit or flowers W. & J. Brown came 1st, closely followed by J. Patman.

*Fruit.*—In single dishes, Mr. J. Crawford, Coddington Hall, was awarded 1st prize for a creditable collection of Grapes, Melons, Pine-apple, Peaches and Nectarines. This was followed by similar collections shown by Mr. T. Hare, Wellington, and Mr. J. H. Escriit, Grantham, for which the awards were given in the order named. For three bunches of black Grapes the prizes were awarded, in the order of their names, to J. R. Boyall and H. Escriit respectively. Three white ditto, J. Crawford and T. Hare.

Six Nectarines.—J. Crawford.  
Six Peaches.—G. H. Sage, 1st; J. Patman, 2nd.  
Melons.—1st, Mr. J. Patman.

Apples were good, the principal exhibits being six varieties (dessert), 1st, Mr. G. Martin; six varieties (kitchen), 1st, Mr. H. Escriit.

Pears were also fairly good, the best dishes being staged by G. Martin.

Plums, however, brought forth the keenest competition among the fruit, some splendid dishes being staged by Messrs. G. H. Sage, J. Crawford, and J. Hare, for which prizes were awarded respectively.

*Vegetables.*—For the best collection of Potatoes, 1st, Mr. Johnson, with some splendid tubers, prominent among which were International Kidney, Sutton's Abundance, and Future Fame. The 2nd collection, exhibited by Mr. J. Woodward, was also noteworthy, and comprised some fine specimens of Beauty of Hebron, White Elephant, &c. Several good collections of vegetables were also staged, the best being Mr. W. Hubbard's. Tomatoes and Peas also, considering the season, were good, some fine dishes of the latter being shown by Messrs. Johnson, Sage, and Woodward.

A point worth recording is the distribution by the Society, free of cost, of fruit trees and seeds, which takes place at stated intervals during the year.

## THE CRYPTOGRAMIC SOCIETY OF SCOTLAND.

THIS Society held its fourteenth annual conference at Inverary on the 12th and 13th inst. under the presidency of the Duke of Argyll. The meeting was a most successful and enjoyable one; and the exquisite scenery of Inverary was seen to the best advantage from perfection of weather. The members had the pleasure of welcoming Mr. William Phillips, Shrewsbury, and Dr. Carlyle, Carlisle. A spacious pavilion near the Castle, originally erected for the home-coming of the Marquis and (Princess Louise) Marchioness of Lorne, was kindly granted for the meetings of the Society. A large collection of fungi, gathered in the neighbourhood by the Duke's instructions, was laid out for examination; and a fine collection of lichens, also gathered in the neighbourhood by Dr. Macmillan of Greenock, Vice-President, was exhibited. In addition, contributions were received from Colonel Harrington Stuart of Torrance, Mr. Heron, Mount Stuart, Bute; Mr. Thorburn, Castle Semple, and Mr. J. Proctor, Glenfinnart, Ardgleny. The cryptogamic flora of Inverary is rich, and during the slight excursions which time permitted, many species of interest, especially among lichens and fungi, were gathered. It may be mentioned that on a single Ash tree, within 8 feet from the ground, Mr. Phillips gathered fifteen distinct species of lichen. The forenoon of the 12th was spent in examining the collections in the pavilion. The species were named, and specimens of edible and poisonous fungi were set apart. As the results will be published elsewhere it is unnecessary to specify the varieties which were discovered. After entertaining the members at luncheon, the Duke conducted them to his museum, which contains many fine geological and archaeo-

logical specimens. In the evening, after the transaction of the business of the Society, the noble President gave an interesting and suggestive address on the "Cryptogamic Flora" to the members and a large assemblage of the public, after which various papers of interest were submitted. After an excursion on the 13th the annual dinner concluded the conference.

Many of the trees in the Castle park attracted special attention. The following measurements of trunks will serve to indicate their age and beauty:—Scotch Fir, at 2 feet from the ground, 15 feet, and at 4 feet, 13 feet 8 inches in circumference; Silver Fir, at 2½ feet from the ground, 15 feet in circumference; Spanish Chestnut, at 3 feet from the ground, 20 feet 6 inches, and at 5 feet, 19 feet 8 inches in circumference, the height of the trunk to the first branches being 15 feet. In the garden, which was kindly shown by Mr. George Taylor, there is a specimen of *Arbor-vita* which covers an area of 225 feet in circumference. Its age is unknown, but it must have been among the first specimens introduced into Britain.

The warmest thanks of the members are due to the Duke of Argyll for the great kindness with which he received the Society. The next annual conference will be held at Crieff, Perthshire. *J. Stevenson, Glamis, Forfarshire.*

## LAW NOTES.

### AN INTERESTING SEED DISPUTE.

Is the City of London Court on Friday, September 14 last, before Mr. E. T. E. Besley, Deputy Judge, the case of Witherton v. Allen was heard, which raised a question of importance to gardeners, &c.

The action was brought by the plaintiff, Mr. Isaac Witherton, of Old Corn Exchange, E.C., to recover the sum of £6 5s. 6d., the price of seed supplied to the defendant, Mr. Robert Allen, of Ruxley, Footscray, Kent. Mr. Passmore appeared for the plaintiff, and Mr. Vennell for the defendant. A counterclaim for £50 for damage was set up. The defendant did not dispute the fact that the seed was delivered, and he practically admitted the claim subject to the counterclaim. The seed was supplied in August and September, 1884, and in February, 1885, six months afterwards the defendant wrote and complained of the seed, and said he was dissatisfied with the crop it had yielded. The counterclaim now raised was for the damage the defendant had sustained in consequence. The Deputy Judge interposed by remarking that the counterclaim could not be substantiated. He never heard of a person selling seed and guaranteeing the quantity which should be yielded. Mr. Vennell said the plaintiff had not given a specific guarantee, but he contended that there was an implied warranty that the seed would produce an ordinary and fair crop if properly used and properly sown. The crop was so disproportionate and out of all character that the only conclusion the defendant could come to was that the seed was bad.

The Deputy Judge said it was impossible to go into it. There were numerous reasons for it being bad. He declined to go into the atmospheric influences of 1884. Unless the defendant examined the seed before it was put into the ground and found it was dead seed, the counterclaim could not be allowed. He must find against the defendant. Judgment was given for the plaintiff on the claim; the counterclaim was dismissed, and the plaintiff allowed his costs.

## Obituary

MR. COURT.—We regret to have to record the death of Mr. Court, the talented propagator at Messrs. J. Veitch & Sons' Chelsea nursery, which took place almost suddenly on Monday afternoon, September 17. Mr. Court was only forty-five years of age, and had been ailing for some time past. He was at one time in the employment of Messrs. Lacombe & Pince, Exeter, and left them to enter the Exeter branch of the Veitchian establishment about twenty-five years ago. He was an excellent propagator and plantsman, and a genial clever man of business. His name will be associated with the hybridisation of *Nepenthes*, one of which is named after him.

## THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## THE PAST WEEK.

The following summary record of the weather for the week ending Sept. 17, is furnished from the Meteorological Office:—

"The weather has been finer and in a more settled condition generally than that experienced for many weeks past.

"The temperature has not differed materially from the mean, being 1° above it in the north and east of Scotland and the same amount below it in most other parts of the kingdom. During the daytime the thermometer was generally high, readings of 70° and above being at times recorded; the nights, however, were in most instances cold, and the lowest of the minima ranged from 34° in 'Scotland, E.' to 39° in 'England, N.E.' and 'Scotland, W.,' and to 44° in the 'Channel Islands.'

"The rainfall has been less than the mean in all districts; over England the fall has been scarcely appreciable.

"Bright sunshine shows a decided increase. The percentage of the possible amount of duration, which ranged from 26 in 'Scotland, N.' to 53 in England, S., 55 in England, S.W., and 73 in the 'Channel Islands,' has not been so high over the kingdom generally since the week ending May 28."

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING SEPT. 29. (AVERAGE OF FORTY-FOUR YEARS.)

Sept. 23 ...	56° 3	Sept. 27 ...	55° 6

" 25 ...	55° 9	" 29 ...	55° 2
" 26 ...	55° 7	Mean for the week	55° 7

## ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

DYING-OFF BRANCHES OF BEECH.—Can any of your readers offer any explanation of the cause of the sudden death of some young branches of a Beech tree growing on the lawn? They have made good growth this season until now, when the leaves shrivel and the bark dies. *X.* [See p. 335.]

## NOTICES TO CORRESPONDENTS.

BOOKS: *W. A. Smith.* The best book on the subject is *Domestic Floriculture* by F. W. Burbridge (Blackwood & Sons). We do not know the price.

CAMELLIA BORDER: *G. R.* The soil sent was full of the spawn of some species of fungus—probably spread from decaying roots or pieces of wood in the soil. Clear out the old soil now, and replant the trees in fresh materials—failing that being done the plants will perish.

CENTAUREA AUREA: *C. W. D.* The Port Juvenal plant seems on the authority of specimens from that locality, as well as others from the Horticultural Society's Gardens at Chiswick, in the Kew herbarium, to be the *C. fuscata* of Desfontaines, which rejoices in the following aliases:—*C. nicotensis*, *C. sicula*, *C. marginata*, *C. aurea* of Desfontaines, *Cat. Hort. Par.*, ed. 3, 1829 (teste *Jap. in herb.*, Kew). *C. aurea* of Aiton, *Hort. Kew*, and figured in the *Bot. Mag.*, t. 421, is quite a different plant, a representative of which is in the Kew herbarium from Roumelia, but to which no name is attached.

CHRYSANTHEMUM: *X. Y. Z.* The stems are infested by a kind of sclerotium, or fungus growth, of which several kinds infest the stems, bulbs, and tubers of plants. No remedy can be suggested except burning all infested plants so as to stop its spreading. Attempts will be made to ascertain its further history by cultivation, as nothing definite can be determined in its present sterile form. *M. C. C.*

CORRECTIONS.—In our report of the plants awarded Certificates at the last meeting of the National Chrysanthemum Society (p. 307), for "Mr. Bennett" read Mrs. Hawkins.—In report of Fruit Growers' Conference at the Crystal Palace (p. 292), Mr. A. Bath's address should have been Sevenoaks, not Foot's Cray.

DARLINS: *H. C. & S.* The blooms of the decorative varieties which you forward are in the majority of cases very pleasingly coloured. Prince of Wales is large and brightly red; and of a pleasing pale tint is the Yellow Juvenal. W. F. Aberly is a pretty single flower, the rich crimson margins of the white petals making a very striking combination. Prince Albert Victor and Annie Harvey are fine deepreds, and the crimson-lilac tips to Charming Bride render it distinct. Others are pretty in their way, probably, but we prefer the foregoing.

DEFORMED PEARS: *J. H.* The injury is caused by *Helminthosporium pyrorum*. There is no known remedy. You might burn foliage and affected fruit, but in the case of these microfungi it is doubtful if such measures cause any lessening of the evil. You might try diluted Gishurst soap as a summer wash, taking care to wash it off in half an hour with clean water.

DIANTHUS LEAVES DISEASED: *C. W. D.* The plants are affected with some obscure species of *Proto-mycetes*, not well matured—one of the lowest forms. *C. M. C.*

**GRAPES: Novice.** Your berries were smashed almost beyond recognition; send others, packed in a tin box.

**INDIARUBBER AND CASTOR-OIL: C. F. W.** These plants do not belong to the same genus, although both are natives of the Tropics. "Indiarubber" is a gum obtained from diverse species of plants, and the Indiarubber plant of English gardens is *Ficus elastica*. It may be grown in a cool-house, where the temperature does not sink below 45°, but does best in a warmer one; in the former very infrequent waterings will be required by the plant during the period November–February, as it is then at rest. Growth should be assisted in the spring by putting the plant in warm pit or stove, and as soon as there are signs of renewed growth it should be either repotted in a mixture of three parts loam and one of peat, with a little sand added, and the pot should be rather over than under-sized; or be top-dressed. Keep the plant in warmth till July, when it may be hardened off by degrees if it is to stand out-doors, or it may then be put in the greenhouse. When cool-grown, repotting may be done in April or May. A moist atmosphere and plenty of water suit the plant during active growth. The second-named plants are usually treated as annuals, and may be raised from seeds sown in pots in a hotbed or stove at any time in early spring. The plants should be potted off singly, before the roots get entangled, and kept near the glass in a warm-house till the beginning of May or later, when they may be hardened off by degrees and planted out-doors in rich well-drained beds in June and July.

**INSECTS: A. S.** The insect sent, found in your Cattleya-house, is a very young female grasshopper belonging to the family Gryllidae; evidently imported, probably in the egg state. It is certainly injurious to Orchids, and should be trapped.—*A. F. B.* We have not previously heard of the real wireworms (as those you send are) having nearly destroyed an entire houseful of Vines, on the roots of which they were found—we suppose by gnawing off all the fine rootlets. They are, however, never omnivorous. *I. O. W.*

**NEW PALM-HOUSE AND CHATSWORTH CONSERVATORY: A. E. H.** The first-named is 382 feet, total length, with a width in the centre of 100 feet, and a height of 66 feet; the wings are about twice the length of the central part, and are 50 feet wide and 30 feet high. Chatsworth conservatory is a simple parallelogram of 300 feet by 145 feet.

**LAYING-OUT A GARDEN: W. H.** *How to Lay Out a Garden.* By E. Kemp. Bradbury, Agnew & Co., 10, Bouverie Street, Fleet Street, E.C.

**LIME FROM TANYARDS: J. C.** We have no personal experience of the employment of the lime from a tanyard for Vine borders; but we should think it would well answer for the purpose.

**LICORICE (GLYCERYHIZA GLABRA): Myosotis.** This plant requires deep sandy soil, which should be deeply trenched and well manured. The "sets" are made from pieces of the roots having two eyes at least. As the plant is large and coarse growing it would require about the space between the rows as that given to Horse-radish in gardens. It grows well enough in Yorkshire, and we think it would do as well in Northumberland.

**NAMES OF FRUIT: J. Earl.** Peach Royal George.—*W. Troughton.* 1, Apple Beauty of Kent; 2, Pear Summer Bergamot?—*J. Pince.* 1, Emperor Alexander; 2, Kerry Pippin; 3, Dumelow's Seedling.

**NAMES OF PLANTS: G. Boore.** Bifrenaria vitellina.—*J. L. Seaham.* 1, *Coronilla emerus*; 2, *Buddleia globosa*; 3, not found; 4, *Lycasteria formosa*; 5, a *Rubus*—no flower.—*T. S. Hawkstone.* 1, Apparently *Thuja orientalis*; 2, *Cupressus Lawsoni*; 3, *Thuja plicata*; 4, A variety of *Thuja orientalis*—perhaps the form known as *Sieboldii*. Why send such scraps? *E. O. R.* 1, *Nephrodium contortum*; 2, *Pteris longifolia*; 3, *Oncophyllum sensibile*; 4, *Pteris cretica variegata alba*; 5, *Adiantum cuneatum*; 6, *Asplenium borbonicum*.—*F. Carr.* *Spirea Douglasii*.—*Watney.* *Buckhold.* 1, *Chimonanthus floridus*; 2, *Hypericum Hookerianum*; 3, *Spirea japonica*.—*Hyem. Henderson & Sons.* 1, *Calamintha officinalis*; 2, *Stachys*, specimens insufficient; 3, *Aconitum anthora*; 4, and 7, *Veronica spicata*, two forms; 5, *Polygonum amplexicaule*; 6, *Lysimachia ciliata*.—*G. Bunyard.* *Athyrium Filix-femina* var. *molle*.—*J. J. W.* 1, *Aster punctatus*; 2, *Medicago denticulata*; 3, *Campanula latifolia*.—*W. G. B.* and 1

2, *Centaurea saloniatica*.—*J. C.* *Stachys lanata*.—*G. M., Olivet.* 1, *Cynocleone chlorochilum*; 3, *Dendrobium formosum giganteum*; 5, *Oncidium Jonesianum*; No. 2 was mislaid, please send again; No. 4 was not sent at all.—*W., Effe.* *Alstromeria Pelegrina*. The Carnations show a good range of colour, and would doubtless be good border plants. We do not distinguish anything of special merit.

**PEA: W. C.** The Pea sent, stated to have been the result of crossing Culverwell's Prolific Marrow with Ne Plus Ultra, differs in form of pod considerably from the latter variety, and is, we think—at least in the raw state—of as good flavour, whilst the full-grown Peas are rather larger, as sweet and green, and number on an average eight in a pod. The shell is heavy, being nearly two-thirds of the total weight of the pod, but that may be an advantage from the gardeners' point of view, thick fleshy pods hindering the ripening of the seeds. We do not know what may have caused the delay at Chiswick.

**THE OAKS, EPSOM.—IF "F. C. H. M."** will send his proper name and address—not necessarily for publication, but as a pledge of good faith—we may put in his note on Cyclamen growing.

**VINES IN BAD SOIL: W. Baker.** Lift them without unnecessary delay, digging out every healthy root, and envelope the mass of roots in damp moss and bast mats until the border is in readiness to receive them. Wheel out the worst of the old soil, put the drainage in good order, and make a new border, not more than 2 feet deep, of turfy loam, putting with this about  $\frac{1}{2}$  cwt. of Thomson's Vine Manure to the ton of soil. Make the border only as wide as the longest roots, as you can then add to it as these reach the limit of its width. This will apply to both outside and inside borders. If the work is expeditiously done, before the foliage falls off, you may take a short crop from the Vines next year. Keep the house rather close for a time after lifting, and thoroughly water the Vines, so that the leaves recover from their flagged condition, and fall naturally, otherwise the results will not be so good, and full recovery could not be expected before the lapse of another season.

**COMMUNICATIONS RECEIVED.**—Canon E. (many thanks).—*E. C. G.* (many thanks).—*Will follow.*—*E. J. W.*—*E. J. V.*—*J. H.*—*H. C. J.*—*L. G. S.*—*P. B.*—*G. W. N.*—*J. ## SEEDS.

LONDON: Sept. 19.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report a greatly-increased speculative activity in Clover and other seeds; and considerable quantities of red, white, Alsike, and Trefoil have this week changed hands at enhanced currencies. The new crops promise to be very bad. Perennial and Italian Ryegrasses continue firm. Trifolium is getting scarce, and realises full prices. Winter Tares keep in moderate supply, and values are unchanged. For blue Peas there is an improving enquiry. Bird seeds find buyers on former terms.

## FRUIT AND VEGETABLES.

SPITALFIELDS: Sept. 19.—Good supplies of all kinds of fruit, farm, and market garden produce. Trade somewhat heavy. Smaller supplies of Potatoes. Prices higher. Quotations:—Fruit: Damsons, 3s. to 3s. 6d. per half-sieve; English Green Gages, 6s. 6d. to 8s. per bushel; English Plums, 2s. 6d. to 3s. 6d. per half-sieve; foreign do., 1s. 3d. to 2s. per basket; Pears, 3s. to 5s. per bushel; Apples, 3s. 6d. to 5s. 6d. do.; do., 1s. 6d. to 2s. 9d. per half-bushel; English Tomatoes, 4s. to 8s. per peck; foreign do., 3s. to 3s. 6d. per box of about 18 lb. Vegetables: Cabbages, 1s. 6d. to 2s. 6d. per tally; Cauliflowers, 1s. to 2s. per dozen; Vegetable Marrows, 2s. to 3s. per tally; Scarlet Runners, 2s. 6d. per sieve; French Beans, 2s. to 3s. per bushel; Dutch Onions, 3s. 6d. to 4s. per bag; Belgian Onions, 2s. 6d. to 3s. 4d.; English do., 1s. 6d. to 2s. per dozen bunches; Parsley, 1s. 6d. to 2s. do.; Turnips, 2s. to 2s. 6d. do.; Carrots, 1s. 6d. to 2s. do.; Beetroots, 1s. 6d. to 2s. do.; Mint, 1s. 6d. to 2s. do.; pickling onions, 3s. 6d. to 4s. 6d. per bag; frame Cucumbers, 2s. to 3s. per dozen; common do., 4d. to 6d. do.; Endive, 1s. 6d. do.; Cos Lettuce, 8d. per score; Carrots, 2s. to 3s. 6d. per ton.

STRATFORD: Sept. 18. Both trade and supply have been good during the past week. Prices:—Cabbages, 2s. to 3s. per tally; Cauliflowers, 2s. per dozen; Turnips, 2s. to 2s. 6d. per dozen bunches; Carrots, household, 30s. to 40s. per ton; Mangels, 19s. to 23s. do.; Swedes, 24s. to 26s. do.; Onions, Dutch, 3s. 9d. to 4s. 3d. per bag; Watercress, 6d. per dozen; Pears, Dutch, 2s. 6d. per bushel; Apples, 7s. to 8s. per barrel; do., English, 5s. to 10s. per bushel; Plums, 2s. 6d. to 3s. per half-sieve; Tomatoes, 5d. to 6d. per lb.; Beetroot, 3s. per dozen; Carrots, 2s. do.; Cucumbers, 4d. do.

## POTATOS.

BOROUGH AND SPITALFIELDS: Sept. 18.—Blight is still prevalent, but a portion of the supplies are coming better assorted, and for the best of such there is a steadier trade with firmer prices, whilst inferior parcels still sell badly:—Regents, 30s. to 80s.; Hebrons, 60s. to 80s.; Early Rosers, 50s. to 70s.; Magnum Bonums, 50s. to 90s.; Myatts, 50s. to 60s. per ton.

**TO SEEDSMEN, &c.**—A Gardener wishes to place his daughter, age 16, where she could learn the Making of Crosses, &c.—**E. FORNACHON**, Great Abington, Cambridge.

**HANDY-MAN**.—Useful for Building and Repairing Greenhouses, &c., in Carpentering, Painting, Glazing, Hot-water Pipes, &c., Rustic or Rockery done.—**MILLINGTON**, 32, Kilburn Park Road, Maida Vale, W.

**HOLLOWAY'S PILLS and OINTMENT.**  
Though it is impossible in this climate of changing temperature, to prevent ill health altogether, yet its form and frequency may be much mitigated by the early adoption of remedial measures. When hoarseness, cough, thick breathing, and the attending slight fever indicate irritation of the throat or chest, Holloway's Ointment should be rubbed upon these parts without delay, and his Pills taken in appropriate doses, to promote its curative effect. Catarrhs of the bladder, &c. are remedied. Printed directions envelope every package of Holloway's medicaments, which are suited to all ages and conditions, and to every ordinary disease to which humanity is liable.

## SPHINCTER GRIP GARDEN HOSE

The Sphincter Grip Spring Steel Galvanised Armoured Hose is the most valuable improvement in Hose since 1840. Its lasting qualities are ten times greater than any Hose not armoured. Its complete success has caused some parties to infringe the Patents owned and controlled solely by us; and we therefore notify all such that the making, vending, or use of any armoured wire-wound Hose not of our manufacture is an infringement of one or more of our several Patents, any violation of which will be promptly prosecuted. Brass plates set between the Hose and wire denote our Manufacture and the Patents.

For Price Lists and particulars of  
The Original and Only Genuine Sphincter Grip  
Armoured Hose,  
APPLY TO THE

S.C.A. HOSE CO. (Ltd.),

## MOTE PARK.

THE Mote, as this place was formerly called, is a very ancient site. There are two notes in Kent, and many others elsewhere, and although some of these are mis-spelt and derive their names from the moat that surrounded them, others, like the one I am about to describe near Maidstone, trace their origin to the Anglo-Saxon mote, an assembly or court of justice, which used to be held in the vicinity. The gardens of the Dowager Lady Howard de Walden, the present occupier of Mote Park, are so extensive and interesting that they will not leave me space for much historical description. It must suffice to say that in the time of Richard II. the Mote passed from the family of Leyborne to that of Woodville, one of whom was created by Henry VI. Lord Rivers, Grafton and De La Mote. There are few persons, perhaps, with such a minute knowledge of history as to remember that Elizabeth Woodville, the daughter of this nobleman, became the wife of Edward IV., and afterwards his widow and mother of the young princes who were murdered by their uncle, the Duke of Gloucester, in the Tower. But the play of *Richard III.* will recall to mind the sad history of the Woodvilles. Many persons doubtless will remember that Lord Rivers was executed at Pomfret by that general murderer, King Richard, and that his ghost was one of the dozen that Richard's "coward conscience" called up on the night before the battle of Bosworth.

After several changes of ownership the Mote passed in 1690 into the possession of the Marshams, whose representative, Sir Robert Marsham, was created Lord Romney in 1716. The third Lord built the present square, capacious, white house, whose east front is by far the best, because it is most covered up by creepers. The third Lord gave a great dinner to 3000 guests, including that excellent farmer, George III., and a number of the Kentish yeomanry. The festival was held near the site of the old house, on a spot where a pavilion has since been erected to commemorate it. The present owner of Mote Park is the fourth Earl of Romney. It is a place of

great beauty and delight, perfectly retired though bounded on one side by the high road on its entrance into Maidstone. The Len runs for a distance of 2 miles through the park, expanding into a lake before the house, and entering the Medway at Maidstone immediately after quitting the domain. A principal lodge and entrance gate stands almost in the town, and from that spot a walk or drive, whichever it may be—only it ought to be slow for the sake of prolonging the pleasure—passes up the valley of the Len, through a charming park of 600 acres, 1 mile to the house and 1 mile further on to the spot where the park commences. It is a path of changing levels free from monotony, and the timber, planted probably about the time when the house was built, is better than if it were ancient, since the trees, growing as they do, in rich, deep soil in the "rags," of Kent, are young and vigorous, yet they are already great and sometimes grand in size. There is a great variety of timber, and it grows tall, as the Apples in the orchards do in Kent. It seems that branches run up in proportion as roots run down: the Oaks and Elms accordingly are taller than on poorer soils.

In passing up the carriage-drive I observed the Turkey Oak, Acacias, Sweet and Horse Chestnuts, Tulip trees, and Planes, all large handsome trees, with the White Thorn and Laburnum sometimes growing singly, sometimes intertwined. I passed an Elder of unusual size, several Catalpas coming into flower, and *Ailanthus glandulosa*, which flowered freely last year. The shrubberies around the house afford an interesting lesson in arboriculture and botany, from the great variety of plants that have been introduced.

The house, gardens, and shrubbery cover about 40 acres of ground, the vegetable garden occupying 7 acres, and yet it does not produce more than is required for the different establishments of the family, though it would be difficult to conceive a garden more productive. The garden proper,\* exclusive of the park, employs twenty-five gardeners under the care of Mr. Charles Davies. The extensive ranges of houses, which existed three years ago, were described in the *Gardeners' Chronicle*, October 10, 1885; but since that date they have become much more extensive, so that there is much that is new to notice. The walk round the garden with Mr. Davies must be a rapid one. Quitting the kitchen we crossed a lawn, and then entered an orangery ventilated thoroughly and very cleverly by a contrivance invented by Lady Howard de Walden herself. We then passed along a broad walk a quarter of a mile in length, and passing straight to the door of the house on the east side. One would like to saunter here very slowly to observe not only the flowers and shrubs which fill the borders of the walk, but the just proportions both of the pathway and its borders. The former is 15 feet wide, each border is 20 feet wide.

At the back is a row of Wellingtonias, looking very well at present, but they do not much like the Kentish rag, and are apt to show their objections as they grow older. In front of these is a row of *Rhododendrons*, *Azaleas*, and *Kalmias*, and then, next the gravel, beds of flowers edged with the dwarf *Euonymus* (*radicans variegata*), *Heaths*, *Retinospora*, and other suitable evergreens. The long borders are filled with herbaceous and other plants, some of which are changed during the summer, so as to produce a display of flowers always at the best, and often varying. There are *Penstemons*, and *Pelargoniums*, and many more favourite plants, with the *Gladiolus* and *Lilium*

*auratum* in pots for removal. Bulbs for spring flowering are planted in their season.

A terraced garden on the south side of the house is planted with banks of *Rhododendrons* and beds of *Roses*, *Asters*, *Lilium auratum*, herbaceous *Phloxes* and *Petunias*, the terraces being divided by lines of *Hedgehog Holly*, *Golden Yew*, and *Golden Retinospora*, 6 or 8 feet high, and very rich in colour, which is characteristic of this spot. Leaving the terrace we entered a walk, which passes for the length of a mile through that part of the 40 acres, which is devoted to shrubbery. It is a delightfully cool walk, shaded by good old sorts of trees and shrubs, such as *Yews*, *Hollies*, *Box*, *Laburnum*, and many less common, though not perhaps less beautiful. Five acres of orchard, planted by Mr. Davies on the Kentish plan, are enclosed by the shrubbery, and we passed this orchard in our way. We passed, too, several clumps of stately *Elms*, with seats beneath, very tempting on a hot day. There are various *Conifers* dotted about, but at a certain age they die at the top. Apple trees grow as tall as you please and continue to bear abundantly when as big as timber trees. It is said that their roots run down deep into the fissures of the ragstone, which, on the contrary, *Conifers* cannot tolerate.

In the course of our stroll we passed a specimen of that handsome shrubby ornament, a bank of the common *Cherry Laurel* cut close so as to form a dense green ground covering. Then by way of variety the path passes between hedges of *Rhamnus alaternus* and *Arbutus*, and after that we came to a *Rose* garden, or rather a herbaceous garden planted with abundant *Roses*, *Honeysuckles*, *Clematis*, *Syringas*, *Peach* trees, *Pinks*—anything, in fact, that is attractive and capable of yielding a flower in its season. Remembering the variety of the specimens it may readily be imagined what a very delightful walk this must prove to those who are interested in trees and shrubs and flowers. I have omitted to mention that the New Zealand *Veronica Traversi*, with its pale flower, is here quite hardy and grows well under the shade. As the long path is well kept I was glad to see a bit of it under repair, and I am now able to say that a gravel walk, soft to the feet and without a weed, may be made by boiling some tar, mixing it with gravel, spreading the hot mixture 2 inches thick, and covering that layer with an inch or two of gravel. Such a path will never require weeding.

The end of the shrubbery walk brought us close to the principal entrance of the kitchen garden, where we commenced a two-hour walk—and not a lounging one—through the various houses. There are five vineries—two *Muscats* houses, two for *Hamburgs*, and a late house planted with *Alicante*, *Lady Downe's*, and *Gros Colmar*. Mr. Davies is evidently a master of the art of *Grape-growing*. He has a large *Muscats* house, whose many hundreds of bunches would average 3 lb. each, many of them weighing 6 lb. or 7 lb.

Among the flowering houses there is one containing 300 tuberous *Begonias*, most brilliant in appearance; another is devoted to *Fuchsias*, *Campanulas*, *Hydrangeas*, *Crassulas* and *Phloxes*. Another is filled with Mr. Veitch's greenhouse *Rhododendrons*, with *Taylori* in flower as well as *President*, which was sent out this year, having pale salmon-coloured corollas and purple stamens.

Another house is filled with *Ferns* and *Palms*, with the curious flaring spathe of the *Anthurium* lighting up the greenery here and there. In the same house is *Messrs. Veitch's Gymnogramma Pearcei robusta*, which received the Royal Horti-

cultural Society's First-class Certificate this year, with several other of *Messrs. Veitch's* recent introductions.

A *Camellia*-house, 70 feet long, came next, and then an *Azalea*-house of the same size, a *Bougainvillea* house, three early *Peach*-houses, and a house for *pot Vines*, which are very successfully grown here, each *Vine* in a 13-inch pot, and bearing a high average weight of *Grapes*.

In the *Tomato*-house we found the crop gone and the plants about to be cut back for fresh growth, and to bear fruit during the winter. *Cucumbers* are bearing well here in the refined society of *Gesneras* and *Eucharis*. Another house produces winter *Cucumbers*, and is now planted with *Melons*. I must not omit the house containing, among other good specimens of *Amaryliss*, a capital seedling raised by Mr. Davies. Other houses I must pass by. I suppose if a few of them were carried away by some geni of the *Arabian Nights* someone on the premises would miss them, but they are too numerous for me to enumerate them; nor must I dwell upon the pits and frames, where a vast amount of useful work is done.

I have passed on rapidly in order to mention the series of *Orchid*-houses, commencing with a house for *Odontoglossums*, another for the same coming from a warmer climate, an intermediate house; then a *Cattleya*-house with *C. Gaskelliana* in blossom, and *Lælia elegans Turneri* (true) with a good lip, and a *Moth Orchid* in blossom; then an *East India*-house, containing *Calanthe veratrifolia* tectoria in flower, without a spot in the centre, as well as *Peristeria elata* (dove flower), and a variety of *Cypripedium* (*Slipper Orchid*) in flower. Another *Lælia*-house followed, with *Cattleya Leopoldi* in flower, and a *Lycaste*-house. A house of 40 feet in length is devoted to the varieties of *Phalænopsis*, the *Butterfly Orchis*, with a number of foliage plants arranged with great taste, and *Ficus* repens covering the back wall.

KITCHEN-GARDEN.—I must be content with a brief visit to the kitchen garden. Apples and Pears are grown here on cordons planted in November five years since, and now 10 or 12 feet high, and yielding a crop every year, through the protection of what is known in the trade as "No. 3 shading." A single row of cordons was left unprotected this year, and it now carries a dozen Pears, while the protected rows bear a full crop of about seven sieves each, worth in many seasons as much as 30s. per sieve. The plan of protecting fruit trees, specially adapted as it is, to cordons and low bushes, is an old one, but it is not so common as it should be, and I may therefore mention the ease and cheapness with which it is carried out here. Two rows of cordons are planted 10 feet apart, and outside each row is a rail to carry the "shading," which also rests for additional support on a wire that runs up the centre between the two rows. The shading is left on from the first opening of the blossom till the foliage becomes sufficient to protect the young fruit. Cordons are planted 18 inches apart on walls having a wooden coping of 18 inches, to which is fastened a fish-net that hangs down in front of the trees. A wall covered with *Plums* and *Morello Cherries* has a border 22 feet wide planted with bush fruit; and wall and border are both covered with fish nets, as protection from frost and birds. Each season the nets, covering the length of 200 feet of wall, are put up by two men in a day. There are wooden uprights in front of the border, 5 feet high, and 10 feet apart, with wire running to the wall to carry the

net, and a strong wire for the same purpose runs along the wall at a height of 12 feet. Next the ground wire netting is used to prevent the ordinary net from rotting.

Mr. Davies strongly recommends the treatment of Poinsettias advocated in the *Gardeners' Chronicle* four years ago by Mr. Denning. He has planted out the same plants in the kitchen garden three years in succession. After having been cut down they are allowed to "break"; the balls are then reduced, and they are planted outdoors early in June, and taken indoors again the first week in September, when they are treated in the usual way. It is found that ten weeks of "Nature" strengthens the plants immensely. They become bushy, and produce several bracts. Solanums and Bouvardias are treated in the same manner, the former going outdoors in May when shabby, and coming in again, full of berries at the end of September. Bouvardias are turned out the first week in June, and taken in at the end of August, to flower two months afterwards.

The glory of the kitchen garden for ornament and perfume is a double row of Lavender, planted five years since, one row on each side of a central path 600 feet in length, running through the garden. At the end of August the Lavender was in full blossom. Chiswick Favourite Potato produced last year five sieves per rod, and is yielding a large crop this year, free from disease. Veitch's Main Crop Onion is well formed, has good bulbs even in this year of too much top, keeps well, and is considered by Mr. Davies to be the best Onion in cultivation. I have seen beds this year all leaf, many bulbs of Main Crop weigh here  $\frac{3}{4}$  lb. each. *H. E.*

## PLANT - LIFE.

(Concluded from p. 323.)

REFERRING to the assigned causes of variation, Mr. Dyer continued:—

"Though it is difficult to establish the fact that external causes promote variation directly, it is worth considering whether they may not do so indirectly. Weissmann, like Lamarck before him, has pointed out, as others have also done, the remarkable persistence of the plants and animals of Egypt; and the evidence of this is now even stronger. We owe, at Kew, to the kindness of Dr. Schweinfurth, a collection of specimens of plants from Egyptian tombs which are said to be as much as 4000 years old. They are still perfectly identifiable, and any one of my predecessors in this chair has pointed out, they differ in no respect from their living representatives in Egypt at this day. The explanation which Lamarck gave of this fact 'may well,' says Sir Charles Lyell, 'lay claim to our admiration.' He attributed it, in effect, to the persistence of the physical geography, temperature, and other natural conditions. The explanation seems to me adequate. The plants and animals, we may fairly assume, were, 4000 years ago, as accurately adjusted to the conditions in which they then existed as the fact of their persistence in the country shows that they must be now. Any deviation from the type that existed then would either, therefore, be disadvantageous or indifferent. In the former case it would be speedily eliminated, in the latter it would be swamped by cross-breeding. But we know that if seeds of these plants were introduced into our gardens we should soon detect varieties amongst their progeny. Long observation upon plants under cultivation has always disposed me to think that a change of external conditions actually stimulated variation, and so gave natural selection wider play and a better chance of re-establishing the adaptation of the organism to them. Weissmann explains the remarkable fact that organisms may for thousands of years reproduce themselves unchanged by the principle of the persistence of the germ-plasm. Yet it seems hard to believe that the germ-plasm, while enshrined in the individual whose race it is to perpetuate, and nourished at its expense, can be wholly indifferent to all its fortunes. It may be so, but in that case it would be very unlike other living elements of organised beings.

## VARIATION IN CULTIVATED PLANTS.

"I am bound, however, to confess that I am not wholly satisfied with the data for the discussion of this question with practical horticulture supplies. That the contents of our gardens do exhibit the results of variation in a most astonishing degree no one will dispute. But for scientific purposes any exact account of the treatment under which these variations have occurred is unfortunately usually wanting. A great deal of the most striking variation is undoubtedly due to wide crossing, and these cases must, of course, be eliminated when the object is to test the independent variation of the germ-plasm. Hoffman, whose experiments I have already referred to, doubts whether plants do as a matter of fact vary more under cultivation than in their native home and under natural conditions. It would be very interesting if this could be tested by the concerted efforts of two cultivators, say, for example, in Egypt and in England. Let some annual plant be selected, native of the former country, and let its seed be transmitted to the latter. Then let each cultivator select any variations that arise in regard to some given character; set to work, in fact, exactly as any gardener would be wanted to 'improve' the plant, but on a preconceived plan. A comparison of the success which each obtained would be a measure of the effect of the change of the environment on variability. If it proved that, as Hoffman supposed, the change of conditions did not affect what we may call the rate of variation, then, as Mr. Darwin remarks in writing to Professor Semper, 'the astonishing variations of almost all cultivated plants must be due to selection and breeding from the varying individuals. This idea,' he continues, 'crossed my mind many years ago, but I was afraid to publish it, as I thought that people would say, How he does exaggerate the importance of selection.' From an independent consideration of the subject I also find my mind somewhat shaken about it. Yet I feel disposed to say with Mr. Darwin, 'I still must believe that changed conditions give the impulse to variability, but that they act in most cases in a very indirect manner.'

"Whatever conclusions we arrive at on these points, every one will agree that one result of the Darwinian theory has been to give a great impulse to the study of organisms, if I may say so, as 'going concerns.' Interesting as are the problems which the structure, the functions, the affinity, or the geographical distribution of a plant may afford, the living plant in itself is even more interesting still.

## ADAPTATION OF FORM TO PURPOSE.

"Every organ will bear interrogation to trace the meaning and origin of its form, and the part it plays in the plant's economy. That there is here an immense field for investigation there can be no doubt. Mr. Darwin himself set us the example in a series of masterly investigations. But the field is well-nigh inexhaustible. The extraordinary variety of form which plants exhibit has led to the notion that such of our most common plants as the garden pea, &c. are not so much the result of an indifferent variation. No doubt, as Mr. Darwin has pointed out, when one of a group of structures held together by some morphological or physiological nexus varies, the rest will vary correlatively. One variation then may, if advantageous, become adaptive, while the rest will be indifferent. But it appears to me that such a principle should be applied with the greatest caution, and from what I have myself heard fall from Mr. Darwin, I am led to believe that in the later years of his life he was disposed to think that every detail of plant structure had some adaptive significance, if only the clue could be found to it. As regards the forms of flowers an enormous body of information has been collected, but the vegetative organs have not yet yielded their secret to anything like the same extent. My own impression is that they will be found to be adaptive in innumerable ways which at present are not even suspected. At Kew we have probably a larger number of species assembled together having been found anywhere on the earth's surface. Here, then, is ample material for observation and comparison. But the adaptive significance will doubtless often be found by no means to lie on the surface. Who, for example, could possibly have guessed by inspection the purpose of the glandular bodies on the leaves of *Acacia peltata*, and on the pulvinus of *Cecropia peltata*, which Belt in the one case, and Fritz Müller in the other, have shown to serve as food for ants? So far from this explanation being far-fetched, Belt found that the former 'tree is actually unable to exist without its guard,' which it could not secure without some attraction in the shape of food. One

fact which strongly impresses me with a belief in the adaptive significance of vegetative characters is the fact that they are constantly adopted in almost identical forms by plants of widely different affinity. If such forms were without significance one would expect them to be infinitely varied. If, however, they are really adaptive, it is intelligible that different plants should independently arrive themselves at identical appliances and expedients.

## BOTANICAL LABORATORIES.

"Although this country is splendidly equipped with appliances for the study of systematic botany, our universities and colleges fall far behind a standard which would be considered even tolerable on the Continent in the means of studying morphological and physiological botany, or of making researches in these subjects. There is not at the moment anywhere in London an adequate botanical laboratory, and though at most of the universities matters are not quite so bad, still I am not aware of any one where it is possible to do more than give the routine instruction or to allow the students, when they have passed through this, to work for themselves. It is not easy to see why this should be, because on the animal side the accommodation and appliances for teaching comparative anatomy and physiology are always adequate and often palatial. Still less explicable to me is the tendency on the part of those who have charge of medical education to eliminate botanical study from the medical curriculum, since historically the animal histologists owe everything to botanists.

"In the seventeenth century, as I have already mentioned, Hooke first brought the microscope to the investigation of organic structure, and the tissue he examined was cork. Somewhat later, Grew, in his *Anatomy of Plants*, gave the first germ of the cell theory. During the eighteenth century the anatomists were not merely on a hopelessly wrong tack themselves, but they were bent on dragging botanists into it also. It was not till 1837, a little more than fifty years ago, that Hensle saw that the structure of epithelium was practically the same as that of the parenchyma plantarum, which Grew had described 150 years before. Two years later Schwann published his immortal theory, which comprised the ultimate facts of plant and animal anatomy under one view. But it was to a botanist, Von Mohl, that, in 1846, the biological world owed the first clear description of protoplasm, and to another botanist, Cohn (1851), the identification of this with the sarcode of zoologists.

"I do not myself believe that any better access can be obtained to the structure and functions of living tissues than by the study of plants. However, I am not without hopes that the serious botany in the laboratory will be in time better cared for. I do not hesitate to claim for it a position of the greatest importance in ordinary scientific education. All the essential phenomena of living organisms can be readily demonstrated upon plants. The necessary appliances are not so costly, and the work of the class-room is free from many difficulties with which the student of the animal side of biology has to contend. The splendid laboratory on Plymouth Sound, the erection of which we owe to the energy and enthusiasm of Professor Ray Lankester, is open to botanists as well as to zoologists. At Kew we owe to private munificence a commodious laboratory in which much excellent work has already been done. And this Association has made a small grant in aid of the establishment of a laboratory in the Royal Botanic Garden at Peradeniya in Ceylon. It may be hoped that this will afford facilities for work of the same kind as has yielded Dr. Treub such rich harvest of results in the Buitenzorg Botanic Garden."

**NECTARINES AND EVOLUTION.**—In Downing's *Fruits and Fruit Trees of America* he says, "The Nectarine is known in Northern India, where it is called *moondla aroo* (smooth Peach). It appears to be only a distinct accidental variety of the Peach, and this is rendered quite certain, since there are several well-known examples on record of both Peaches and Nectarines having been produced on the same branch, thus showing a disposition to return to the natural form. Nectarines, however, usually produce Nectarines again on sowing the seeds; but they also occasionally produce Peaches. The Boston Nectarine originated from a Peach-stone." Is this a proof of an individual creation, or does it favour evolution? Are there any other cases of a similar nature [Plenty, *Ed.*]. See London *Gardeners' Magazine*, i., p. 471; *g.v.*, p. 53. *W. M. B.*, Pittsburg Pa., in 'English Mechanic.'

## CULTURAL MEMORANDA.

## IMPATIENS GLANDULIFERA.

For woodland walks and wild places, or shrubby borders, this Balsam forms a very striking object, as it towers up from 4 to 6 feet high, and sends out numerous branches from base to summit that produce a constant succession of flowers of most curious shape and appearance. This species gives no trouble in raising young plants, as seeds are shed with great freedom about the parent plant, and readily germinate the following year. All that is necessary is to limit the number of plants by thinning them out, and leaving them the proper distance apart if they are to be grown in masses, but being so large they look very well as isolated specimens. As a screen in gardens the plant fulfils a useful purpose, and growing quickly it soon forms a blind, which might be rendered still prettier by *Nasturtiums* being sown near, so that they may climb amongst the plants.

## GYPSOPHILA PANICULATA.

Although this *Stitchwort* is not at all showy, it is exceedingly useful for cutting to form a basis in vases or stands, or to mix in any arrangement of flowers, as the sprays or heads are so light that they help to set off the whole to advantage. The plant, when in bloom, grows to a height of 3 feet or so, and forms a dense bush with its many-branched stems, with their thread-like stalks bearing innumerable tiny white blossoms. These seed freely, and plants may be readily raised in that way, or divided, the time for doing this being just when they start to grow in the spring. *J. S.*

## LISIANTHUS RUSSELLIANUS.

This showy plant is now referred to the genus *Eustoma*, but whatever its botanical position, there is, when well grown, no doubt about its excellence as a decorative plant; its comparatively large rich violet-blue flowers are freely produced from the axils of the leaves towards the ends of the stems, which are slender, round, and furnished with rather small, ovate, lanceolate, glaucous green leaves, sessile, and opposite; altogether a neatly-balanced plant. Several good examples are now in flower at Ashburnham Place, and Mr. Holmes' mode of culture differs somewhat from that usually practised. He sows the seeds early in February, in the ordinary way, in an intermediate temperature, and as soon as the seedlings are fit to be handled, they are pricked out into 48's, several plants to a pot, similar to what is practised with *Rhodanthes*; they are afterwards carefully tended in the way of watering and airing, and grown all through in an intermediate temperature; the result is neat well-flowered specimens, about a foot in height, in about six months from time of sowing. A light rich soil, inclined to be peaty, suits them well. *F. R.*

## DICTAMNUS FRAXINELLA.

This is one of the finest old border plants in cultivation, and yet it is not seen in many gardens; but now that the summer bedding out fever is lower than it was, it is to be hoped that such good things as the one referred to will again assume their proper place. In suitable soils the *Dictamnus* grows from 2 to 3 feet high, when in flower, and forms a bold striking object when the plant has attained size, which it is not long in doing, as the crowns quickly spread and increase in strength if proper room be given for the branches and leaves to fully develop, and the roots be not robbed by having others too near them. Besides the ordinary form, which has pale purple flowers with a deeper pencilling on the petals, there is a white variety, which is not so robust in growth, but which is a very desirable kind to have; both sorts are agreeably and highly perfumed, and the spikes are in favour with some for drying and using as scent. There are two ways of propagating the *Dictamnus*—the one from seed, and the other by division of the crown or roots; and if the latter method is chosen the best time for doing it is

in spring, just as the plants are starting to grow, when a portion may be sliced off by using a sharp-edged spade or trowel; or the plant may be taken bodily up, and the early fleshy roots cut into lengths and then placed in sharp sandy soil under a hand-glass. If seed be sown, that may be treated in the same way as regards soil and shelter, and is best put into the ground as soon as ripe, as then it germinates without loss of time.

## PLEUROMA MACRANTHUM VAR. FLORIBUNDA.

When this plant is grown in a pot, it makes a fairly good specimen, and flowers freely, but gives but a very imperfect idea of what it is capable of when planted out, where, if given a good root-run, it will quickly grow into a large specimen, producing its purplish-blue flowers, more or less, for six months of the year, which under those conditions are of great substance, and differ from the prevailing colours of conservatory plants. A position affording plenty of light is to be preferred, yet it need not be where the direct sunshine falls; indeed, plenty of light without being fully exposed to the sun seems to answer best. In such a position, about two years ago, I put out a small specimen, which has now grown into a nice plant about 7 feet high, and of proportionate width, which has been flowering freely for a long time; many of the flowers are nearly 7 inches across. It is planted in the usual mixture of peat and loam, with enough coarse sand to give free outlet for the water, but I do not think the plant is very particular as to soil. Almost anything that is friable in its nature will do. It is not well to give an excess of water at the root; therefore, a compost which can be maintained steadily moist is best. The plants may have a periodical washing with the hose or garden engine, to cleanse the foliage, but daily syringing should be avoided, as this seems to injure the leaves. It is easily increased from cuttings in the usual way in a mild propagating-pit, taking care not to let them either shrivel or damp off. Besides our plant, I remember seeing one planted out in the Botanic Gardens at Glasgow, where it was doing grandly. From what has been said it will be seen that this is eminently suited for planting out in winter gardens or conservatories, as independently of its beauty when flowering, it is evergreen, having distinct characteristic foliage of an ornamental type. *F. Ross.*

## NEW OR NOTEWORTHY PLANTS.

## PASSIFLORA MIERSEI\* (FIG. 46.)

We are indebted to the courtesy of Professor Maxime Cornu, the Director of the Jardin des Plantes, for a specimen of this pretty little Brazilian Passion-flower. We first met with it among the collections of the late Mr. Miers, to whom we dedicated the species; but we have not previously seen living examples. The arrangement of the coronal threads differs slightly from that shown in the analysis in the *Flora Brasiliensis*, and in spite of this minor discrepancy there can be no doubt as to the specific identity of Professor Cornu's plant. Referring the botanical reader to the description in the work cited, it may suffice here to say that the species is an elegant one, with slender wiry stems, and very free-flowering, the leaves (of which one is shown in the figure) claret-coloured on the under surface; flowers white, flushed with pink; the outer coronal threads whitish, barred with purple at the base; the inner threads violet or deep purple. The ovary is oblong-obtus, glaucous, green, and marked with ten longitudinal yellowish lines. *M. T. M.*

## ODONTOGLOSSUM MACULATUM DUVIVIERIANUM, n. var.

This appeared among numerous specimens of *Odontoglossum maculatum*. It has lemon-coloured sepals and petals, all spotted with brown, and a

whitish-yellow lip, spotted with same reddish-brown, which has a very light hue of sepia. The callus and bracts, and shape of the lip, prove it to be *O. maculatum*, not *O. cordatum*, though the sepals and petals are rather long. I had a fine inflorescence, with six quite fresh large flowers, kindly sent me by M. L. De Smet-Duvivier, Mont St. Amand-lez-Gand. It is a beauty. *H. G. Rehb.f.*

## ONCIDIUM ROBUSTISSIMUM, n. sp.\*

This is an uncommonly intricate, critical species. It belongs to the group of the *Pulvinata*, including *O. divaricatum*, *pulvinatum*; and *sphegiferum*. It is, however, quite distinct at first sight in its strong, straight rhachis, the side branches of which are not zigzag at all, but straight, too. The flowers are larger, and the lip has the anterior part of the blade broad as the lateral ones. The sepals and petals are yellow at the top, brown at the inferior part. The lip has the rounded serrate lateral lacinia, as well as the anterior emarginate one, with broad cinnamon-coloured stripes, transverse in the anterior, parallel or oblique to the outside in the lateral ones. The transverse wings of the column are striped with numerous light brown stripes, which are easily overlooked. Bulb strong, short, elliptic, aciculate. Leaf of the neighbours [allied species?] much keeled outside under the mid-line. It was imported from Brazil, and kindly sent to me by Mr. F. Horsman, Hollybrook, Colchester. *H. G. Rehb.f.*

## THE GUM CISTUS.

SEVERAL kinds of Gum Cistus are very ornamental in warm and sunny gardens during the months of June and July. The worst of them is that none of them are very hardy, and the flowers are very short lived, lasting only a few hours, and are therefore useless for cutting. On the other hand, the plants are easily reproduced from cuttings, and easily preserved by a slight protection in winter, also most of them flower very freely, even when the shrubs are very small—not more than a year old.

*Clusius*, whose information was collected nearly three centuries ago, accurately describes many kinds of Cistus, from which Parkinson selects only three "as fit for this our garden," translating almost literally the description of *Clusius*. They are, first, *Cistus mas*, our *C. villosus*, identified by Sibthorp with the male Cistus of Dioscorides, and of Theophrastus, who spells the name *Cisthus*; secondly, *C. femina*, our *C. salviifolius*, the female Cistus of the same authors; and, thirdly, *C. ledon*, our *ladaniferus*. Of more recent authorities for the genus Cistus, Sweet published in 1825 a monograph of the Cistaceae, in which fifty-two species or varieties of Cistus then in cultivation are figured in colours and described. This work has been superseded by a more complete monograph in Willkomm's *Joanes* (Leipsic, 1856), in which all Sweet's figures are reviewed.

Several of the best Cistuses now in cultivation, as well as some of those figured by Sweet, are known to be, or suspected to be, hybrids of cultivation. Here are a few of the most desirable kinds:—The largest of all is *Cistus ladaniferus*, the old Gum Cistus; the *Ledon angustifolius* of *Clusius*, a native of Spain and Portugal and South-eastern France, *Clusius* tells us that he has ridden for twenty miles in a line through thickets of this bush on the slopes of the Sierra Morena, and that it supplies the inhabitants of those parts with most of their faggot wood. He also observed the variety with pure white unspotted flowers, which we still have in cultivation. *C. cyprus* seems now commoner in English gardens than the last mentioned, being figured under the name of *C. ladaniferus* in *Bot. Mag.*, t. 112, the most obvious distinction being that *C. cyprus* bears

\* *Oncidium robustissimum*, n. sp.—Aff. *Oncidium divaricatum*, Lindl.; ramis ramulisque fortibus rectis, apiculis tepalique cuneato-oblongis acutis; labelli lacinia lateralibus semi-ovatis serratis, lacinia antica cuneato-dilatata elliptica emarginata, lacinia lateralibus equilatis, callo piloso in basi; columnae albis transversis oblongis. Ex Brasilia imp. et mis. ex Horsman, Colchester. *H. G. Rehb.f.*

\* *Passiflora Miersii*, Masters, in *Flora Brasiliensis*, vol. xiii., part 1, p. 599, *Passiflorea* spec., n. 42.

several flowers in a cyme, the flowers of the other species being always solitary. It is thought to be the *Ledon cyrium* of Clusius, though it must be noticed that in his otherwise accurate description he omits to mention the purple spot on the petals, which he says are white. He tells us that he received seeds of the plant under the name which he gives it from Italy, and that he and others raised plants of it for their gardens in Belgium, where it has probably been in cultivation ever since as a supposed Cyprian plant. Its native country seems never to have been questioned, but E. Boissier, our best informant about the plants of the Levant, failed to find it wild either in Cyprus or anywhere else, so that its history is somewhat uncertain. Lamarck's *Encyclopædia*, published in 1786, is accepted as the modern authority for the name. Another beautiful *Cistus*, *C. purpureus*, referred to the same authority, has a still more obscure history, for its native country is not even mentioned. Willkomm says it is "probably a native of the East," and Boissier observes that, as it never bears even a seed capsule, it may be a hybrid. He never saw even a pretended wild specimen of it. Though not a free flowerer, its habit is good, and it should be in every collection. A rather new *Cistus* is sold as *C. lusitanicus*. No authority for the name is given, and I cannot trace it beyond Backhouse's nursery, but I consider it decidedly the best *Cistus* in cultivation. The flowers resemble those of *C. ladaniferus*, being nearly as large, with smaller spots, and are borne in great profusion on a very dwarf and hardy shrub.

Of the white flowered kinds the hardiest is *C. salvifolius*, which forms large bushes everywhere in the neighbourhood of Biarritz, and has a very wide natural range. *C. hirsutus* is also very profuse of its flowers, which it produces on very dwarf shrubs. It is often wrongly called *C. Florentinus*, a hybrid kind, which has much smaller flowers, few in number, and in my garden is not worth the room it takes. *C. laurifolius* has large flowers, and is hardy, but its leaves and habit are coarse and untidy. *C. corbariensis* quite covers the bush with its flowers but for a very short period.

Of the pink-flowered kinds *C. crispus* is easily grown; its flowers are vivid in colour, and are produced for long. Of the varieties of *C. villosus* (which is called by Willkomm *C. polymorphus*), *C. creticus*, which that author makes a distinct species, is perhaps the best.

*Ladanum*.—The following notes have been compiled from writers of widely different dates concerning ladanum, the resin, or gum, of the *Cistus*, which was made into an important aromatic drug in ancient and medieval times. It is first mentioned by Herodotus amongst the products of Arabia. He says that ladanum, which the Arabians call "ladanum," was collected from the beards of goats, to which it adhered like glue from the shrubs on which they grazed, and that it was very much used by the Arabians for incense. Dioscorides repeats this statement; and Pliny, besides telling us about the goats' beards, gives other particulars. He says the best ladanum came from the North-west of Arabia, but that a good quality was made in Cyprus, where it was collected by sweeping the bushes with a rope held at both ends, to which the resin adhered. The price of the finest kind was about half-a-crown a pound (*xl assas*), which seems surprisingly low, considering the labour of collecting, and the great value of some of the costly *naves*; but numeral letters are especially liable to be mistaken. Pliny also tells us that the drug was much adulterated, and that the genuine might be recognised by its wild smell, being "redolent of a desert;" also by its containing bits of rock, and not dust, which was often added. He also says that the gum adhered to the beards of the goats whilst browsing on Ivy (*Hedera*), evidently confusing the Greek word "Kissos" (*Ivy*) with "Kistos" (the *Cistus*). In medieval times we find the scene of the collection of ladanum changed to Crete. Clusius gives some extracts from the travels of Peter Belon, who visited Crete about half a century before his time. Belon saw ladanum being

collected on the mountains by raking the bushes with an *ergasteri*—i.e., a "working tool"—a kind of rake with leathern teeth. [A specimen was exhibited some years since at the Linnean Society, and which is now in the Kew Museum.] The labour of collecting, which had to be endured in the hottest sunshine, was too great for any one except the Greek monks. This ladanum, Clusius says, was imported to Spain through Africa, much adulterated, though the Spaniards, as he suggests, might collect it in abundance for themselves from their endless thickets of *Cistus*. Dodoens, in his *Herbal*, where he speaks of the virtues of ladanum, cites the same authority of Belon about its collection. He adds that it was called in the shops in his time "labadanum," per-

stated in botanical works that it is collected in Crete from *C. creticus*, a kind closely allied to *C. villosus*, if not a variety of it. The two species which have the widest range on continental Asia are *C. villosus* and *C. salvifolius*. In our English gardens these are amongst the least gummy and fragrant of the whole genus; but in the hot climate of the Levant the resinous secretions are far more abundant. Still Clusius was right in saying that more and better ladanum might easily have been collected in Spain than in Crete, and the name ladaniferus may have been applied by Linnaeus to a large *Cistus* of Spain, not because it was supposed to be the source of the drug of commerce, but from the large quantity of ladanum which exudes from its surface. *C. Wolley Dod, Edge Hall, Malpas.*

## ORCHID NOTES AND GLEANINGS.

### LISSOCHILUS GIGANTEUS.

This Orchid, towering above its fellows, merits more than common notice. Professor Reichenbach (see *Gardeners' Chronicle*, ante p. 616) gives a very full diagnosis, with interesting details of the plant that flowered in Sir Trevor Lawrence's collection (see fig. 83, p. 649, May 10 last)—a plant, by the way, with which he had formed an acquaintance before the time of flowering in one of his visits to our country. Probably I might be allowed to supplement that excellent description by giving details of, without doubt, the most wonderful plant in this country, splendidly grown, as reported by Mr. Robert Todd in your last issue, and exhibited at the great show held at Glasgow under the auspices of the International Exhibition.

In looking at the plant as it stood in the Grand Hall confronting the improvised throne upon which the Queen sat only a few weeks previously, and which still remains as one of the sights of the Exhibition, it was a giant among its flowering fellows. It certainly did not reach the 16 feet altitude which our learned Professor takes as the observation of collectors on the spot, but it much over-reached the Burford Lodge specimen. I measured its spike, and found it to be 7½ feet long, bearing from beginning to end twenty-six flowers.

The plant itself is terrestrial Phaius-like in its character, with the ripened stools level with the fleshy roots, and with the soil in which the plant was growing. Some old fellow, without much Orchid knowledge, declared it to be a *Carculigo*, and its linear-lanceolate leaves, although much taller, give somewhat of a colour to the suggestion, but in diagnosing it we find it to be more Phaius-like, with a prominent keel down the centre of the leaf, and from three to four subsidiary keels in the division. In fact it looks more like *Sparganium racemosum*, being entire at the edges, and of a pale green hue. The matured leaves are fully 6 feet long, amplexicaul at the base, and from 2 feet upwards, as we have said, linear lanceolate. The flower peduncle resembles that of *Zygopetalum Mackayi*, being quite glabrous and round as a Sugar-cane, with internodes 12 to 18 inches apart, more like bracts, as well described by Professor Reichenbach, only the plant in question throws up its peduncle half as tall again as does Sir Trevor's plant.

The flower differs from that in the described example at p. 616 in being almost uncoloured. It is exceedingly striking, however, and is as ornamental as any novelty in recent times. It is not unlike the colour of a *Phalenopsis Schilleriana*, but it is far more interesting. Its sepals are inconspicuous, 1 by ½ inch, spatulate, and carelessly reflexed. Petals very prominent, 1½ by ¾ inch, obovate. Labellum very conspicuous, sandal-like in formation, with a labiate extremity gathered up in the centre like a well-made sandal, with a bright orange blotch at the base of the column, with three linear lines of a russety hue, as it were, pencilled out in parallel lines from base to extremity. The column itself is arching and all but linear, with

FIG. 46.—PASSIFLORA NIESSII: WARM GREENHOUSE CLIMBER: LEAVES PURPLE BENEATH: FLOWERS WHITE, FLUSHED WITH PINK: CORONA PURPLE.

haps to prevent its being mistaken for ladanum—a confusion, and which even the accurate Clusius was not exempt from making. Tournefort, who visited Crete about the year 1700, describes the same mode of gathering ladanum as was witnessed a hundred and fifty years earlier by Belon. In more recent times the excessive adulteration practised has brought the drug into disrepute, and it is no longer imported into Western Europe, though still in use in Turkey.

As regards the particular species of *Cistus* from which ladanum was collected, it is probable that more than one kind furnished it. It is generally

conspicuous pollen masses confronting the onlooker. This particular variety is nearly all lilac; if the colour is high-toned at all it is at the back of the sepals, which verge into rose colour. The plant has been in Mr. Bullen's possession for about eighteen months, was introduced from the river Benue, about the Congo district, by Mr. Henderson, one of our Glasgow merchants, is in the height of vigour in an 11-inch pot, and, of course, is much prized. It is the only one introduced alive at the same time as was Mr. Linden's, and has been well cared for by an excellent orchidist, for these unique specimens we owe to the skill of Mr. Bullen. B.

#### ZYGOPETALUM BRACHYPETALUM, Lindl.

*Zygopetalum brachypetalum* was described by Lindley in 1844 (*Bot. Reg.*, xxx., *Misc.*, p. 9), from a specimen received from Mr. Waterhouse, of Halifax, in 1840. The flowers were described as most like those of *Z. intermedium*, but less than half the size, the sepals and petals very much more brown than green, in consequence of the blotches running together, and the lip covered with blue veins and spots. The type specimen and a coloured drawing of a single flower is preserved in the Lindley Herbarium at Kew. In the Orchid-house at Kew at the present time is a similar plant, the leaves 18 inches long, by only 6 to 7 lines wide, the flowers  $2\frac{1}{2}$  inches in diameter, the sepals and petals similar, and the lip even more suffused with blue than in Lindley's sketch. It is a very handsome plant, and although the flowers are a shade larger than Lindley's plant, I believe both represent the same species. The lip is not hairy as in *Z. intermedium*, and I should describe it as nearest to *Z. Mackayi*. The differences between the two are not very great, and might possibly be found to break down if a large series of specimens were examined. The species, like its allies, is a native of Brazil. R. A. R.

#### CATASETUM RUSSELLIANUM, Hook.

This rare *Catasetum* was originally introduced from Guatemala, in 1838, by Mr. Skinner, and flowered in the collection of the Duke of Bedford at Woburn Abbey. From thence it was transmitted to Sir William Hooker, and by him figured and described at t. 3777 of the *Botanical Magazine*, under the above name. The plant has the general appearance of the genus, with swollen conical pseudobulbs, and broadly lanceolate leaves about a foot long. The flowers are large, and borne in a dense pendulous or arching raceme, and although the pallid whitish-green flowers have no striking colours to recommend them, yet their appearance is exceedingly graceful. The inflated or pouch-shaped base of the lip and fimbriated front lobe are peculiar characters, but the most remarkable feature of the plant is the total absence of tendrils or cirrhi on the column; and the remarkable way this is connected with the fertilisation of the flower I have been able to make out from a fine plant which has just flowered in the Kew collection. The part played by these tendrils in causing the forcible ejection of the pollen, when an insect visits the flower, has been pointed out by Darwin in the case of other species of *Catasetum*; but the singular feature of *C. Russellianum* is that its column is altogether without tendrils, and its pollen is not forcibly ejected, and yet the plant is as essentially a male Orchid only as any of the tendrilless species; for the ovary and stigma are not developed. As it is certain that the pollen has to be removed, and carried away to a flower of the other sex (at present apparently totally unknown), I was anxious to find out by what means this was accomplished. On introducing a pencil into the flower, in the same way as an insect must necessarily enter, I touched the gland-like base of the pollinium, which lies flat along the column, when it suddenly sprang backward from an elastic hinge at the junction of the stipes with the gland, the highly viscid under surface of the latter being now placed in so prominent a position that it would infallibly come in contact with the insect on its backing out of the flower, even if it did not become firmly glued to it in the very act of springing

backwards. The point, however, to be noticed is that the gland simply flies backwards, while the rest of the pollinium remains *in situ*. Four flowers were successively tried, and always with the same result, though on discovering the mechanism I found it possible to hold the pencil at such an angle that the gland, when touched, flew back on to the pencil, and became instantly attached to it—probably what takes place when an insect visits the flower. In the first trials the glands did not become attached to the pencil, perhaps because not held at the right angle, but it enabled me to be certain that the pollen is not forcibly ejected. *C. Bungeorhii* being in flower in the same house, I examined it, and found one of the tendrils curved round close to the column, the others standing forward in the centre of the flower. The former proved quite functionless, as Darwin showed to be the case in *C. saccatum*, but on the other being touched the pollinium was jerked out of place, not, however, out of the flower, but on to the apex of the lip, as I have also seen to be the case in *C. luridum*. The phenomena of fertilisation in this singular genus are certainly most remarkable, and it is much to be hoped that the female plants of *C. Russellianum* and *C. Bungeorhii* will ere long be forthcoming in some collection. R. A. Rolfe.

## NURSERY NOTES.

### MR. G. BUNYARD AT HOME.

We meet with this estimable Kentish nurseryman so frequently everywhere—at exhibitions, conferences, and similar gatherings—where fruits especially are concerned, that it does seem like a singular experience to meet with him, if not upon his native heath, at least upon his limestone downs, whereon, although exposed to all the winds and storms of heaven, fruit trees seem to thrive as if exposure and lime were absolute essentials to health and robustness. The mist hangs thickly over Kentish hills and valleys as we glide through fields, gardens, pastures, orchards, and hop plantations, and it is not until the train is close upon Barming station, just outside of Maidstone, that we are enabled to discern the wretched plight presented by the Hops, which here have not a flower upon them to gather. Close by are some fine Cherry orchards, which display rude health and luxuriance, and assuming the crop has been as Cherries have been elsewhere, then must these fruits have been as profitable as Hops are the reverse. And whilst ruminating upon the nature of such an interesting illustration of the value of fruit as a permanent crop as compared with Hops, the train runs into Barming station, and there stands Mr. Bunyard waiting our pleasure.

The Allington Nursery, which has now grown to be of great dimensions, and severely tests the pedestrian abilities of visitors, especially when the sun shines out hotly, is of a gigantic U-shape, one side of the letter abutting upon Barming station, from which there is immediate entrance to the nursery, whilst the other side is a mile away, out towards Maidstone, and from the base of the letter there is a grand look-out over the range of chalk hills, which, known as the back-bone of Kent, shut out the sea view. All the same, it is obvious that with no shelter nearer on the east side, the nursery must at times be swept by fierce cold winds, and perhaps the wonderful health and robustness of the stock owes some of that sturdiness to the ample exposure to which it is subjected, as also to the splendid cultivation given. From the Barming side the ground gradually ascends, and the slope is literally covered with wonderful breadths of Apples, Pears, Plums, and Cherries, making their second year's growth, and doing so admirably, as to elicit the warmest commendation. Although we have had the weediest season for a decade, the ground is as clean as a new pin, thanks chiefly to the use between the tree rows of the light American horse-hoe, with its half-dozen cutters, which is in almost constant employment. To have the soil so clean amidst trees of two years' growth, especially commended for Northern culture. In the

such a season as the passing one has been, is indeed a triumph of nursery cultivation. But then how well is that labour repaid by the splendid growth seen everywhere. Of course, the ample moisture of the present year has been helpful in that direction, but everywhere on maidens, or older trees, no matter on what kind of stock, there is the same grand growth—and hard, woody, not pithy growth.

Perhaps better growth has never been seen than is now evident, and which the more recent warm weather is so assisting to mature. Now, one product of the excessive heat and drought of last year was the remarkable development of fruit-spurs in all directions upon maidens, so that myriads of Apples and Pears; but especially of the former, are fruiting wondrously, even though but in their second year's growth. To illustrate this feature, Mr. Bunyard draws our attention to a row of choice Crabs, an ordinary Crab stock, all in beautiful fruit, and showing how effective such kinds as the Mammoth, Transparent, Hyslop, The Fairy, John Downie, and the old rich-coloured Siberian; may be, when in fruit, even for decorative uses only, whilst the fruits must possess some considerable commercial value when properly preserved.

Possibly some day we may get a race of very delicious Apples from these Crabs, which shall be as hardy, and as beautiful. But the Apples grow in interest as one gets amongst them, and Ribston Pippin, for instance, exhibits such development for two years as makes one smile at the thought that it is an exhausted variety. Ringer is a kind not well known, but here fruiting with great precocity, and strongly recommended to take the place of Lord Suffield on poor soils, as it is hardy and robust. But Lord Suffield, once so famous, seems in danger of being deposed from his pride of place in other directions, as, for instance, we look at that grand Apple, Potts' Seedling, so fine and so good, and cropping here so wonderfully in these little trees. Mr. Bunyard is very sweet upon Pott's Seedling, although it enjoys hardly a euphonious designation, but in a nursery and with an honest fruitist, an Apple is an Apple for all that; and Potts' Seedling is one of the best. Lord Grosvenor is one of the Suffield competitors, of which Mr. Bunyard speaks in the highest terms, and indeed its wonderful cropping qualities and grand fruit speaks for itself. Still Lord Suffield is wonderfully good on tiny trees, especially on the English Paradise, the chief Allington dwarfing stock for Apples. Then Grenadier is another wonderful Apple of the same tribe—a noble-looking fruit, the little trees of which are laden with splendid specimens, and ample evidence is afforded that this is one of the coming culinary favourites, for it is as firm of flesh as it is free in cropping. Perhaps the premier Apple of the nursery just now in the matter of precocious fruiting is the new Bismarck, very little trees carrying from twelve to sixteen fine fruits, and presenting really fruit wonders. What a fortune might not be found in an acre or two of this superb Apple! The fruits are large, slightly conical, of a deep blood-red colour, carrying good bloom, and on the stem side resembling handsome Norfolk Beefings. It is an Australian introduction, and should rank amongst the most formidable competitors of the American sorts in a few years. Manx Codlin is also finely fruiting in this way, so is the handsome Duchess of Oldenburg, the well-known Cellini Pippin, Beauty of Kent, very fine, and Stirling Castle.

An Apple too seldom met with, Golden Spire, is another of the early culinary sorts which fruits finely, and its deep rich hue when ripe should make it sell well. A new Apple, Tyler's Hermit, presents the form of fine King of Pippins, allied to the quality and stoutness of habit of the Blenheim; and Mr. Bunyard forecasts for it a great future, as a beat upon the latter, as it is of fine flavour, fruits early, and is a robust tree. Small's Admirable, a fine hardy Hawthornden, is good, so also is Saltmarsh's Queen, literally a regal Apple, and Domino, a fine, hardy kind, capital in shade, and a free cropper. This is especially commended for Northern culture. In the

matter of colour no Apple at present seems to excel Colonel Vaughan, small trees being here and there laden with blood-red fruits, although Worcester Pearmain runs it hard for colour and prolificacy; as does also the new and beautiful Lady Sudeley. A beautiful Apple, yet little known, is Okera, a Swedish variety, the fruits resembling the Dartmouth Crab, but much finer, and richer in colour. This is of good flavour and should make a popular dessert variety. So, too, Histon Favourite is another yet comparatively unknown kind, not unlike the Stirling Castle, but is a much better keeper. The new things in Apples found at Allington are so good generally as to indicate how needful it is to be cautious in assuming that old kinds are essentially the best. Mr. Bunyard is much pleased with Laxton's Schoolmaster, as a fine early free fruiting kind, and one which we may well wish to see very universally abroad. A collection of dwarf bush trees in pots plunged in litter in a sheltered place, all grandly fruiting, affords evidence of the way in which the finest samples may be obtained, especially if run in under glass to finish up. Of these Potts' Seedling, Golden Noble, Tippet's Incomparable, like to the Costard, but much finer, and deeper coloured; Cox's Orange Pippin, and many others, are in full fruit.

In the orchard-house a few trees of Emperor Alexander, in pots, carrying wonderful fruits, show what glass protection will do to enable Apples to finish.

But we must turn to some other fruits, for in the course of our perambulations, as an eminence is reached overlooking a wide area of trees, Mr. Bunyard with a wave of the hand, as though he were a general commanding his legions, points here to a big regiment of thousands of Victoria Plums, there to another of The Czar or Diamond, still further to a high quarter of Cherries, and anon to vast numbers of Pears or Apples, or perhaps to huge breadths of stocks mustered here, till we almost expect to see the whole army assume the movement of great Birnam Wood and proceed to active evolutions. Happily the illusion is soon dispelled because we are instantly hurried away to see such breadths of Peaches and Nectarines, Plums and Pears, and Apples too, trained as cordons or for walls and espaliers. The former trees are all fan-shaped, of course, and superbly wooded stuff; the latter are chiefly horizontal or single cordons, the horizontal trees showing from two to six tiers of branches, to suit anyone's pocket; indeed with half standards a Pear or Plum wall might be covered almost at once. In the orchard house a grand lot of standard Peaches show what may be done also for furnishing the tops of high walls, or rather high Peach-houses. Pears are not in such good fruiting form as Apples this year, but still many kinds have capital crops. Pitmaston Duchess, Beurré Clairgeau, the latter full of rich colour, are fruiting heavily. The trees, however, show no lack of vigour—even on the maiden breadths the growth is excellent. Large breadths of both Apples and Pears as maidens on Paradise and Quince, not only show grand growth, but really wonderful takes, and this excellence Mr. Bunyard attributes chiefly to the great care exercised in growing stocks, as well as in selecting them. The bulk of the stocks are raised at home, hence it is easy, especially in the case of the dwarfing stocks, to eliminate any which, prior to budding, may appear to be of an unsatisfactory character.

One little matter, apparently trifling, yet suddenly leads conversation into the realms of chemistry. Mr. Rivers recently advocated an analysis of soils ere planting fruit trees. Mr. Bunyard pointed to a row of maiden Apples, adjoining a breadth of Plums, and invited us to remark upon their specially strong growth. "Now," he said, "I have found, wherever we have unwittingly planted a Pear stock amongst Apples, or an Apple stock amidst Pears, or where rogues have, as it were, dropped amongst honest rows—that the rogue always in such case grows stronger than would result if amidst his own fellows. "Why so?" we ask. And the reply is, "Without doubt each kind of fruit abstracts some diverse constituent from

the soil; and although most soils, if well cultivated, contain the needful constituents for all, yet when a single tree is planted amidst others, as in the cases mentioned, that one has a monopoly of those elements which it needs to promote growth, and is consequently all the stronger for that monopoly. Possibly the action of the more largely grown variety assists the single rogue in getting a good share of the needs of existence by thus causing other elements to become converted into vegetable fibre."

Of course, this fine nursery out on the Kentish hills is not entirely devoted to fruit culture; we are rather surprised to find Coniferæ and Rhododendrons, Roses, and forest trees, alike thriving remarkably well. We may, however, only stop to notice that beautiful silvery-blue Conifer, *Abies nobilis* glauca, of which there are some handsome specimens, as one worthy of special regard; and the very pretty little dwarf *Spiræa Bumalda*, neat little bushes, covered with rosy-pink flowers, and not more than 12 inches in height—a real shrub gem. But just now, what with essays and conferences, speeches and meetings, the horticultural air is replete with talk about fruit culture, and as Mr. Bunyard is essentially a fruit cultivator for the million in the matter of trees, the subject of hardy fruits dominates everything else. Therefore, having had a peep into that delightfully cool, thatched fruit room, and secured a little very needful rest in the adjoining office, where the telephone puts us into communication with the shop in the town, 2 miles away, there is a temporary settling down to serious talk, and Mr. Bunyard meekly submits to be put through his paces on the subject which is just now uppermost.

The first query we put is as follows: What has been the general effect of the two seasons now passing on the fruit trees, so far as can be seen now; and did the drought of last year check growth appreciably? "The effect of the drought of 1887," replies Mr. Bunyard, "was to ripen up the wood unusually well, and the result is seen in many Apples bearing crops on maiden trees. Apples grew late also, and felt the drought less; but Pears and Plums felt it much more, the growth being considerably less than usual. With respect to the effects of the passing season the great moisture has induced wonderfully fine growth, but because of the hard ripened nature of the maiden wood, or that of last year, the growth of this season is firmer than might have been anticipated. Cold nights and drier weather now are also checking it, and I anticipate that by leaf-fall it will be very firm and ripe." The next query is: At what particular period of the year do you most favour the transplanting of trees to orchards and gardens? "November is naturally the best month for the purpose, but if the winter be fairly open transplanting may go on with perfect safety up till March, provided the land has been duly prepared, and it be not too wet. Young trees well set with fruit-buds should, however, always be planted early in the winter, for it is not generally known that even during the winter considerable root-action takes place." Then we ask, Having regard to your wide knowledge of fruits, not only in your own nurseries, but also over a large portion of Kent, can you suggest any newer or less known varieties of Apples, Pears, and Plums, specially for garden culture, and secondly of market orchard culture?

Mr. Bunyard, whose knowledge of fruits seems to be illimitable—for he has the sorts literally at the tip of his tongue—favours us with a good list of Cherries; for is he not in the midst of a grand Cherry district, also of bush fruits, and specially enjoins the planting, both to crop and provide shelter, that wonderful Damson, Farleigh Prolific; whilst the Frogmore Damson is warmly recommended as a fine cropper. Just one other question, and we have done. Have you found any special good qualities amongst the newer sorts of fruits? "Yes," was the reply, "I strongly commend of new dessert Apples Cooling's Beauty of Bath, Lady Sudeley, Wealthy, Tyler's Kernel, Baumann's Brunette, and Howard's Pearmain; and of culinary Apples Bismarck, Graham's Royal Jubilee (very distinct in growth as we saw), Belle Pontoise, Lady Hamilton, Newtown

Wonder, Sandringham, and Schoolmaster. Of Pears good new kinds are Belle Potanges, Beurré Baltet pere, Madame Leroy, and Aspasie Aumont. Of Plums Grand Duke, Monarch, and Late Transparent Gage; whilst of Cherries I think much of Emperor Francis."

And now, being rested, and the train nearly due Mr. Bunyard kindly escorts us by yet another path back to the station, and we take leave of the nursery and its estimable proprietor very much the wiser for our all too short visit.

## URSINIA PULCHRA.

This is a very pretty annual, better known, perhaps, under the name of *Sphenogyne speciosa*. Its dwarf habit (stems 12—18 inches), elegantly cut foliage, and creamy-yellow flower-heads, like those of a single *Chrysanthemum*, which are produced in profusion and in long succession, render it a very desirable plant. It is probably a native of South Africa. Our illustration (fig. 47) was taken by Mr. Weathers from a plant which has formed a conspicuous ornament on the rockery at Kew during the whole summer.

## THE APIARY.

### THE OUTLOOK.

The outlook for the future is not very encouraging except to bee-keepers who have been feeding vigorously. Syrup-feeding ought to end with September. Should October be warm, and the bees deficient in food, they may perhaps have a little syrup given them for the first few days. After syrup-feeding is done, get some American cloth, and cut it into pieces to fit the hive. Then put two or three pieces of felt, or carpet, over this. I am going to take additional precautions this time by cutting a hole in the American cloth, and putting a basin of dry sugar over each stock of bees. This will, no doubt, be of use to them. Once before I mentioned the Sussex plan of putting a few pounds of brandy-balls on the top of the hives before closing up for winter. This plan is doubtless very good, but we prefer the dry sugar. Sometimes I have not used a basin for the sugar, but laid it all over, and pressed it down. This is recommended by Mr. Simmins, of Rottingdean, and all will acknowledge him to be an authority. We prefer the basin for several reasons; first, the dome-shape seems better for the bees, and when the sugar is partly eaten, the warmest part of the hive is that where the sugar is. It is easier to pack the sugar in a basin, and by tapping it you can discover when it is empty by the ringing sound. We omitted to say that the glazed side of the American cloth ought to be downwards.

All these things ought to be done by the first week in October. Keep the entrances still nearly closed, and leave them so till all danger of robbing is at an end; then open them to their full width. This will cause a current of air to circulate about the entrance, and help to keep the hive dry. Bees often die of damp than cold. As a proof that we have not dwelt too much on the feeding, it may be observed that many stocks are already dead; many, indeed, are not even taking the trouble to kill their bees this year, knowing that they have no honey to take, and that they will surely die. It is, however, very foolish too allow bees to die, or to kill them; it is much better policy, not to say more humane, to unite those who have no honey with those that have. This will make strong stocks, which will be ready to swarm early, or else to give the bee-keeper heavy supers. *Bee.*

**VEGETABLE PATHOLOGY.**—A special laboratory has, says the *Revue Horticole*, been established in connection with the National Agronomic Institute of France, for the purpose of investigating the diseases of plants, and of devising means to combat their evil effects. M. Prilleux has been appointed Director of the Institute.

## FORESTRY.

**—PLANTING TREES, &c.**—Where planting operations are in view, great care should be exercised in choosing such trees as are suited to the soil and situation, and as profitable trees to plant on light, poor, hilly land; nothing excels the Larch or Corsican Pine amongst Firs, and for deciduous species the Sycamore, Birch and Beech, and a host of others. Should the situation be much exposed to the wind, a belt should be planted of the Austrian and Scotch Pine, *Pinus Pinaster*, Sycamore, Crab, common Poplar, *Ulmus alata*, and any of the Maples. The thinner and poorer the land the better does the Corsican Pine seem to thrive; and where the Larch has died out prematurely on gravelly soils by becoming "pumped," there the accommodating Corsican produces a greater quantity of timber in a given time than it would on the best and richest of loam.

When planted on hilly declivities the Larch does best, and is free from disease, particularly if the aspect be west or north-west. For marshy ground the Alder and Willow, as well as several kinds of Poplar, succeed admirably, and soon impart a clothed appearance to the landscape.

On limestone and chalky soils, *Abies cephalonica* and *A. Pinsapo*, the common Yew, *Wellingtonia*, Austrian and Weymouth Pines, *Pinus austriaca*, and *P. Strobus*, make good timber and close shelter. Then for hardwoods we have the Beech, Spanish Chestnut, Sycamore, Maple, and Elm, amongst timber trees; and the *Pyrus*, Dogwood, Elder, *Viburnum Opulus* and *V. lantana*, amongst smaller growing or underwood shrubby species.

Where the soil is of a deep rich loamy nature, and resting on clay or gravel, the Oak and Ash may be planted, and with every chance of their succeeding well, and yielding a large quantity of timber. Amongst copses, and in thin soils and undulating grounds, the Sweet Chestnut, Hazel, and Ash may form the main crop, the latter occupying the deeper and better soils, where it will ultimately attain to fair proportions, and become a valuable market commodity.

**Planting on Peat Soil.**—On peaty soils few, indeed, are the trees that refuse to grow and give a very satisfactory return for expenses incurred. Rank peat bog must, however, have the water drained off by ditching before planting is begun, or the results will not be very satisfactory. The Scotch Fir, when planted in quantity, acts as a powerful absorber of moisture, and for this purpose it has been largely used in the province of Ulster for bog planting. I know well of several woods not very far distant from the shores of Lough Neagh planted fully twenty years ago on unreclaimed peat bog, and that are now doing splendidly. The tract of bog at the time of being laid down to woodland was simply divested of all heather by burning, and afterwards wide and deep drains were cut, but only along the margin and through the dampest portions of the ground. Scotch Fir formed the main portion of the crop, and these were planted in pits that had been dug out three months previous to planting. For some years after planting, the ditches were half-full of water, but as the Firs grew in size the amount discharged became less and less until the drains were, practically speaking, useless for the purpose intended, and are now as dry as any other portion of the woodland. That the Scotch Fir acts as an absorber of moisture—more so than perhaps any other tree—is fully verified by a remarkable experiment conducted on the Continent some years ago.

**Seaside Trees.**—For planting along the sea coast we have an excellent collection of trees and shrubs, including such tried subjects as the Cluster Pine (*Pinus Pinaster*), the Austrian (*P. austriaca*), the Aleppo and Corsican (*P. halepensis* and *P. Laricio*), *Cupressus macrocarpa*, *Thuja gigantea*, the common Yew, Scotch Fir, and many others among the coniferous section. Then amongst hardwoods the Willow, Elm, Sycamore, Alder, Poplar, and Elder rank high, the latter thriving with luxuriance down to the very beach. Amongst shrubs the *Laurustinus*, Box, Thorn, Tea tree (*Lycium barbarum*) *Escallonia*, *Pyrus* of many kinds; *Eucalyptus*, various species; *Tamarisk*, and *Privet* are only a few of the many that may be planted with the certainty of their doing well. As town trees, *Platanus orientalis*, *acerifolia*, Sycamores (particularly the variegated kinds), the Lime, *Ailantus*, Thorns, Sumach, Aucuba, *Privet*, *Lilacs*, *Prunacantha*, and *Eucalyptus* are all good subjects.

**Form of Woods.**—Before passing from the subject

we will briefly consider what is, strictly, landscape planting, as well as a few of the coniferous and other trees that have been found best suited for the ornamentation of our parks and grounds. In forming new plantations, clumps, or masses of

out of the square or rounded fashion that, unfortunately, one so often sees in a day's walk over almost any part of the country.

A wood, particularly that in which deciduous trees form the main crop, may be enlivened by the plant-

FIG. 47.—*URSINIA PULCHRA*, ANNUAL (SEE P. 355).

trees, an eye to the beautiful should always be considered a matter of paramount importance, and more particularly so as no extra expense, practically speaking, is required to render a woodland picturesque, more than would be occasioned to plan it

ing of choice Conifers and deciduous trees with fine foliage and noble port around the margins.

Mass planting is here, perhaps, the best mode to pursue, and many of our hardiest Pines and Cypresses are the trees best suited for such a work. The

Austrian Pine is excellent for the purpose. Moreover, it succeeds anywhere, is readily transplanted, and is of very rapid growth. At a convenient distance from the Austrian we may well introduce a clump of the Weymouth Pine, the contrast of the foliage of these two species being pleasing and distinct; but do not make the clumps of equal size nor of the same outline, else formality and sameness will characterise the work.

Lawn's Cypress and Juniperus virginiana make good group or margin trees, and if a bit of greenery is wanted in our deciduous winter landscape we have only to introduce throughout the woodland generally a few masses of such shade-loving subjects as the Yew, Holly, and evergreen Oak. The many varieties of American Oaks and Maples are beautiful in the autumn when their foliage is maturing, and most of them are trees of massive proportions.

**Garden Planting.**—In conclusion, one word about how to plant will at least be of use to the amateur. The first step towards success in tree and shrub planting is thorough preparation of the ground; the second, a right choice of trees for particular situations; and the third, using good, well-rooted plants, and planting in a right and common-sense way. Where a tree is to be planted, dig out a pit larger than the spread of the roots by nearly a couple of feet; well loosen up the sides and bottom with a pick, and substitute fresh and suitable soil for that dug out, if such be found necessary. Now this may seem somewhat expensive, but for valuable trees, such as specimen Conifers, &c., it is well expended, the results obtained compensating in a tenfold degree for the labour and cost of proper planting. Leaf-mould, if thoroughly decomposed, is a valuable addition to any soil, and may be employed to the extent of one quarter of the whole bulk of new or old soil put about the roots of trees and shrubs of all kinds. Do not plant too deeply, and spread out the roots as much as possible. *A. D. Webster, Holwood Park, Kent.*

## PLANTS AND THEIR CULTURE.

**SHADING.**—This should now be reduced to the least quantity, and, where the blinds are movable, there will be no difficulty in doing this; and except in the case of very soft-leaved plants growing in a high temperature, it should not be wanted any longer. Still, if it be left on the houses for a little while longer, it could be let down for a short time in the middle of the day if found necessary to do so. Fixed shading on the glass must now be washed off, as all plants, especially tropical plants, will require all the light possible to mature their growth; and it should not be forgotten that to secure well-ripened growth on these latter plants, a high temperature must be kept up. Sometimes when we arrest growth by lowering the temperature we are apt to believe that that is equal to natural ripening of the wood, but there is much difference between this and proper maturation. What we want is to consolidate growth, which can only be done under the influence of light, and a suitable temperature. This ripening process is assisted when a drier atmosphere is maintained in the house; a moderate amount of air being given when the nature of the plants admits of it, but taking care not to subject Marantas, some soft-leaved Anthuriums, Dieffenbachias, or Cyanophyllums, to it; at least, considerable discretion should be used, otherwise the leaves are apt to take on a singed appearance at the edges; but hard-wooded subjects, whether of the flowering or foliage sections, withstand the vicissitudes of winter much better, if matured in plenty of heat, light, and air. Thin out all weak and superfluous shoots in the case of evergreen species if now out of flower; deciduous ones may be stowed in the drier parts of the house or removed. But whatever means are employed, the object should be to secure well-ripened growth that will produce strong shoots and plenty of flowers and foliage, as the case may be, in the spring. With greenhouse subjects, it is practically the same, but in their case there is a well-marked difference between the summer and winter temperature common to the temperature zones.

**Housing of Plants.**—Although we have been enjoying almost summer weather recently, yet the nights are getting long, when frost may occur at any time. Therefore all plants at present outside and which are likely to be injured by it, should be housed or otherwise protected forthwith; but if space is not at

liberty some of the harder things might, with some kind of protection, be left outside a little longer. The ordinary now disused greenhouse shading will be, in the case of many plants, sufficient covering to ward off slight frost from Camellias, Indian and other Azaleas, Cytisus, many species of Acacias and Rhododendrons, of course taking care to protect the roots from excessive moisture, or cold winds, else they are apt to decay. Indeed, protection to the roots is quite as important as for the foliage, for if the roots are comfortable they will withstand a great degree of cold; and such things as Indian Azaleas and Camellias, if their roots are in proper condition, are all but hardy in this country. We have seen them growing in the open borders in the neighbourhood of Glasgow, and also in Sussex, where they frequently flower well. If those who have Azaleas infested with red spider or thrips would let them get a few degrees of frost, it would much assist to clean them. However, all tender Cape and Australian plants should be housed as early as possible, at the same time giving them a thorough cleansing, both pots and plants, as well as the house which is to receive them; and in staging them while keeping an eye to effect, try to allot to each a suitable position, keeping the weakly growers well up to the light, even if it does slightly mar the general effect. In all cases give plenty of air after housing, as if kept close they would probably make fresh growth, which is not desirable for some time yet, that is, speaking generally. *F. Ross, Bletchingley.*

## FRUITS UNDER GLASS.

**MELONS.**—Great care must be taken in watering Melons and especially when they are on the verge of colouring, or splitting will occur. To obviate the necessity of watering place a good mulch of spent hotbed or Mushroom-bed manure over the roots. In order to impart good flavour to Melons at this part of the year a strong dry warmth must be kept up. When they are colouring take advantage of every glint of sunshine to ventilate freely. Plants swelling their fruit must suffer no check and the syringe must be dispensed with, guarding especially against moisture lodging on the stems, or canker may soon put in an appearance. Let the night temperature be kept as near 75° at 10 p.m. as possible.

**Cucumbers.**—Plants raised from seed about the middle of the last month will now be considerably advanced in growth and will need a medium amount of moisture in the atmosphere and to be ventilated at all suitable times so that a stocky growth may result. Pinch the shoots freely and pick off the male blossoms and all shows of fruit until it is really necessary to let the plants fruit, and crop afterwards with moderation. When the roots appear on the surface afford a dressing of light rich compost of the depth of 1½ inch—the plants being kept in a healthy state by this means than by being allowed to run deeply into a bed of heavy loam. A warmth of 70° to 75° will be high enough at 10 p.m. A successional sowing may be made at once, but unless the autumn should be very favourable it will not be of much value.

Old plants of Cucumbers must be watered twice a week with some weak manure-water, and all the old injured leaves cut off, but do not do this too closely, rather nip off the leaves, leaving the footstalks. Induce as much young growth as possible before the dull weather sets in, and if the plants should be infested with spider, thrips, or greenfly, fumigate with tobacco or syringe with weak petroleum—one or two applications will be found effectual. When petroleum is used on the rough surface of a leaf of a Cucumber or a Melon it is well to syringe with clean water an hour afterwards, the inequalities of the leaf making it likely that some of the petroleum may be retained on to the injury of the leaf. Cucumber plants in frames must have the dung linings freshened up with new materials, and mats employed to procure the necessary temperature. Strawberries will now have well filled their pots with roots if all has gone well, and where these have been grown on ground trellises they will have had the advantage this season; the soil in the pots being considerably warmer than that in the pots standing on the bare ground, where, with the best possible drainage, they were at times completely waterlogged. Pinch off all the runners as they appear, and give weak manure-water at every other watering. *W. M. Baillie, Luton Hoo.*

## THE KITCHEN GARDEN.

**OUTDOOR MUSHROOM BEDS.**—This is the best time for making these beds; they should be put up in dry weather in a position sheltered from the east and north-east winds, and they will do very well if placed among standard Apples trees, or similar place, provided the trees do not immediately overhang the beds, the drip from them being detrimental to Mushroom growing. The materials should be prepared in the same way as advised for beds indoors, with this exception, that as these outside beds contain a greater bulk of manure, more care must be taken to prevent overheating when made, and if this occurs failure is certain, the ammonia which should support the growth of the Mushrooms getting dissipated before the bed can be spawned, the bed gets dry in the middle, and it is soon too cold. The manure being ready take out a trench 4 feet wide, and one spit deep; shovel the soil from the bottom, and make level. Place the soil 3 or 4 feet back from the edge of the trench; the bed when completed should be cone-shaped, 4 feet wide at the base, and 4 feet high, and should be put up in sections of not more than 10 feet at a time, spreading a layer of the manure along the whole length of the trench to this distance, and laying it down as firm as possible, then another layer on top of that, treading it well down as the work proceeds, and drawing in the sides to the required slope; in order to get this right it is best to place a stake at each corner, and one at each end of the bed, to show the height of the ridge. When the bed is of the required size the sides should be dressed off smoothly with a fork, and the whole left firm and solid. If showery weather ensue it will be necessary to protect the bed with tarpaulins or Eddy's dressed canvas (I have found the latter most useful for the purpose), at the same time give as much ventilation as possible in order to prevent overheating. As soon as the heat of the bed declines to 85° the bed should be spawned, inserting pieces about the size of a hen's egg just under the surface, at six inches apart, making all firm again with a spade (new spawn should always be used in preference to that which has got very hard and dry), soil should then be placed over the surface of the beds to the thickness of 2½ inch when beaten down. In many instances the soil taken out of the trench will do for this purpose, if freed from the largest stones and broken down well with the spade. The bed should then have a slight covering of the long litter that was shaken out when preparing the manure, in order to keep the surface from getting dry, and should also be protected from rain as before advised. When there is no more danger of its getting too hot it should be at once covered over with Barley straw, drawn straight and placed carefully so as to exclude the winter rains; this covering should vary in thickness according to the weather, from 6 to 9 inches being necessary at times, and during very sharp frost and heavy falls of snow the tarpaulins may be put on over the straw, the object being to preserve the heat of the beds as long as possible and not to let the temperature in the soil of the bed rise much above 60°. Early in December the beds should be examined to see if any Mushrooms are ready and to place a little fresh litter on the surface, always choosing a mild sunny day for this purpose, and covering up the bed again as quickly as possible to prevent the lowering of its warmth. This operation will need to be repeated occasionally whenever the litter on the surface of the bed has become wet and decayed. In April and May the beds may require to be watered with lukewarm water, but only part of the straw covering should be removed for this purpose. This will be all the attention the beds will require, and these formed in this manner will yield Mushrooms from December to the end of May if duly attended to, unless the weather be very severe; the produce is larger and of better flavour than that grown in Mushroom-houses, but is not so nice in appearance. *W. H. Divers, Ketton Hall, Stamford.*

**INDIAN FIGS.**—Dr. King, the Superintendent of the Royal Botanic Garden, Calcutta, has just published the second part of his illustrated monograph of the species of Ficus found in India, Malaya, and China. This work forms the first volume of the *Annals of the Botanic Garden, Calcutta*. The species, 206 in number, are very fully described, with their synonyms, so that the monograph is of a very exhaustive character, and one greatly redounding to the credit of the author for patient examination and discriminating judgment.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

**GARDENERS' CHRONICLE OFFICE TELEGRAMS.**  
NOTICE to Correspondents, Advertisers, Subscribers and others. The Registered Address for Foreign and Inland Telegrams is

## APPOINTMENTS FOR THE ENSUING WEEK.

### SALES.

MONDAY,	OCT. 1	Dutch Bulbs, at Stevens' Rooms.
		Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	OCT. 3	Greenhouse Plants and Stock, at the Kingston Nurseries, Kingston (three days) by Protheroe & Morris.
		Dutch Bulbs, at 123, Fenchurch Street, by Messrs. Small & Co.
THURSDAY,	OCT. 4	Dutch Bulbs, at Stevens' Rooms.
		Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	OCT. 5	Imported and Established Orchids, at Protheroe & Morris' Rooms.
		Dutch Bulbs, at 123, Fenchurch Street, by Messrs. Small & Co.
SATURDAY,	OCT. 6	Dutch Bulbs, at Stevens' Rooms.
		Dutch Bulbs, at Protheroe & Morris' Rooms.

Transit of Fruit.  
OUR American cousins, as many of us know, are great fruit growers and great fruit eaters. Nothing surprises them more when they visit the old country than the relative paucity of fruit on our tables and the high price in the shops. We read occasionally of Strawberry trains running distances and carrying weights of fruit which to our limited and circumscribed notions seem prodigious.

At the recent Fruit Conferences the subjects of fruit-transit and of fruit-conservation have naturally not been lost sight of. In some cases we have heard of fruit being sent from Sittingbourne to London by barge in order to avoid the high charges of the railway company. But it is obvious that, however suitable this mode of transit may be for hard fruits such as Apples, or even Plums, it is not adapted for soft fruit like Strawberries and Raspberries, for which some quicker mode of conveyance must be adopted unless—in deed, the barges could be fitted with refrigerating chambers. Steam barges, or even steam-tugs might be employed to abridge the period of transit. On these points, however, we deemed it desirable to know what was done by our Transatlantic friends, and with this view we applied to the Editor of the youngest, but by no means the least influential, of horticultural journals—*Garden and Forest*, with the following results, which will be read with interest at the present time:—

"Strawberries," says Professor SARGENT, "are brought to market in special fast freight trains, but generally in ordinary cars, when the run is not less than fifteen hours, the trip usually being made at night. When the fruit is packed on Saturday night, and not delivered until Monday morning, especially in New Jersey, the ordinary refrigerator cars, such as are used to bring dressed beef from Chicago to the seaboard, are used, the ice being put sometimes in the ends of the car, and sometimes on the top.

"Peaches are brought from Delaware and Southern New Jersey at this season of the year to New York

and Boston in special trains, generally run at night, in ordinary cars, when they are sent longer distances, say from New York to Chicago.

"When the Michigan Peach 'crop falls short, as is often the case, then the fruit is packed in refrigerator cars. Eighteen hours is probably the maximum distance it pays to ship without ice, and, of course, a good deal of fruit is lost even at this distance. But fruit is so cheap in this country that dealers cannot afford to spend much in getting it to market. Refrigerator cars have been in use in this country for years, and all English railway experts must know all about them."

SOME years ago our excellent colleague, the late THOMAS MOORE, published in these columns an excellent Monograph of Garden Hollies (see *Gardeners' Chronicle* for 1874, 1875, and 1876). His trained eye and long practice in the determination and classification of the endless varieties of Ferns, in which the distinctions are more minute than in Hollies, served him in good stead, so that, by the aid of his terse, but accurate, descriptions aided by numerous figures, it is, in general, not a very difficult, though it may prove a long task, to name a Holly. The variations are exceedingly interesting, not only on account of their numbers and their ornamental character, but because they illustrate the extent to which one species may vary unaffected by hybridisation and the direct action of external conditions. The common Ivy and the Chinese Primrose furnish other illustrations of a capacity to vary, for, in many cases, no better reason than we can assign than "because it is their nature to." In some instances external conditions may have some effect, but when we see a score or a hundred varieties all produced under like circumstances, perhaps all seedlings from one tree, and growing together under like conditions, it becomes hard to see that the circumstances can have much to do with the variability. In some cases the variations represent the form peculiar or proper to certain stages of growth, as, for instance, in the Ivy, where, as Mr. SHIRLEY HIBBERD pointed out, the forms peculiar to the flowering or adult period are often quite distinct from those assumed during the "wild oat" period of bachelor growth among Ivies. In the Holly the variation is first of all into forms with purple or with green shoots. As to the leaves, they vary greatly in size, in colour, in flatness, in the amount and disposition of the spines, in the twisted or hooded character, and in various other matters to which it is not necessary now to allude in detail. Are they not all set forth in the monograph to which we have referred? Turning to the flowers, we must remind the reader that the Holly is, botanically speaking, polygamous. Some of the flowers are male, bearing stamens only; some female, bearing pistils only; some hermaphrodite, with both stamens and pistils, but when both are present in the same flower it by no means follows that the pollen exerts any influence on the pistil with which it happens to be associated in the same flower, and *vice versa*. It may, and does happen, that a particular tree bears male flowers constantly, and then no berries are to be expected on that tree. Another tree may bear all female flowers, and its pistils may ripen into fruit by the agency of the pollen-bearing flowers on neighbouring trees. These characteristics are tolerably constant, but sometimes vagaries occur, and a plant that heretofore has borne stamens only becomes covered with berries, or a plant that is usually covered with berries fails to produce any. These variations in the sexual characteristics, though common enough, always excite astonishment, some-

times even from the growers of Mulberries, Cucumbers, and Marrows, who might be expected to be familiar with such variations.

Mr. CROUCHER, of the Gardens, Ochtertyre, lately favoured us with a series of splendid specimens representative of the varieties of Holly under his charge, and which represented a large number of the forms described by Mr. MOORE. But the point of special interest was the indication given by Mr. CROUCHER of those forms that do and those that do not, or have not, produced berries. We subjoin Mr. CROUCHER's list, merely stating that care must be taken not to assume that the Hollies in the fourth column were all exclusively male plants. The non-production of berries may, in some cases at least, have been due to other than structural causes. The numbers are those of Mr. MOORE's monograph.

**ROUPELLIA GRATA.**—This rare stove climber (fig. 48) has lately flowered in the Palm-house at Kew, where it is trained up against the glass on a wire trellis. It may not be out of place to record a description of it here, on account of the beauty and fragrance of its flowers, and its free habit. It has a woody, terete, and shining stem, sparsely covered with small warts. The leaves are opposite, entire, shortly petiolate, 5 or 6 inches long, oblong-elliptic acuminate in shape, and of a dark shining green colour on the upper surface. The inflorescence is borne on the ends of the branches in clusters of six to eight shortly pedicellate flowers, which scent the atmosphere for some distance around with their agreeable odour. The calyx is fleshy, and of a shining crimson colour, while the tubular corolla is  $\frac{2}{3}$  inches or more in diameter, and consists of five broadly obovate recurved petals of a creamy-white, tinged with rose from the margin inwards. The throat of the corolla is surrounded by ten lanceolate-linear ligules, the corona of a brownish-red colour. After a couple of days the flowers become very much crinkled, and do not then present such a handsome appearance as when freshly expanded. This plant, which is supposed to yield what is known as the "Cream Fruit," is a native of Sierra Leone, whence it was introduced to cultivation some forty or fifty years ago—it is believed by a Mr. WHITFIELD—and was exhibited at the Devon and Exeter Horticultural Society's spring exhibition, where it obtained a prize under the name of *Strophanthus Stanleyanus*. It was afterwards named in honour of the Roupell family, but especially Charles Roupell, Esq., on account of the encouragement they gave to botany.

**THE NATIONAL CONFERENCE ON APPLES AND PEARS AT CHISWICK, OCTOBER 16 TO 20.**—We would remind intending exhibitors and others interested in the cultivation of Apples and Pears, that the date of this important meeting is only three weeks' distant. The late fine weather has so materially improved the fruit crops, that we may confidently look forward to a display of more than ordinary merit. Arrangements are being made for the Conference, which promises to be of a thoroughly practical character. Any one intending to take part in the same should at once communicate with Mr. BARON at Chiswick.

**THE LINNEAN SOCIETY.**—MR. DAYTON JACKSON has earned the cordial thanks, not only of all Fellows of the Society, but of all botanists, for his Index to the first twenty volumes of the *Journal* (Botany) of the Society, published between 1857 and 1884 inclusive,

and incorporated with which is an Index to the *Proceedings* from 1838 to June, 1886. The Index occupies no fewer than 427 pages, double column, and comprises a double record (though in one alphabetical sequence) of the names of authors and of the titles of their papers. Every species described or commented on is separately indexed. In some cases an improvement might be suggested; for instance, we find three entries under the word "adventitious," relating to Grape, Berberis, and Brassica respectively. We do not think anyone would think of looking under the word *adventitious* for these objects, while if he looked under Brassica he would not find what he required. The entry "Colletia, with combined characters," is probably not one which the author himself would have used, but the compiler may have found it as it stands in the *Proceedings*, a circumstance which shows the advisability of submitting the short records in the *Proceedings*, to the Fellows concerned, as well as their longer papers. Far be it from us, however, to be, even in appearance, captious. We are much too sensible of the magnitude of the service rendered at the cost of so much disinterested self-devotion by Mr. JACKSON to feel aght but grateful to him, and we know that each week will intensify the feeling. Fellows may procure their copies on application at the Society's rooms.

**AGRICULTURAL LECTURES.**—The annual course of lectures on agriculture will be given at the City of London College, Moorfields, on Tuesday evenings, at 7 P.M., beginning on October 2, by Mr. BERNARD DYER, B.Sc., F.C.S., F.L.S., Consulting Chemist to the Essex, Leicester, and Devon Agricultural Societies. The lectures will treat of soils, plant life, manures, tillage operations, live stock, dairying, food, &c. The course will be in connection with the Government Science and Art Department, and will end in May. In addition to the City of London College and other prizes, the Saddlers' Guild offers, as in former years, a prize of £5 5s. to the student who passes the best examination in chemistry and agriculture.

**AMARYLLIS RETICULATA.**—It is seldom that cultivators succeed with this Brazilian plant so well as they may wish, and the reason may be found in the fact of a positive rest period not being afforded the plants after having bloomed. On the occasion of a recent visit paid to the garden of H. E. GREEN, Esq., of Kingsford House, Colchester, we saw several plants in fine bloom, two of which had as many as twenty spikes of beautiful pink transversely veined flowers. Mr. KITTLE, the gardener there, described the simple means he employed to obtain such good results, and these were infrequent re-potting—perhaps once in two or three years—top-dressing annually with rich sandy loam being sufficient in the intermediate years; growing the plants in an intermediate-house from the month of March till they flower in August and September, and then a rest in an ordinary greenhouse from November till March, water being quite withheld during that season. The leaves remain on the plants all the winter, and although they may shrivel somewhat from the enforced drought, they become again plump on water being afforded the plants.

**THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.**—The annual dinner of this Society is announced for October 11 at the Cannon Street Hotel, E.C.4. Dr. Hogg, F.L.S., in the chair; and Mr. H. J. VERRILL in the vice-chair. At a meeting of the committee held at the "Caledonian" Hotel, Adelphi, on Monday last, special sub-committees were appointed to deal with the decoration of the hall and tables, the arrangement of the dessert, &c. It was reported that Messrs. B. S. Williams, J. Laing & Co., and H. Cannell & Sons, had promised to send plants for the purpose without charge. Messrs. W. Thomson & Sons, Clowforders, had also promised a basket of Grapes. Mr. E. R. CUTLER offered, on behalf of Miss Maria Belval, to provide a musical entertainment at a merely nominal cost, and this offer was gratefully accepted. The committee

of this useful Society make an appeal for support on this interesting occasion. The dinner will take place at 5.30 P.M.

**THE YORK GALA.**—MR. CHARLES SIMMONDS has succeeded Mr. WILSON as Secretary to this Society. Mr. WILSON leaves shortly for London, and the committee has voted him a handsome presentation as some recognition of his valuable services, and some of his old friends, exhibitors and others, contemplate a further presentation.

**THE BOTANICAL GARDEN AT BADEN-BADEN.**—MR. PAUL SENTINIS, who, on the inducement of Mr. MAX LEICHTLIN, had undertaken a botanical exploring tour to Kurdistan and East Armenia, has now safely returned to Europe, carrying with him large and very rich herbaria, and also several thousand roots of new bulbous plants to be cultivated at, and hereafter to be distributed from, Mr. MAX LEICHTLIN's private botanical garden.

**"THE ORCHIDENNE."**—Under this name was constituted at Brussels, on September 23, a Society of Amateur Orchid Growers. The object of the Society is exclusively to foster the taste for, and promote the culture of, Orchids. This object is to be effected by meetings or monthly exhibitions, frequent lectures, and annual exhibitions. The Society consists of seventy foundation members, but there is no limitation as to the number of members in the future. The Honorary Presidents are Baron de Bleichroder, H.B.M., Consul at Berlin, for Germany; J. Linden, for Belgium; Count du Byssong, for France; De Lansberge, ex-Governor-General of the Dutch Indies, for Holland. Four other Honorary-Presidents for other countries will be appointed at the next general meeting. The Executive Committee is composed of three members appointed for four years. The gentlemen elected by the unanimous vote of fifty-three members present or represented, are the following:—Chairman: G. Warocqué, Member of the "Chambre des Représentants;" Secretary: Lucien Linden, Editor of the *Lindénia*; Treasurer: J. du Trien de Terdonck. The members of the jury for the monthly meetings are:—MM. F. Kegeles, D. Massange de Louvrex, J. Van Volxem, E. Rodigas, G. Miteau, L. Lubbers, J. Moens, A. Van Inschoot, E. Wallaert, A. Lallemand, O. de Meulenroere, Count A. de Bousies. The first monthly meeting will be held on October 14 next, in the great Exhibition Hall of the "Horticulture Internationale," Rue Wiertz, Brussels. Among the seventy foundation members are MM. E. Bergman, Secretary of the National Horticultural Society of France; J. E. de Puydt of Mons; Max Kolb, Munich; Maxime Cornu, Director of the Jardin des Plantes, Paris; Beaucarne, A. de Warelles, Chevalier L. Modigliani, Dr. F. Müller, of Graz; De la Devansaye, Count de Villeneuve, Brazilian Minister in Brussels; Prince Meteschsky, Baron de Bethune, H. Gruson, Magdeburg; De Franciosi, F. de Cannart d'Hamale, &c. The Society will organise a great exhibition of Orchids in the spring of next year.

**A LILY SHOW.**—"Nothing to be seen in London in September!" Gardeners know better than that, while plant-lovers will know that a visit to a nursery at any season is sure to be of one interest. But recognising all this as well as most people, we own we were not prepared for so fine a show as that Mr. W. BULL has prepared in succession to his Orchid exhibition. His display of Lilies occupies the same long house as that devoted to the Orchids, and we do not exaggerate when we say that the general effect is little, if at all, inferior. Of course we do not expect orchidomanics to coincide in this opinion, but those who are not specialists will admit, that for delicacy, if not variety of colouring, the Lilies equal the Orchids; while as to perfume the latter—to use a cant phrase—are "not in it." The display is made up chiefly of innumerable varieties of *Lilium auratum* and *L. speciosum* together with *L. tigrinum* and others. Of *L. auratum*, the finest examples belong to the type *platyphyllum*,

distinguished by its broader leaves, larger, and more substantial flowers. The colour variations of each section run parallel; thus in both the common and in the platyphyllum types there are red-striped forms, golden-banded forms, warted forms, and forms with smooth segments. It thus becomes necessary to recognise two forms of virginalis—one belonging to the ordinary type; and in which the segments are warted, and one to the platyphyllum type, in which the segments are destitute of warts and spots. *L. auratum rubrovittatum* is a favourite by reason of its deep crimson band. In the speciosum type there is every variety, from the clearest white of the form known as *Kraetzeri* to the rich carmine segments of *Melpomene*, and the form of the flower and the direction of its constituent segments are also subject to as great diversities. Of *L. tigrinum*, mention must be made of *L. tigrinum jucundum*, with linear leaves and red-spotted flowers; and *L. tigrinum Leopoldi*, with ovate-lanceolate leaves and broader segments to the flowers. The display will be kept up for some time longer, as many of the speciosum type, especially *Kraetzeri*, have not yet unfolded their blooms. It was curious to see the profusion of bloom that had been formed on *L. candidum*, the common white Lily, perhaps the loveliest of all; and which under some circumstances fails to flower. Here in this nursery a large number were lifted for sale, and those that were not disposed of were simply laid in. These have flowered in profusion—an argument, some will say, for shallow planting, but what the effect on the bulb may be we cannot say. Of course, no one would visit this establishment without at least a glance at the Orchids. It is not a season when much bloom may be expected, but some of the *Odontoglossums*, such as *O. Harryanum*, the white-lipped form of *Bictonense*; *Miltonias*, *Masdevallias*, may still be found in bloom, while among *Lælias*, *Turneri*, *Dayanana*, *bicolor*, *Harrisoni*, and others, are in flower, and there is a rich promise of future bloom from the remarkably sturdy and healthy inhabitants of the large *Lælia* house.

**CUCUMBER BIBBY'S SEEDLING.**—This is an excellent summer Cucumber, a great bearer, and handsome, in many points resembling Rollinson's Telegraph, when true to name. It was, we believe, raised by Mr. BIBBY, nurseryman, Colchester, and is much in repute in the Eastern Counties.

**THE ENGLISH APPLE AND FRUIT GROWING COMPANY, LIMITED.**—Under this title a company is to be formed, with Messrs. HERALD, A. F. BARRON, J. CHEAL, and J. ROBERTS as directors, and Mr. R. DEAN as temporary Secretary. The company proposes to purchase a suitable farm of 300 acres, in Kent, and there carry on the cultivation and preservation of hardy fruits. A capital of £50,000 is required to be raised in shares of the value of £1 each. Mr. OLLARD, of 1, Clifford's Inn, Fleet Street, is the solicitor, and the bankers are the London and County Banking Company.

**THE BRITISH ASSOCIATION.**—At one of the recent meetings at Bath, the Rev. R. BARRON read a paper on the flora of Madagascar, basing his statements on his own research and the investigations of Mr. Baker. He referred to the ruthless manner in which the forests are being destroyed by the natives. Representatives of 143 orders and 980 genera have been found; three regions—eastern, central, and western—are recognised, only comparatively few forms being common to all three. The Composite and Leguminous plants and the Ferns are the best represented. One Violet has been found also at a great elevation. Fernando Po, the Cameroons, and Abyssinia, and some other instances of equally curious distribution, point to an earlier temperate period. Four-fifths of the species and one-seventh of the genera are peculiar to the island, thus indicating its great antiquity—a fact to which its zoology also bears witness.

**The Weather.**—Mr. E. J. Lowe stated, at the British Association, that the effect of the weather of 1888 had been to destroy large numbers of birds,

to such an extent that it had been unnecessary to protect the fruit. Slugs and snails had been extremely abundant. All seedling plants, vegetables, leaves, and flowers, had been destroyed wholesale, and great damage had been done to Wheat, grass, and other agricultural crops; but what had been most noticeable was the destruction by caterpillars of all the leaves of the Oak. Thousands of Oaks had been without leaf, bare like winter, and now they were only just coming into leaf again, but unfortunately a second crop of caterpillars was noticed recently resuming the attack on the new leaves. There had been a great increase among the destructive slugs of various kinds, and earwigs, woodlice, ants, butterflies, and beetles, had also been unusually abundant, but there had been an absence of wasps, and only a very few moles. Snakes and adders had been very numerous. Early sown Peas were twenty-one weeks before they were fit for the table, and all fruit had been very late, many Gooseberries being not yet ripe, and Currants still abundant. Pears were scarcely swelling, and of Mushrooms there were none. There was an enormous crop of Oats. The hay crop had been the latest ever known, much remaining unharvested at the beginning of the month. It was worthy of remark that many delicate plants were uninjured by the cold of last winter. The author explained, in concluding,

FIG. 49.—BLACK CANCER OF BULBS.

that his reason for contributing the paper was in order that it might be a record for future comparison.

**PINE RIPENING IN THE OPEN AIR.**—We desire to call attention to an interesting experiment recorded in another column, by that veteran and venerated horticulturist, Colonel TREVOR CLARKE. We need only add here, that the Pine was a well-formed one, 14 ounces in weight, very juicy, and fuller of flavour than many a hothouse Pine that we have tasted.

**PRESERVING POTATO BAGS.**—Mr. J. A. Hogg, in the *English Mechanic*, says:—"Steep the sacks for twenty-four hours in a decoction of 1 lb. of Oak bark in 14 lb. of boiling water. Then pass it through running water and hang up to dry. This quantity does for 8 yards of material."

## BLACK CANCER OF BULBS.

OUR friends on the Continent recognise a certain disease of bulbs under the name of "black cancer" or "black rot." In typical cases the bulbs are studded with minute black projecting spots, as shown in the upper part of our illustration (fig. 49); this is the resting or hibernating state of the fungus which causes the disease. Bulbs of *Narcissus* are imported into this country in an apparently sound condition, but really with the fine threads of a fungus mycelium just beneath the outer membrane; in this condition it is impossible to tell without a microscopic examina-

tion whether the bulbs are free from taint or not. In the course of a few weeks (or perhaps months) the spawn or mycelium beneath the membrane becomes condensed, and congregates in little knots (like grains of gunpowder), which speedily become black outside. These grains are sclerotia or little nodules of hard fungus spawn. If the membrane of the bulb is carefully laid open with a needle, and one of the black grains exposed, it will be seen, if enlarged ten diameters, as shown on the left of the illustration. If a fragment of the sclerotium is examined under the microscope and enlarged 500 diameters, it will be seen, as in the right-hand bottom corner, one compact mass of very fine fungus threads. If reference is made to the *Gardeners' Chronicle* for May 28 last year, p. 712, an illustration will be seen of the threads of the well-known sclerotium of *Anemone* beads, enlarged 150 diameters; this latter sclerotium has threads four times the diameter of the sclerotium of *Narcissus* and *Hyacinth* bulbs.

The black grains, or sclerotia, remain perfectly quiescent whilst the bulb is quiescent, but as soon as the bulb shows signs of renewed life the black grains become active. When the bulb is planted the grains also are obviously planted at the same time: the warmth and moisture favourable to the bulb is exactly what the grains require. The grains, after about nine months' rest, produce a small fungus named *Peziza*—possibly *P. ciborioides*, Fr.—a fungus which sometimes grows on Oak leaves and on Clover; in the latter position it is a cause of one form of (but not the true) Clover sickness. This fungus produces spores which germinate and produce a new crop of sclerotia. The mycelium of a similar, but larger sclerotium, is sometimes very destructive to the Potato haulm: the *Peziza* of this sclerotium (*P. postuma*), has been described and illustrated in the *Gardeners' Chronicle*.

The life of the "black cancer" of bulbs is carried on in a passive state from year to year by the black grains, termed sclerotia, beneath the membrane of the bulb. As bulbs infected with the granules propagate the disease, no bulbs exhibiting the granules of "black cancer" should be sold or planted. A very similar sclerotium grows on Onions; this on germination produces a mould, or mucor. *Worthington G. Smith, Dunstable.*

## NOTICES OF BOOKS.

**THE PRODUCER AND CONSUMER.** By Samuel Rawson. (J. L. Allday, Birmingham.)

This is an essay in pamphlet form purporting to contain "Practical Hints by a Practical Man." From a perusal of its pages we feel convinced that its author is animated by a desire to ameliorate the condition of the peasantry, small farmers and others, who are dependent on land cultivation for a livelihood. The object in view is praiseworthy, and one to which we are willing to subscribe at all times, but whether it will be gained or furthered by the publication under notice, is quite a different matter; we rather incline to the opposite belief. In his introductory remarks the author informs his readers that he has had "upwards of thirty years' experience as a fruiterer and salesman in the fruit and vegetable trades in one of our largest provincial markets;" and further, "for many years I have persistently urged upon farmers and others with whom I have been in contact in the course of journeys made into all parts of England, the absolute necessity, if they wished to make the land pay, for attention to fruit and vegetable growing; and I have brought to their notice, again and again, the certain inroads being made by the foreign producer, insisting that, by a proper and careful system of cultivation, success must attend the enterprise." We also learn that our imports of fruit and vegetables amount in the aggregate to a value of nearly £6,000,000 a year. From chapter xi., which treats on fruit, vegetables, and flowers, we glean much information regarding wholesale prices of the two first-named; thus we learn that "early forced Rhubarb will make about 2s. per 15 lb.

or £15 per ton; Seakale, 4d. per pound; Asparagus. early in the season, 3s. 6d. per 100, and not less than 1s. at any time; early Cabbage, £40 an acre; green Peas and Broad Beans, about £12 an acre; early Potatoes from the Channel Islands, £50 to £60 an acre; Kidney Beans, £25 to £30 an acre; other vegetables, such as winter Cabbage, Carrots, Parsnips, Turnips, Cauliflowers, &c., from £16 to £20 an acre." To the above we think the author should have appended the words:—These prices cannot be depended upon in either a good or bad season, as they fluctuate considerably, and are regulated entirely by supply and demand. Again, the author states that "late or old Potatoes will, with a fair crop, make £20 an acre." After such a statement it seems almost satirical for us to remark that vast quantities of old Potatoes have this year been sold without realising any profit at all, and a reference to our columns for June 2 will show that at that time they were unsaleable in one of our principal markets. Concerning many kinds of fruit prices are also given, as well as a list of those varieties which are the best to grow. About two pages are devoted to flowers, but there is nothing said which will be of any practical utility. We note the following as a specimen:—"Then again there are the lovely wild flowers in their different seasons, too often left to 'blush unseen and waste their sweetness on the desert air,' and which would pay to gather if the means of getting them to market were placed in the hands of the gatherers." What would Squire Jones or Farmer Smith say to persons whom they might meet in their fields or woods gathering wild flowers for market? Chapters iii. and iv. are devoted to poultry and bee-keeping. These are succeeded by one on "Distribution;" the forming of co-operative companies is strongly advocated, and the whole of the remarks relative thereto read very much like a prospectus with a view to floating a new concern. We are also told something about wines, jams, and pickles. Chapter vi. deals with railway rates, but nothing is stated that is different from what we have heard many times before. Agricultural education is briefly touched upon, and in chapter viii.—"Conclusion"—the author assures his readers "that the welfare and prosperity of the nation has been the motive urging and directing me to exert whatever small ability I may possess." This we fully believe, but we deprecate the circulation of this class of literature without the necessary precautions and warnings as likely to lead to disappointment.

## BEGONIAS AT MESSRS. LAING AND SONS.

THE Stansted Park Nursery has been, and is still, gay with many thousands of tuberous Begonias planted in long oblong beds, within view of the public road. There is no endeavour to obtain effects by contrasting colours, but rather convenience in comparing varying shades of particular decided colours; so that we found some beds filled with crimson, another with bright reds, others with pink, white or yellow—the main divisions into which the tuberous Begonia falls as regards its tints.

Constant selection of the best forms and brightest, darkest, or purest tints, as may be in each main section of colour desirable, is regularly and persistently followed out during the flowering season out-of-doors, several young men being employed in the work.

The actual raising is carried out under glass, from the fertilisation of the flowers to the gathering of the seed, but the flowering of the progeny and their final selection is done in the open air. The result of all these labours is a plant of floriferous, generally dwarf bushy habit, well fitted for beds in the flower garden, for vases, window-boxes, or for greenhouse decoration in the summer. These Begonias as a rule produce on a spike one male and two female blooms; and this not affording a long succession of bloom when grown in pots or baskets, Mr. Laing has seen the need of increasing the number of flowers on a spike, and has so far been enabled by

crossing and selection to get plants with two males and four to six females on a spike, thereby in some cases trebling the number of flowers, and rendering the plant when grown with widely divided shoots, as it is when placed in a hanging-basket, far more effective than was formerly possible.

Improvements in white varieties were noticed, where the pinky colour usually observed on the back of the petals had given place to almost pure white, a decided gain when the plants are used in the garden to give certain effects by contrast.

The season has not been favourable to the Begonia, and growth was late, and blossoms few, it being the middle of August before beds had even a moderately lifted appearance.

## HOME CORRESPONDENCE

**GARDENERS' ORPHAN FUND.**—Though this charity has progressed far more rapidly than the most sanguine amongst us expected, that is not a reason for slackening pace, or getting careless in respect of greater success. Such an idea has not entered the heads of the young gardeners associated together for mutual improvement in connection with the Royal Horticultural Society's Garden, Chiswick, who, according to a circular to hand, are proposing to have a *soirée* in aid of the Fund, in the Chiswick Vestry Hall, on the evening of October 17, the second day of the Apple and Pear Conference that is to be held at Chiswick. This is, I think, a very happy thought, and deserving of support, and as many gardeners and others interested in gardening, are likely to be in the neighbourhood at that time, it behoves them to strain a point in the endeavour to be present at the *soirée*, and so encourage the promoters in their laudable work. Yet another hint: as there are similar associations about the country, why not follow the lead that the Chiswick Association thus takes, and during the long evenings of the coming winter, devise at least one meeting or entertainment in aid of the Fund? The writer of this has already taken steps to practise what he has here preached, and as example is contagious, he expects to hear that many others mean to do the same. *W. W.*

**GIANT IRISH YEW.**—I notice a correspondent mentions a successful instance of moving an enormous Irish Yew of great age. He has doubtless recorded his success with the object of benefiting others that may require the necessary information, but unless he more fully describes his great feat he will not benefit his fellow-gardeners very much. It would be interesting to know where such a giant Irish Yew can be seen. I was under the impression that I had seen as fine specimens as are to be found, but they would have to stand on each other's heads to attain the height he gives, "50 feet." I have also found Irish Yews that have been growing a long time in the same position somewhat difficult to move successfully. *J. H. Goodacre.*

**THORBURN'S EVERBEARING CUCUMBER.**—I have given this American variety a trial in a cold pit, and also planted out-of-doors on a bed of manure. Owing to the past summer having been wet and cold, this, like other out-of-doors Cucumbers, has not done well out-of-doors; but in the cold-pit, where the plants were kept close, they produced egg-shaped fruits of 2 to 3 inches long, most abundantly, in clusters of from 3 to 5 from each joint; and although the fruits have a rough yellowish skin, they are crisp and palatable enough when sliced and partaken of in the usual way. However, the size and appearance of the Everbearing Cucumber being somewhat against it, it is not likely to find favour in this country, as the Long Prickly and Stockwood Ridge Cucumber are both a long way before it in point of size and appearance, in addition to being very productive bearers. *H. W. Ward.*

**PASSIFLORA CONSTANCE ELLIOTT.**—This fine white hardy Passion-flower is growing freely and blooming grandly on the new stables recently built at Ilanger Hill House, Baling, the residence of E. M. Nelson, Esq., J.P. This handsome block of buildings forms a parallelogram. The south front, which is planted with Ivies and flowering climbing plants, is the dwelling-houses of the coachman and grooms; the east wing is the harness-room and offices; the

west wing the coach-houses, and the north a twelve-stalled stable, in the centre being a spacious courtyard. The stables are fitted up with every convenience; they are lofty, airy, and commodious, with that thoughtfulness which is a leading quality in Mr. Nelson's character he has, on the south front, set apart some garden ground for the stablemen, in which they appear to find a great deal of pleasure and profitable occupation. *R. D.*

**HELIANTHUS ATROBURBENS, Linn.**—The name of *no* Sunflower has ever brought so much disappointment as the subject of this note. Hundreds of persons have purchased plants under the name, and have been disappointed time after time with either some other Sunflower, or a plant of quite another genus, until many have given up purchasing it under the name. I have myself obtained plants as *Helianthus atroburbens* from four different nurserymen, from two as late as May, 1888. In each case I received plants of a species of *Heliospis*, which many more, like myself, have been supplied with. Some, not knowing the difference between the two genera, have credited the *Heliospis* species as the true *Helianthus atroburbens* "Linn," while others have also long given up purchasing under the name, being convinced that such must have been from the first a *Heliospis*, and not deriving the former name. Others have been led by recent botanical records to consider it the same as *Helianthus rigidus* of recent authors and of the trade in part, but which is rightly *Helianthus diffusus*, and is well figured in *Bot. Mag.*, vol. xlv., t. 2020 [doubtful. Ed.], and published in 1818. This and its varieties are very handsome when in full flower, but are nearly past their best by the time *Helianthus atroburbens* begins. This, though of recent years, has been considered by some to be not distinct, was evidently for want of seeing a living or dried specimen of the true plant, which is quite a distinct species, and will be found figured in *Bot. Mag.*, vol. liii., t. 2668, and published in 1826, and which figure is sufficiently distinct to recognise a plant by, and had I seen it sooner I should have detected sooner its being in my possession; and the figure is sufficiently clear to prove that it is other than the same, or even a variety of *H. diffusus*, although it was evidently figured from a plant grown in a pot, and which had become impoverished. It is this way often grown, owing to its roots spreading in the same free manner as those of *Helianthus diffusus* and several other species; but when pot-grown, or the soil is at all exhausted, it assumes a very different character of growth; its leaves become much narrowed, and more evenly serrated, its stature dwarfed; its involucre reaches not more than half its proper length, and is almost as imbricate as in *H. diffusus*; while if planted out in rich soil in an open position, and under the same conditions as *H. diffusus*, these characters alter, and show it to be totally different from the latter and appropriately named species, equally handsome, cheap, and deserving extensive cultivation. *S. Appleton, St. John's Nurseries, Worcester.*

**ANNUAL LIFTING OF DAFFODILS.**—I hope that those who write on this subject will not suppose that I want to have the last word, for I can assure them that I read the notes of those who differ from me with as much interest as I do those who agree. On p. 189 Mr. Dod's remarks on N. Bernardi surely cannot apply to Daffodils in general, for it is a well known fact that some of the varieties cultivated on the Eyrewood do not adapt themselves to cultivation as garden forms do. Collected bulbs of N. pallidus precox with me make fine bulbs the first year; whereas the second year, lifted or unlifted, more so if not lifted, they are apt to get soft. I send you a sample of N. Bernardi bulbs collected last year and grown one year here they were lifted about the middle of July, and have been out of the ground since then, and I should be pleased if you would report on them [planted in border. Ed.]. Meantime, I shall wait with patience till next spring for a report on those which Mr. Dod has left in the ground. It may be a good theory, but I think it does agree with practice, that a bulb will get rid of wet in the ground that it cannot get rid of in a dry state. That dreadfully wet season 1879 taught me rather an expensive lesson. Bulbs planted in 1878 and left in the ground till 1880, when dug the best of them turned out to be less in weight than when planted, while some of the varieties disappeared altogether; whereas dried bulbs planted in 1879 and lifted in 1880 turned out fairly well, and I have obtained better results since from those lifted annually than those that re-

main more than one year, and my last four years' experience has been on both rich loam, and light sandy soil. I see on p. 263, Mr. Burbidge, when quoting me, seems to misplace my words; he there represented me to have said that drying or rather cleaning and storing Narcissus bulbs was an advantage to them; he again says the only point of difference between us is this question of drying, cleaning, and storing the bulbs. I have looked over my papers, and fail to find the words in the form as set forth by Mr. Burbidge on p. 63; what I recommended was to dry them in trays and plant the bulbs at once after having been cleaned (not store them); also on p. 490, I there stated, if stored in bulk after having been cleaned they will become mildewed, and if spread out they will get deteriorated. The only two points of difference between Mr. Burbidge and myself is the question of drying and cleaning. Mr. Burbidge thinks a bulb is being starved when out of the ground, whereas I believe there is no more danger, but a gain by a bulb being out of the ground a month or six weeks, having a rest, than there is for a man having six or seven hours sleep out of twenty four; and cleaning is just as conducive to its health as it is for a man to have a good wash after a night's rest before starting work. There was a time when it was my custom to lift and plant, but after commencing to sell, I was obliged to dry and clean my bulbs before sending them out to my customers. Those unsold and planted later than those that had not been cleaned and dried, came up earlier and flowered stronger—so much so, that the difference was discernible 50 yards away; therefore my custom is dig, dry, clean, and plant. There may be soil and situations where it may not be necessary to go to all this trouble and expense. I have simply given my experience as I have found it. *James Walker.*

**A PROLIFIC OAT-PLANT.**—Whilst out shooting a few days ago, one of my sons found amongst some young underwood an Oat-plant, which struck him as of such unusual growth, that he subsequently fetched it for me to see. It has apparently all sprung from one grain, and consists of sixteen stems, each of which carries the following number:—

Stem, No. 1	...	136 grains	Stem, No. 9	...	74 grains
" 2	...	129 "	" 10	...	104 "
" 3	...	158 "	" 11	...	132 "
" 4	...	155 "	" 12	...	129 "
" 5	...	122 "	" 13	...	99 "
" 6	...	103 "	" 14	...	50 "
" 7	...	113 "	" 15	...	88 "
" 8	...	120 "	" 16	...	124 "

A total of 1818 grains, besides many which had been previously picked by birds. The plant is about 6 feet high. I am sending the root for your inspection. *J. T. Rogers.*

**CHANGE OF COLOUR IN DAHLIAS.**—Could you, or any reader of the *Gardeners' Chronicle*, tell me the cause of this great change. Last year I had a quantity of Dahlias, many different colours. They were taken up and stored in the autumn; this season they were planted at the proper time and way, but, to my astonishment, nineteen out of twenty came when in flower a lovely white. *Old Subscriber.*

**HARDY FRUITS AT STOKES COURT, SLOUGH.**—When looking through the gardens at the above place, a few days since, I was particularly struck with the quantities of hardy fruit hanging on the various trees, and perhaps a few notes on some kinds that are fruiting so freely this season may be acceptable. The kitchen garden is surrounded with high walls, and in addition it is well sheltered on the northern side by a broad belt of Spruce Firs. On entering a door from the north side a row of Apple trees laden with fruit first attracted attention. These trees were at one time kept pruned and restricted in bush form, and very few Apples were obtained from them. Some twenty years, since Mr. Maher, the present gardener, not being satisfied with the crops produced, allowed the branches to extend, merely thinning them occasionally when required; and since this mode of culture was followed good crops have annually resulted. The trees are now 15 to 20 feet high, with long spreading branches, almost touching the ground, and on more than one occasion the surplus from the sixteen trees has been sold hanging for £20. The varieties are Ribston Pippin, Blenheim Orange, Wellington, Earm's Pippin, Dutch Mignonette, Cox's Orange Pippin, Cornish Aromatic, and Gooseberry Pippin, the latter a late and remarkably good keeper. Among Pears, Beurré d'Arc, Marie Louise, and Brown Beurré were well cropped; and a large standard tree of Knight's Monarch was carrying a heavy crop, but

in a very backward state, and not likely to come to maturity this season. Last year the fruit from this tree was of excellent quality, a hot season suiting this variety. I was also surprised to find the Peach crop generally on the walls very good. Part of the trees are protected with a coping of glass 3 feet wide, and others with only a double thickness of netting, the fruits under the latter being quite as abundant as under the portion that had received the glass protection. Waterloo and Hale's Early had already been gathered; Crawford's Early, Goshawk, Crimson Galande, and Dr. Hogg, very heavy crops, nearly ripe; Vanguard, good, and said to be a certain cropper; Walburton Admirable, rather late, and will need several weeks of fine weather to ripen; Lord Napier and Pittaston Orange Nectarines had good crops, the former ripe. Of Plums, I noticed Golden Drop, Kirke's, Washington, Angelina Burdett, and Victoria, with very heavy crops of nice fruit. *C. Herrin, Dropmore.*

**THE MUSCAT HAMBURGH GRAPE.**—This, perhaps the finest flavoured of all Grapes, may be grown successfully in a lower temperature than generally accorded Muscats. Some of the best examples I have yet seen were grown in a small span-roofed house where very little fire-heat was used, sufficient only in the early season for excluding frost from bedding plants stored in the house. I believe imperfect fertilisation has also much to do with the poor samples of this Grape often seen with small berries. To avoid this, with a soft brush we brush the bunches over daily when in bloom, having previously used it to set Black Hamburgh bunches so that it is full of pollen when applied to the Muscat Hamburgh. I enclose a small bunch, the last one of eighteen cut from a Vine growing in a Peach-house which has been open night and day since the Grapes commenced colouring, and where the temperature through the season seldom exceeded 60° from fire-heat. *H.* [The bunch was well set with fine berries. *Ed.*]

**DAMAGE TO THE TREES IN BATTERSEA PARK.**—Some ten days ago, when taking a walk through Battersea Park, I was terribly grieved to see the way in which the roots of the trees were being mutilated by the drainage works now going on. A trench about 4 feet deep had been cut, and was then remaining open, within 4 feet, or thereabouts, of the Elm on the one side, forming the beautiful avenue which extends from the entrance near the station across the Park past the subtropical garden. Very great and creditable care has been bestowed on these trees for some twenty or twenty-five years till they have become really handsome specimens when the work of years is thrown away by ruthlessly cutting off all the roots on the one side of the left-hand row: many of these roots are as large as one's wrist! Who is responsible for this? The act is so inconsistent with horticulture (or arboriculture) practice, and so at variance with other parts of the management in the same Park, that it does not seem credible that those who have the direct charge of the grounds could have sanctioned it. Had the channel for the drain been made through the centre of the avenue little or no harm would have been done to the trees. *G. E.*

**NEW VEGETABLES.**—Mr. Wilkes is doubtless an excellent gardener, but I think, in the estimation of most readers, he puts himself out of court in the matter of capacity to distinguish between the merits of allied varieties of vegetables when he intimates his inability to find any appreciable difference between New Intermediate and Long Red Surrey Carrot. That he should have only seen the former, now very popular and almost universally grown Carrot at Shrewsbury leads to the inference that in not having grown it himself he is behind the age. But thus it is that we find some critics railing against new things without having grown them. I believe most gardeners will admit that there has been with nearly all kinds of vegetables a remarkable advance in quality during the past twenty years; indeed, it would be impossible for so enterprising a body as our seed trade is to stand still and accept what is as finality. Now and then such a very fine vegetable as the Autumn Giant Cauliflower, New Intermediate Carrot, the Seville Longpod Bean, or similar novelty bursts upon us suddenly, but generally improvements are slowly progressive, as in the case of Peas, Potatoes, Cabbages, Onions, &c., so that the improvements fail to strike us as being so very remarkable, and yet they are so. Any check to this development would mean to the seed trade stagnation and ruin. *Permit*

me to say that I have not asserted that Sutton's Little Gem Cabbage is a development from Little Pixie Cabbage. I only referred to those kinds in conjunction in a previous note to illustrate the progress of development in vegetable improvement, but I have not the least knowledge as to whether there is any lineal connection between the kinds named. Sometimes kinds of very dissimilar character will produce others equally dissimilar after intercrossing. It is hard work to fix and maintain these breaks, and on the whole most admirably do our seed trade accomplish it. *A. D.*

**HEATED BORDERS IN THE OPEN AIR.**—I send you a Pine-apple, and some Peach and Nectarine fruits ripened in my "Hypocaust," or heated earth garden, in the open air. One Peach and one Nectarine, supplied by Mr. Rivers for the purpose, with the fruit well set, were plunged in the hot earth, and the Pine-apple, a small-fruited sucker, was planted right out. This was in the first part of June. The Peach and Nectarine never suffered a check and are now in healthy and luxuriant foliage. The fruits I send were attacked by slugs and so dropped. The Pine grew strongly, and the fruit, about the size of a green Walnut when put out, had become yellow and perhaps ripe, ten days before. *R. Trevor Clarke.*

## SOCIETIES.

### ROYAL HORTICULTURAL.

**TUESDAY, September 25.**—A small meeting took place at the Drill Hall, James Street, Westminster, on the above date, Dahlias and Roses being the chief attraction, the former by Messrs. Turner, Slough; Keynes, Williams & Co., Salisbury; West, Brentwood; and Rawlings, of Roumford; and Roses by Messrs. W. Paul & Son, Waltham Cross.

A splendid group of Guernsey Lilies, from Baron Schroder's garden; a collection of hardy plants from Mr. T. S. Ware; Nepenthes from Mr. B. S. Williams, Holloway; and fruit from Messrs. J. Veitch & Sons' nursery were the other items of interest.

### Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. W. Bates, H. Herbst, W. Wilks, T. Baines, R. Dean, B. Wynne, J. Dornay, H. M. Pollett, J. O'Brien, W. Holmes, E. Hill, G. Duffield, W. Goldring, J. Walker, W. H. Lowe, and J. Fraser.

Messrs. J. Veitch & Sons, Royal Exotic Nurseries, Chelsea, showed a group of hardy shrubs, the most conspicuous object being several flower-spikes of *Hydrangea paniculata grandiflora*, about 18 inches in height; they had been cut from plants planted in May last; *Berberis Thunbergii* in fruit, and with the autumnal red tint on its leaves, was also a pretty object; also in berry, were *Cotoneaster uniflora* and *Crataegus pyracantha Landaei*, which last is a remarkably pretty thing and very useful for decorative purposes; *Daphniphyllum glaucescens viridis* was also shown. There was also a fine *Canna* from the same firm, named *Geoffroy St. Hilaire*, with deep red-brown foliage and rich scarlet flowers of large size, the whole plant being rather tall; *Louis Thibaut*, yellow spotted with rich red, was another pretty *Canna*. Several trusses of bloom of hybrid *Rhododendrons* completed the group.

Several named *Cannas* were also sent by Messrs. H. Cannell & Sons, Swanley, Kent, and made a good display. *Gerard's* *Andrian*, Indian-yellow flushed corolla, and *Paul Bert*, orange-rose flower, being specially noticeable. The same firm also showed a collection of fine single and double blooms of tuberous *Begonias*, *Chrysanthemum Sam. Henshaw*, a lake-coloured Japanese variety, of the style of *Madame Andouguier*; and the yellow *Juarezii* *Dahlia*.

A few specimens of late flowering *Asters*, of the Lilliput section, and spikes of the sweetly-scented *Hedychium Gardnerianum* were sent from the Society's Gardens at Chiswick.

In one corner of the hall a brilliant show was made by a large group of *Nerine Fothergillii*, sent by Mr. H. Ballantyne, gr. to Baron Schroder, The Dell, Egham. The plants were well grown and vigorous, presenting a sheet of bright colour.

Mr. B. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, N., showed a collection of *Nepenthes*, in fine specimens, numbering about thirty plants, *Excelsior*, with numerous large pitchers, *Mastersiana*, *amabilis*, and *Dormaniana* being best shown; and *Hookeriana*, *Williamsi* and *intermedia*

were also good. Also an ornamental-leaved Beet, McGregor's Favourite, with narrow leaves about 6-8 inches in length, folded inwards, and deep purple-brown in colour.

From Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, there came a group of miscellaneous hardy cut flowers and plants: Shirley and Iceland Poppies were conspicuous, especially the former, and Gallardias, small-flowered Sunflowers, Chysanthemum maximum, C. leucanthemum, hybrid Primroses, Catananche corulea, and C. bicolor, large Kniphofias, and Lilies were also numerous. The following plants were observable:—Nerine excellens, rose, with a darker centre nerve to each segment, and of dwarf habit; Satyrium carneum, a good semidouble form of Harpalium rigidum, Aster Townsendi, with flowers about 1½ inch in diameter, disc yellow, rays rich violet, very pretty; Lilium Wallichianum, with segments of a pale cream-colour, darker at the base, a green nerve in the lower half of each segment, leaves linear. A white Scabious, called Snowball, and S. caucasica, represented by a large flowered plant, were good. A few Dahlias were also shown. Professor Baldwin, a flower like Juarezii, but of a true scarlet colour, and Lizzie Abart, a double decorative variety, white, suffused with deep lilac towards the margins of the segments, were good. Single flowers were also contributed.

A large exhibit was made by Messrs. Paul & Son, Cheshunt, who staged a collection of Dahlias and hardy cut flowers. Numerous Asters (Michaelmas Daisies) were to be seen, and Helianthus multiflorus major, a very striking bright flower; Catananche corulea and C. bicolor, Asclepias tuberosa, Coreopsis lanceolata, Senecio pulcher, with various Phloxes and Delphiniums. Dahlias were, however, the chief portion of the firm's exhibit, and several boxes and stands of good flowers were shown. Of the decorative or Cactus varieties, Annie Harvey, Germania Nova, Lady E. Dyke, Henry Patrick, and Lady Kerrison were good exhibition and fancy; Champion Rollo, J. Huntley, W. H. Williams, Chorister, Sunbeam, and Galety; single flowers: Beauty of Uplands, Mrs. H. Whitfield, White Queen, and Canterbury Tales. Red Cockatoo, a bright red semidouble decorative; and Scarlet Macaw, similar, but scarlet, were distinct varieties.

A collection of very handsome Dahlia blooms was sent by Mr. J. T. West, gr. to W. Keith, Esq., Cornwall, Brentwood. The flowers were large and in good form, chiefly show and fancy, with a few decorative. The best were:—R. F. Rawlings, Shirley Hibberd, Mrs. Gladstone, Harry Keith, G. Barnes, Queen of the Belgians, Henry Walton, Galety, and Lord Chelmsford. A capital collection was also sent by Messrs. Rawlings Bros., Romford, all even and clean blooms.

The Dahlia exhibits of Messrs. Keynes, Williams & Co., consisted of eight dozen blooms of show varieties of very fair quality. The best were Matthew Campbell, orange, irregularly striped with scarlet; Major Bartelot, of the same ground colour as the first-named, but profusely striped with scarlet. In miniature (pompon) Dahlias, likewise rather abundantly shown, the best varieties were Little Darkie, a dark chestnut-purple; Little Ethel, white, with a lilac centre; Whisper, canary-yellow, lightly tipped red; Eurydice, a pretty thing, light puce, with petals purple-tipped.

In decorative (hybrid Juarezii type) there were some distinct-looking flowers, but the only one considered to be worthy of distinction was Honoria, a canary-yellow flower.

Mr. C. Turner's Dahlias contained many superb flowers, as many as six new varieties from seed obtaining Certificates. These were, in pompon varieties:—Lothair, yellow, heavily tipped and bordered with bright scarlet; Admiration, purple, with white tips; Juliette, yellow, with an orange centre; Vivid Scarlet, very bright. In show varieties:—Hugo, a crimson; and Agnes, bright yellow, were the only certificated examples.

Mr. R. P. Jones, The Grove, Brill, Bucks, exhibited a small single variety of D. scabra The Fairie, purple-white, 1½ inch in diameter.

Messrs. Paul & Son, Old Nurseries, Cheshunt, showed a stand of seedling single-flowered and one of decorative Dahlias; Red Cockade was distinct in the former, and Queen of Lilacs in the latter. R. T. Rawlings, G. Rawlings, Queen of the Belgians, Rev. J. Goodday, Harry Keith, Prince of Denmark, Mrs. Rusby (decorative), Masterpiece (single), purple-lake with white tips.

Mr. G. Humphries, Kingston Langley, Chippenham, also showed good even Dahlia blooms—Christy Ridley, J. Huntley, R. T. Rawlings, Joseph Ashby,

Salamander, and Seraph were good show and fancy varieties; while of Cactus blooms Constantine, E. C. Henley, Mrs. Tait, W. Pearce, S. Holland, and Mrs. Hawkins were fine. J. Cooper, a new fancy flower, was white, suffused with lake, with numerous small spots of intense lake, and occasional blotches of the same.

Messrs. W. Paul & Son, Waltham Cross, contributed an extensive collection of cut Roses, which were very good at this late season of the year; Ulrich Brunner, The Bride, Alfred Colomb, Niphetos, Countess of Rosebery, Anna de Diesbach, Souvenir de la Malmaison, Gloire de Dijon, and other well known varieties were well represented. Cut bunches of red and white Lapageria were also sent.

G. F. Wilson, Esq., Weybridge, sent a few specimens of Lilies which had been flowered in the open at Oakwood.

A plant of Cynochos chlorochilon was sent by F. G. Tauts, Esq. (gr. Mr. Cowley). This species was the 'subject of an illustration in our issue for Feb. 4 last.

A box of Celosia spikes from Mr. S. Ford, Leonard, Gardens, Horsham, was much admired; they were vigorous and brightly coloured. (Strain Commended.)

Pentstemons and a dwarf Carnation were shown by Mr. R. Dean, Baling; and Messrs. J. Cheal & Son, Lowfield Nursery, Crawley, had their flower-holders, and a good new single Dahlia Lady Montefiore, sulphur, with a suffused lake margin.

#### FIRST-CLASS CERTIFICATES.

Nerine excellens, from Mr. T. S. Ware.  
Lilium Wallichianum, from Mr. T. S. Ware.  
Aster Towushendi, from Mr. T. S. Ware.  
Harpalium rigidum semi-plenum, from Mr. T. S. Ware.

Canna Paul Best, from Messrs. H. Cannell & Sons.

Canna Geoffrey St. Hillaire, from Messrs. J. Veitch & Sons.

Ornamental Beet, McGregor's Favourite, from Mr. B. S. Williams.

Dahlia John Cooper, from Mr. Humphries.

Dahlia Maud Fellowes, from Mr. C. Turner.

Dahlia Hugo, from Mr. C. Turner.

Dahlia Juliette, from Mr. C. Turner.

Dahlia Admiration, from Mr. C. Turner.

Dahlia Vivid, from Mr. C. Turner.

Dahlia Lothair, from Mr. C. Turner.

Dahlia Panthea, from Messrs. Keynes, Williams & Co.

Dahlia Honoria, from Messrs. Keynes, Williams & Co.

Dahlia Matthew Campbell, from Messrs. Keynes, Williams & Co.

Dahlia Little Darkie, from Messrs. Keynes, Williams & Co.

Dahlia Eurydice, from Messrs. Keynes, Williams & Co.

Dahlia Little Ethel, from Messrs. Keynes, Williams & Co.

Dahlia Whisper, from Messrs. Keynes, Williams & Co.

Dahlia Lady Montefiore, from Messrs. J. Cheal & Sons.

#### MEDALS.

Silver-gilt Banksian.—To Mr. B. S. Williams, for group of Nepenthes.

Silver Banksian.—To Messrs. H. Cannell & Sons, for a collection of cut flowers; to Messrs. J. Veitch & Sons, for group of plants; to Messrs. Keynes, Williams & Co., for a collection of Dahlias; to Mr. T. S. Ware, for a collection of cut flowers; to Messrs. Paul & Son, for a collection of Dahlias; to Baron Soder, for a group of Nerines.

Bronze Banksian.—To Mr. G. Humphries, for collection of Dahlias; to Messrs. W. Paul & Son for cut Roses; to J. F. West, Esq., for collection of Dahlias.

#### Fruit Committee.

Present: John Lee, Esq., in the chair; and Messrs. J. Smith, G. W. Cummins, J. Cheal, T. J. Saltmarsh, R. D. Blackmore, T. F. Rivers, W. Marshall, S. Ford, H. Weir, P. Crowley, P. Barr, and T. B. Haywood.

From the nurseries of Messrs. J. Veitch & Sons, Chelsea, there were twenty-six dishes of Plums, in distinct varieties, mostly of more than ordinary size, but conspicuous, as are most out-of-door fruits, by want of flavour. A small collection of culinary and dessert Apples was from the same firm, some of the fruits shown being of extraordinary size, especially

those of Lord Grosvenor, Red Quarrenden, Grenadier, Stirling Castle, and Nilton House, a Scotch variety, of good appearance, and a very long keeper. A small collection of Pears for dessert were likewise shown. A Silver Banksian Medal was awarded.

One of the heaviest Queen Pines ever exhibited came from Mr. Richards, gr. to Lord Normanton, Somerley, Ringwood. The fruit was quite symmetrical and nearly ripe, weighing 7 lb 6½ oz. A Cultural Commendation was awarded.

Messrs. Hurst & Son, 152, Houndsditch, exhibited a massive looking Cucumber, a cross between Telegraph and Blue Gown.

Mr. W. P. Fairgrieve, Dunkeld Gardens, Dunkeld, N.B., sent a small collection of capital Plums, and a few Apricots and Peaches, but it arrived too late for the Committee. Of Plums, Pond's Seedling and Magnum Bonum, Jefferson, and Imperial Gage, were excellent and large; Pitnanton Orange Nectarine and Hale's Early, and Early Louise Peaches were also of good appearance, but small.

A few Melons were sent—one from Mr. C. J. Waite, Glenhurst Gardens, Essex, being excellent in flavour; the flesh was green, juicy, and tender.

W. Rouppel, Esq., Rouppel Park, S.W., showed an American Tomato, Canadian Peach, small and round, stated to be of a very sweet flavour.

#### CERTIFICATE.

Melon Glenhurst Perfection, from Mr. C. J. Waite.

#### MEDAL.

Silver Banksian.—To Messrs. J. Veitch & Sons, for a collection of fruit.

### NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.

The annual meeting of this Association was held in the Music Hall Buildings, Aberdeen, on Friday evening, the 21st inst., Mr. Cocker, President of the Association, in the chair.

The Chairman gave a short address, in which he regretted that they had not larger attendances at their meetings, and expressed the earnest hope that in the future a more extended interest would be manifested in the affairs of the Association. He particularly alluded to the advantage that would be derived by young men attending the meetings. Mr. Cocker was re-appointed President, Mr. Smith, Vice-President; and Mr. Reid, Secretary. Mr. Thomson was appointed Treasurer in room of Mr. Wylie, who resigned. Members of committee were also appointed. It was arranged to hold meetings once in three weeks. The programme as submitted was approved. A vote of thanks to the Chairman closed the proceedings.

## THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING OCT. 6. (AVERAGE OF FORTY-FOUR YEARS.)

Sept. 30 ... ..	55° 0	Oct. 4 ... ..	54° 0
Oct. 1 ... ..	54° 7	" 5 ... ..	53° 7
" 2 ... ..	54° 5	" 6 ... ..	53° 4
" 3 ... ..	54° 2	Mean for the week ...	54° 2

### THE PAST WEEK.

The following summary record of the weather for the week ending Sept. 24, is furnished from the Meteorological Office:—

"The weather has continued fine and dry generally in all parts of the kingdom. Much fog and mist were, however, experienced in various localities and exceptionally heavy dews prevailed. At the end of the period the conditions were less settled, and rain fell at our more southern and extreme northern stations. In the extreme south some thunder and lightning occurred.

"The temperature has been rather above the mean in the 'Channel Islands,' the south and east of England, and in the north and east of Scotland, but a little below it in most other districts. The highest of the maxima, which were recorded on somewhat irregular dates, ranged from 66° in 'Ireland, N.' to 72° in 'England, E.' 'England, S.' and the 'Midland Counties,' and 75° in 'Scotland, N.' The lowest of the minima, which were also registered

at varying times, ranged from 32° in 'England, S.W.' to 44° in 'England, E., and 'England, S.' and to 53° in the 'Channel Islands.' On most days the range of temperature was unusually large, especially over Scotland.

"The rainfall has been much less than the mean in all districts. At many stations measurable quantities of dew were collected in the gauge.

"Bright sunshine has varied considerably in different localities; but on the whole it has been less prevalent than it was last week. The percentage of the possible amount of duration ranged from 18 to 55 in Scotland, from 26 to 39 in Ireland, and from 28 to 51 in England. In the 'Channel Islands' the percentage was 67."

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

**ANEMONE JAPONICA ALBA, HONORINE JOBERT.**—This is well said to be one of the most beautiful ornaments a garden can possess during the autumn. A fine bit of it may be seen in full flower at the present time at the Royal Horticultural Society's Gardens, Chiswick. Those in search of a subject that will produce a long succession of flowers, should not fail to add this Anemone to their collection. *B.*

## ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

**TREES FOR SANDHILLS.**—What kind of forest or ornamental trees will best grow upon the sandhills which extend along portions of the north-west coast of England, and are composed entirely of the sea-sand blown up from the shore by the prevailing west winds, and will any kind of tree grow in it without first enriching it (the soil) with manure or other soil? What is the best treatment to give the sand to make it fit for gardening purposes generally, and what fruit or vegetables is it best adapted for? *Doubtful.*

## NOTICES TO CORRESPONDENTS.

**BOOKS—BUDDING AND GRAFTING OF FRUIT TREES:** *J. R.* The work by Du Breuil is one of the best; Lockwood & Co. Stationers' Hall Court, Ludgate Hill, London. *Baltet's Art of Grafting*, Robinson, 37, Southampton Street, Strand.

FIG. 50.—PINE BEETLE.

FIG. 51.—PINE SAWFLY.

**CORRECTION.**—In article entitled "Ardgowan," p. 332, first line of col. c. for "present Baronet," read "present Baronet's mother." *W. S.*

**DISEASED BULBS: Puzzled.** They were badly infested with the bulb mite, and the parts worst decayed with a species of yeast-fungus. In the state in which the bulbs sent were, there is no remedy for them. Burn them and the soil in which they grew. See a note on diseased Eucharis in our issue for September 8 last, p. 274.

**EXHIBITING: Reader.** In the case represented we think the judges were right in disqualifying your exhibits, the larger number of things shown being salad plants and fruits, and not "vegetables," in a culinary sense.

**FICUS REPENS: Young Gardener.** This is an accommodating plant, growing well either in a cool or warm temperature; indeed, it takes several degrees of frost to destroy it when well established. It grows with the most vigour in a moist hothouse.

**FUNGUS: N. N.** It was probably *Phallus impudicus*. It can be got rid of by digging up the soil and extracting the spawn. Manuring and cultivation are inimical to its growth. If there are no plants to injure, you might water the soil with strong brine made hot before applying it.

**FUNGUS ON GRAVEL PATH: P. B.** An Agaric; too young to be named.

**FUNGUS ON SENECIO FULCHER: X.** *Coleosporium senecionis*.

**GRUB: W. S., Melton.** The caterpillar of the death-head moth (*Sphinx atropos*). Destructive to Potatoes, &c.; generally feeds at night.

**LATENER: Admiral Cator.** Loamy soils of medium texture, and easily worked. Plants could be obtained from Mr. Perks, of Hitchin, a large grower; or of the growers at Mitcham, Surrey. Cuttings (slips) could be put in well prepared beds next month, and after remaining there for one year may be set out. The number required for 1 acre is about 3547, at 1 yard apart, and 4 feet between the rows.

**MELON PEAR, OR PEPINO: F. G. C.** It is not hardy in this country; and is of very little value as an edible fruit.

**NAMES OF PLANTS: W. M. C.** *Ophiopogon Jaburan variegatus*;—*A. C. H.* *Trifolium arvense*.—*B. P.* 1, *Atriplex hortensis* var. *sanguinea*; 2, *Tanacetum vulgare*; 3, *Datura Stramonium* (poisonous); 4, *Lupinus polyphyllus*; 5, *Helianthus decapetalus*; 6, *Eriogonum* (*Godetia*) *Duchess of Albany*.—*C. E.* 1, *Hieracium aurantiacum*; 2, *Doronicum austriacum*; 3, *Veronica longifolia*; 4, *Spiraea filipendula*; 5, *Lychnis chalcidonica*; 6, *Trollius europaeus*; 7, *Achillea Ptarmica*, fl. pl.; 8, *Cenothera linearis*; 9, *Pentstemon gentianoides*.—*J. M. G.* 1, *Ceanothus azureus*; 2, *Reineckia carnea*; 3, *Cineraria maritima*; 4, *Aspidium falcatum*.—*H. J. Ross.* *Epidendrum chondrophyllum*.—*H. S.* *Veronica*: a seedling form of *V. Andersoni*.—*L. C. H.* 1, *Helianthus atrovirens*; 2, *Gaillardia pulchella*; 3, *Helenium autumnale*; 5, *Mesembryanthemum* sp.; 6, *Senecio (Jacoba)* *purpurea*.—*J. C.* *Lilium longiflorum*; *Pleroma macranthum*.—*W. F.* 1, *Pteris tremula*; 2, *Mühlenbeckia confusa*; 3, *Pittosporum undulatum*; 4, *Hydrangea Thunbergii*; 5, *Adiantum Capillus-veneris*; 6, *Zephyranthes minima*.

**NECTARINES SHRIVELLING: A. J. A.** The immature fruits shrivel from deficiency of vigour in the trees, or from exhaustion due to over-cropping. Examine the borders, and water them thoroughly if found to be dry, manuring with bone-meal; or taking the old soil away, if very poor, replacing it with friable loam which has been stacked one year, and an eighth of nearly fresh horse-droppings. Stem-scorching by sun-heat will often paralyse the energies of a tree, and that may readily have happened in the last and preceding years.

**PELAGONIUM AT THE ZOOLOGICAL GARDENS: Alexander.** We do not know. You should apply to the Superintendent at the gardens.

**PINE PESTS: D.** We suspect from your description that the culprit is the grub of the Pine Beetle, or perhaps, the Pine Sawfly. We give illustrations (figs. 50 and 51) of both. Burn all rubbish that falls from the tree as far as possible.

**POTATOS: Frythe.** The tubers furnish a good example of what is known as superabundant, of course at the expense of the stores in the parent tuber. The tubers on the haulm are generally the consequence of some injury to the underground portion from wireworm, slugs, or other cause. They show very clearly that the tuber is only a modified branch, or shoot.

**SILVERING LIQUID: F. J. C.** Apply to any large chemist.

**TABERNEMONTANA LEAVES: Lee.** The leaves are covered with little pimples, analogous to warts on Vines, which are the result of too little ventilation in proportion to the heat.

## CATALOGUES RECEIVED.

Melons, each	1-0-3		

## SEEDS.

LONDON: Sept. 26.—Messrs. John Shaw & Sons,  
seed merchants, of 37, Mark Lane, E.C., write  
that the chief feature of the last few days' trade  
has been a strong speculative demand for Alsike  
and White Clover-seed, under which a substantial  
advance has been established. Red Clover seed  
keeps firm. It now looks as if the English crop  
would be a complete failure. Extreme figures are  
obtained for Trefoil. Italian and perennial Ryegrass  
supplies unchanged. Winter Tares are steady;  
supply about meets the demand. Trifolium realises  
former rates. Canary seed tends upwards. There is  
no alteration in Hemp seed. Blue Peas are in good  
request at improving rates.

## CORN.

Averages.—Official statement showing the average  
price of British corn, imperial measure, in the week  
ended September 22:—Wheat, 34s. 11d.; Barley,  
32s. 5d.; Oats, 17s. 2d. For the corresponding  
week in 1887:—Wheat, 29s. 9d.; Barley, 28s.;  
Oats, 14s. 11d.

## FRUIT AND VEGETABLES.

SPITALFIELDS: Sept. 26.—Trade continues some-  
what dull for very fair supplies of fruit and vege-  
tables generally, at following quotations:—Apples,  
3s. to 5s. 6d. per bushel; do., 1s. 6d. to 2s. 9d.  
per half-bushel; Damsons, 3s. 3d. to 3s. 6d. per half  
sieve; English Green Gages, 7s. to 8s. per bushel;  
Pears, 3s. to 5s. 4d.; English Plums, 2s. to 3s. 6d.  
per half-sieve; English Tomatoes, 5s. to 8s. per peck;  
foreign do., 3s. to 4s. 6d. per box of 18 lb.; foreign  
Plums, 1s. 3d. to 2s. 3d. per basket; Vegetable  
Marrows, 1s. 6d. to 2s. 6d. per tally; Cabbages, 1s. to  
2s. do.; Cauliflowers, 9d. to 1s. 3d. per dozen; French  
Beans, 1s. 6d. to 1s. 9d. per bushel; Scarlet Runners,  
9d. to 1s. 3d. do.; foreign Onions (Belgian), 2s. 3d.  
to 2s. 6d. per bag of 110 lb.; Dutch Onions, 3s. to  
3s. 6d. per bag; Turnips, 2s. to 2s. 6d. per dozen  
bunches; Carrots, 1s. 3d. to 1s. 6d.; Beetroots,  
1s. 3d. to 1s. 6d.; Mint, 1s. 3d. to 2s. 6d. do.;  
Parsley, 1s. to 1s. 6d. do.; pickling Onions, 3s. 6d. to  
4s. per bag; common do., 4d. to 6d. per dozen bunches;  
Endive, 1s. 6d. per dozen; Cos Lettuce, 5d. to 6d.  
per score; Carrots, 24s. to 36s. per ton.

STRAFORD: Sept. 25. Both trade and supply  
have been good during the past week. Prices:—  
Cabbages, 2s. to 3s. per tally; Cauliflowers, 2s.  
do.; Turnips, 2s. per dozen bunches; do., 30s.  
to 35s. per ton; Carrots, household, 30s. to 40s.  
do.; Mangels, 16s. to 20s. do.; Swedes, 18s. to 20s.  
do.; Pears, 2s. 6d. to 5s. per bushel; Apples, 3s. 6d.  
to 5s. do.; do., 6s. to 6s. 6d. per case; Plums, 3s.  
to 3s. 6d. per half-bushel; Carrots, 2s. per dozen  
bunches; Celery, 10d. to 1s. per roll; Beetroot, 3s.  
per dozen.

## POTATOS.

BOROUGH AND SPITALFIELDS: Sept. 25.—With only  
moderate supplies prices are firm for best samples,  
but all other grades show no improvement:—Reg-  
ents, 50s. to 70s.; Hebrons, 50s. to 90s.; Early  
Roses, 50s. to 80s.; Magnum Bonums, 50s. to 90s.;  
Myatts, 45s. to 60s. per ton.

SPITALFIELDS: Sept. 26.—Quotations:—Beauty  
of Hebron, 60s. to 70s.; English Regents, 60s. to 75s.;  
do. kidneys, 65s. to 75s.; Early Rose, 50s. to 60s.;  
Imperators, 60s. to 65s.; and Magnums, 50s. to 60s.  
per ton.

STRAFORD: Sept. 25.—Quotations:—Magnums,  
50s. to 60s.; Beauty of Hebron, 40s. to 70s.; Early  
Rose, 50s. to 60s.; Imperators, 55s. to 70s. per ton.

Imports.—The imports into London last week  
consisted of 8 bags from Hamburg.

## HAY.

Bug, Caterpillars, &c., &c.

PERFECTLY } Kills Grubs and Skin, but will cure  
HARMLESS } Ringworm in Animals, and all diseases  
produced by parasites.

## FIR TREE OIL (SOLUBLE) INSECTICIDE

A combination of Hydrocarbon Oils, made soluble in  
Water, for destroying all INSECT PARASITES  
that infest Trees and Plants, whether at the Roots or  
on the Foliage.

Prepared by Seedsmen and Chemists, 1s. 6d., 2s. 6d., 4s. 6d.,  
1 gallon 7s. 6d., 1 gallon 12s. 6d., or less in larger quantities.  
A Treatise on FIR TREE OIL as an INSECTICIDE,  
its Application to Plants and Animals, sent Post free  
on receipt of address, by the Manufacturer.

## Important Notice.

FIR TREE OIL so well-known as an Insecticide, is  
essential for washing household Cotton, Linen, and  
Woolen Fabrics, and its disinfecting, bleaching, and  
cleansing qualities when added to water for washing pur-  
poses, will, after the first trial, recommend itself.  
No Dry Soap, or any such preparations must be used  
with Fir Tree Oil.

Half a wineglass-full of Fir Tree Oil to 10 gallons of  
water for steeping, and the same quantity to an ordinary  
size boiler for boiling, with half the usual quantity of  
household soap, will do the work splendidly, and with  
half the trouble.

For washing Hogs, Pigs, and other animals, half a  
wineglass-full to a bucket of water, and used with ordi-  
nary soap, will do better than any of the prepared soaps  
for killing fleas, preserving the skin healthy, and making  
the coat silky and very beautiful. One trial will be  
conclusive.

P.S.—Paraffin Oil will mix with Fir Tree Oil in proportion  
of a quarter of a pint of the former to a pint of the  
latter, and become soluble in water.

**MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus.**  
Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse-building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price 2s. post-free.**  
A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

## SPHINCTER GRIP GARDEN HOSE

The Sphincter Grip Spring Steel Galvanised Armoured Hose is the most valuable improvement in Hose since 1840. Its lasting qualities are ten times greater than any Hose not armoured.

Its complete success has caused some parties to infringe the Patents owned and controlled solely by us; and we therefore notify all such that the making, vending, or use of any armoured wire-wound Hose not of our manufacture is an infringement of one or more of our several Patents, any violation of which will be promptly prosecuted. Brass plates set between the Hose and wire denote our Manufacture and the Patents.

### TESTIMONIALS.

Messrs. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 23,000 feet of piping in them, varying in size from 1½ in. to 8 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5,000 feet of 4-inch pipe in one of my vicineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

Yours faithfully,

(Signed)

G. W. BASHFORD.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

Completion of a great National Work.  
**THE PINETUM BRITANNICUM.**  
A Descriptive Account of Hardy Coniferous Trees Cultivated in Great Britain. Dedicated, by command, to the illustrious memory of H.R.H. the Prince Consort. Illustrated with Maps, Photographs, Facsimiles of the Original Water-colour Drawings, made expressly for the work, and 643 Engravings on Wood. Edited, with the assistance of Robert Brown, Dr. Lindley, Dr. Maxwell T. Masters, Messrs. Peter Lawson & Son, by EDWARD RAVENSCROFT. Three vols., royal folio, with fifty-three large Coloured Plates and 643 Woodcuts (subscription price £17 6s. unbound), now offered at a reduced price, plain plates, hf. bd., 210 lines; or, coloured plates, hf. bd., olive morocco, £21.

As long as we are enabled to congratulate Conifer lovers, subscribers, authors, and publisher, upon the completion of the *Pinetum Britannicum*. The work is one of great magnitude and beauty, and one that has involved labour and pecuniary outlay, it is to be feared, beyond hope of recompense. In the preface Mr. Ravenscroft, the enterprising and chivalrous publisher and part author, tells the story of the book—how it grew out of a small catalogue raisonné prepared for Messrs. Peter Lawson & Son. As a considerable amount of materials had accumulated, the larger work, with its large-sized coloured plates, was undertaken. Messrs. Lawson lent substantial aid by taking 100 copies of the Emperor Napoleon distributed thirty copies among the Schools of Agriculture and Forestry in France, and royal patronage was not wanting in our own country. Such aid, however, was not sufficient to defray all his unobstructed progress of the work. The firm of Peter Lawson & Son met with misfortune, the French Empire underwent still greater disaster, and, as a consequence, the publication of the work was necessarily for a time suspended. In order, however, to keep faith with the remaining subscribers, Mr. Ravenscroft lately resumed the publication, and has now, as we have seen, brought it to a close thus fulfilling all his obligations to his subscribers, if not fulfilling the whole of the ambitious programme with which he set out.

from the Largest Manufacturer in the Trade,  
**H. C. SMYTH,**  
21, GOLDSMITH STREET,  
DRURY LANE, W.C.

**THE LOUGHBOROUGH GREENHOUSE**  
**HOT-WATER APPARATUS.**

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stove-hole, and no hot-water filter for fixing. The Boiler stands in the middle of the house, so that the whole of the heat from the Boiler itself is utilised. It burns over twelve hours without attention, at a nominal cost. Manufactured with Boiler, open feed syphon, 12 ft. of 4-inch hot-water pipe, and patent joints, complete, £24 4s. Delivered free to any station. Discount for cash. Cost of apparatus complete for Greenhouses as below, delivered free, with pipes cut and fitted ready for fixing.

Price, as engraving, with Boiler, open feed syphon, 12 ft. of 4-inch hot-water pipe, and patent joints, complete, £24 4s. Delivered free to any station. Discount for cash. Cost of apparatus complete for Greenhouses as below, delivered free, with pipes cut and fitted ready for fixing.

#### Covent Garden Market.

**SALESMAN, or ASSISTANT to Grower or Commission Agent.**—Thoroughly conversant with the Trade in every detail, also Buyers both in Town and Country; or would accept London Agency for Provincial Firm, &c.—*Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**TO SEEDSMEN and FLORISTS.—Advertiser (age 27)** seeks re-engagement. Twelve years' thorough practical experience in London and Province Houses. Unexceptional references.—T. Y. Z., 234, Liverpool Road, Islington, N.

**TO THE SEED TRADE.—Wanted, by a young man (age 24),** a situation in either a Wholesale or Retail Seed Establishment. Six years' experience in General Nursery Stock.—H. H., The Royal Nursery, Slough.

**YOUNG LADY, slight knowledge of Florist's** Business, of good address, would give part time in an establishment where she could gain a thorough knowledge of the above. Indoors preferred. Good reference.—FLORA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**LABOURER, in a Nursery or Gentleman's** Garden.—Age 20; good character.—A. G. CARBERT, Bilbrough, York.

**HOLLOWAY'S OINTMENT and PILLS.**—Health insured, soundness secured, ease, comfort, and longevity promoted. The benefits under disease from using these incomparable medicines are known to all who have given them a fair trial. They cannot be too highly commended for the favourable influence they exercise over the skin. In all eruptions, inflammations, ulcers, the detergent properties of his unguent render it so efficacious in first cleansing and purifying the diseased part, then inducing renewal and healthy action, as to ultimately leave the surface in the highest health. Holloway's Ointment works the most wonderfully beneficial results in bad legs, chronic sores, &c., by improving and quickening the sluggish and imperfect circulation, removing all corrupt matter, and increasing the disposition to heal.

*Nes' got it! — Nes' happy now!*

Tenders, endorsed "Tender for Trees," must be sent to the undersigned before November 10, 1888.

By order, KEIGHLEY WALTON, Town Clerk, Town Hall, Halifax, September 27, 1888.

**Borough of Penzance.**

**TO LANDSCAPE GARDENERS.**

**THE PENZANCE TOWN COUNCIL** invites TENDERS for Laying out a PUBLIC WORK and PLEASURE GROUNDS the Morrish House Property. A Report explanatory of the details of the plan and estimated cost must accompany each design. Premiums of Twenty and Ten Guineas will be given for the best and second best Designs respectively. Should the Author of the Premiated Plan be selected to carry out the work the Premium will merge in the Commission. The Premiated Plans to become the property of the Council. The Grounds to be laid out—4 acres in extent, and having throughout a southern slope—can be seen on application to the Borough Surveyor, from whom a Plan may be obtained on payment of £1, which will be returned to those forwarding designs.

Plans, &c., with distinguishing motto and name in sealed envelope, to be sent to me at my office, Public Buildings, on or before October 20 next.

THOS. CORNISH, Town Clerk.

Penzance, September 29, 1888.

23, Market Street (off Parliament Street), York.

**CLUES BROTHERS, SEEDSMEN, FLORISTS, & DUTCH BULB IMPORTERS.**

In succeeding to the business lately carried on by G. H. Hewson, at the above address, wish to intimate to his Customers and the Public generally that their intention is to supply everything connected with the trade of the purest quality and at the most reasonable prices, trusting thereby to merit the confidence and support so liberally accorded to their predecessor. The experience of W. CLUES (Manager), in some of the leading firms—viz.: Messrs. Downie, Laird & Laing, Florists to the Queen, Edinburgh and London; Messrs. Fisher, Holmes & Co., Sheffield; and Messrs. Edward Webb & Sons, the Queen's Seedsmen, Worsley, Stourbridge—will, we trust, be sufficient guarantee of his efficiency in the trade.—September 25, 1888.

Camellias, Azaleas, Rhododendrons, Palms, Orchids, &c. Plants grown specially for English use.

C. VUYLE, Esq., F.L.S., NURSERYMAN, Leamington, Warwickshire.

## SUTTON'S BULBS

GENUINE ONLY DIRECT FROM READING.

## HELLEBORUS NIGER, OR CHRISTMAS ROSES.

I can offer a magnificent lot of Christmas Roses, probably the  
finest lot in the Trade, especially of the H. niger major variety,  
which is the great favourite among market growers. These  
now offered are home-grown clumps full of flower-buds, and  
will be ready to lift in October; and I would advise early orders  
to secure them, as the stock of fine clumps is very limited.

### MAXIMUS.

A robust variety, the largest of the group, and very orna-  
mental as a foliage plant. If flowers in October and November,  
the blossoms are large and white, shaded with rose on the  
exterior, and generally produced in twos, but if shaded or a  
glass placed over the plants, the flowers are then pure white.  
By shading the flowers can be retarded even to December. It  
is the most vigorous of the section, and succeeds where many  
of the others fail to grow.

### MAJOR.

Although this plant is frequently offered, it is seldom to be  
obtained true to name, owing to its great value for cutting  
purposes. The flowers are pure white under glass, but have a  
slight rosy tinge in the open; it is the greatest favourite  
among market growers, producing flowers from December to  
January. It is a grand variety for potting, the foliage is so  
close and compact, and the flowers abundant.

### RUBRA.

One of the most distinct and novel of this group. The flowers  
are large, produced about the middle of January, and of a lovely  
colour. It is a robust grower, free blooming, and a decided  
acquisition for cutting.

### RIVERSTONI.

A fine distinct variety, somewhat in the way of H. maxima,  
but with smaller foliage, yet a strong robust variety. The  
flowers are produced in pairs, pure white, and blooming in the  
open at Christmas, a little earlier than major and later than  
maximus, thus forming a nice succession, and will be found a  
fine addition to our list of these useful winter-blooming plants.

### COLLECTED PLANTS.

These are far superior to the ordinary stuff generally offered,  
which are usually dried up and half dead before received,  
being collected by inexperienced men; those now offered are  
fine healthy plants, and usually are as fresh as when first  
lifted, and always do well.

Prices on application.

INVITES AN INSPECTION FROM INTENDING  
PLANTERS TO

## THE FOLLOWING TREES,

Having stout straight stems, fine heads, and  
splendid roots. All have been trans-  
planted within two years:—

ACACIA BESSONIANA, 12 to 14 feet.  
.. SEMPERFLORENS, 12 to 14 feet.  
ACER DASYCARPUM, 12 to 16 feet.  
.. WIERB LACINIATA, 10 to 14 feet.  
.. NEGUNDO VARIEGATA, Standards, 8 to 10 feet.  
.. LEOPOLDII, 12 to 14 feet.  
.. RETTENBACHII, 12 to 14 feet.  
.. SCHWEDLERII, 12 to 16 feet.  
.. WORLEYII, Standards, 12 to 14 feet.  
ASH, Mountain, 10 to 14 feet.  
BEECH, Common, 10 to 12 feet.  
.. Purple, Pyramids and Standards, 10 to 16 feet.  
BIRCH, Silver, 12 to 16 feet.  
CHESTNUT, Horse, 14 to 16 feet.  
.. Double White, 10 to 16 feet.  
.. Scarlet, 12 to 16 feet.  
.. Spanish, 12 feet.  
ELMS, English, 10 to 12 feet.  
.. Guernsey, 12 feet.  
LIMES, 12 to 16 and 20 feet.  
.. Silver-leaved, 10 to 14 feet.  
LIQUIDAMBAR, 6 to 10 feet.  
MAPLE, Norway, 12 to 16 feet.  
OAK, English, 10 to 14 feet.  
.. Scarlet American, 12 to 14 feet.  
PLANES, 12 to 16 feet.  
POPLAR, BOLLEANA, 10 to 16 feet.  
.. CANADENSIS NOVA (the true variety), 12 to 16 feet.  
SYCAMORE, Common, 14 to 16 feet.  
.. Purple, 14 to 16 feet.  
THORNS, Double Scarlet, 8 to 10 feet.  
.. White, 8 to 10 feet.  
WALNUTS, Common, 10 to 12 feet.

### Weeping Trees.

BEECH, Weeping, Pyramids and Standards, 8 to 12 feet.  
.. Weeping, Purple, Pyramids and Standards, 7 to 12 feet.  
BIRCH, Young's Weeping, Pyramids and Standards, 8 to 14 feet.  
ELMS, Weeping, Pyramids and Standards, 7 to 14 feet.  
LARCH, Weeping, Pyramids, 8 to 10 feet.  
OAK, Weeping, English, Standards, 10 to 12 feet.  
POPLAR, Weeping, Pyramids and Standards, 10 to 12 feet.  
SOPHORA JAPONICA PENDULA, Standards, 8 to 9 feet.

### Evergreens of large size, for immediate effect.

ABIES CANADENSIS (Hemlock Spruce), 5 to 8 feet.  
.. DOUGLASII, 5 to 10 feet.  
.. GLAUCA, 4 to 6 feet.  
CEDRUS ATLANTICA, 4 to 5 feet.  
.. GLAUCA, 3 to 7 feet.  
.. DEODARA, 6 to 10 feet.  
LIBANI (Cedar of Lebanon), 4 to 7 feet.  
CUPRESSUS LAWSONIANA ERETA VIRIDIS, 5 to 6 feet.  
.. LUTEA, 3 to 6 feet.  
JUNIPER, Golden Chinese, 3 to 8 feet.  
.. VIRGINIANA GLAUCA, 3 to 7 feet.  
PICEA CONCOLOR, 4 to 6 feet.  
.. GRANDIS, 4 to 9 feet.  
.. LASIOCARPA, 4 to 8 feet.  
.. MAGNIFICA, 2 to 4 feet.  
.. PUNGENS GLAUCA, 3 to 4 feet.  
PINUS AUSTRIACA, 3 to 6 feet.  
RETIKOPUS BOREALIS, 4 to 5 feet.  
.. VIRGINIANA GLAUCA, 3 to 4 feet.  
SPRUCE FIR, 4 to 5 feet.  
.. Black and White, 4 to 7 feet.  
THUIOPSIS BOREALIS, 4 to 5 feet.  
.. DOLABRATA, 3, 4, and 6 feet.  
THUIA LOBBII, 4 to 5 feet.  
.. OCCIDENTALIS.  
.. LUTEA (Golden), 3 to 6 feet.  
YEW, Common, 3, 4, and 5 feet, thousands.  
.. Golden, of all sizes, up to 10 feet.  
We have a large quantity of Pyramids, Globes, and  
Standards, in point of variety and size unequalled.  
.. Golden Seedlings, 3, 4, 5, to 8 feet.  
.. Irish, 5 to 10 feet.  
.. Golden, 3 to 5 feet.  
AUCUBA JAPONICA, 2½ to 4 feet.  
BAMBUSA METARPA, fine clump, 5 to 7 feet.  
BOX, Green and Variegated, 3, 4, 5, to 8 feet.  
HOLLIES, Common Green,  
.. Altaclearne,  
.. Hodgins,  
.. laurifolia,  
.. myrtifolia,  
.. Scuticaria,  
.. Yellow berried and other sorts,  
.. Variegated, of sorts,  
.. Golden Queen, 4, 5, 6, 7 to 10 feet, hundreds of beautiful  
specimens.  
.. Silver Queen, 4 to 10 feet.  
.. Weeping, Ferry's, on straight stems, with heads of ten  
to fifteen years growth.  
.. New Gold Weeping, a large quantity of beautiful plants.  
AZALEAS, the finest varieties known, 2, 3, 4, and 5 feet.  
.. MOLLISS, Seedlings and Named Varieties.  
RHODODENDRONS, 2, 3, 4, 5, 6, 8 to 10 feet, thousands of  
finer plants than can be found in any other Nursery.

The Rhododendrons and Azaleas in Rotten  
Row, and at the Royal Botanic Gardens, Regent's  
Park, are supplied by ANTHONY WATERER.

## EARLY ENGLISH GARDENING.

IV.

TO all those interested in the primitive phases  
of English gardening, there is no more valu-  
able book than Professor Thorold Rogers' *History  
of Agriculture and Prices in England*, a work  
which represents the study and research of over  
a quarter of a century, and of which six out of  
eight goodly volumes have already appeared.  
It commences with the year 1259 and will con-  
clude with 1793. Scattered throughout its pages  
are numerous items, directly bearing upon the  
gardening of the more remote ages of English  
history. The prices paid at different times for  
various commodities are exceedingly interesting  
and instructive. We learn, for example, that in  
1403 Mustard seed was sold at fifteen pence per  
bushel, but which in 1418—probably through some  
very unusual circumstance—was selling for 8s.  
for the like quantity. In the former year, also,  
Garlic was fetching 4d. per bunch, and Onions  
7d. per bushel. At about this time, also, the  
wages of an unskilled labourer were threepence  
and fourpence per day; whilst women, who were  
employed in the lighter agricultural works, such  
as weeding, received twopence per day. Again,  
in 1403, a pound of Saffron was sold for 16s. 4d.,  
of Cloves for 3s. 2d., of Currants sixpence, of  
Dates twopence, of Figs and Raisins and Rice  
one penny. The prices of all these foreign spices  
and fruits were, naturally, subjected to fluctuation,  
sometimes of a very erratic character. In 1503  
Saffron had fallen so low as 7s. per pound, in  
some places; whereas in others the price varied  
from 10s. to 12s. In 1502 Cloves were selling for  
2s. 6d., but in the year following 8s. per pound  
was the market value. Other commodities were  
selling at about the same prices in 1503 as in  
1403. It will, of course, be understood that these  
figures do not represent the currency of to-day;

to get at an approximate equivalent in our present coin the figures should be multiplied by six, or even eight.

The records whence Professor Rogers derived his data afford the interesting facts that 1*d.* per day was paid in 1326 for felling trees, and that 1*d.* was paid for the hoeing of an acre of land. Also, that in 1502 twenty trees for gardens were sold for 4*d.* at Oxford, but we are left to conjecture as to whether these trees were ornamental or fruit-bearing. In 1537 a garden spade was sold at Cambridge for 7*d.*, and there are several shovels mentioned in the records.

Professor Rogers is strongly inclined to believe, from the absence of proof to the contrary in his researches, that there was no such thing as horticulture until the last two decades of the sixteenth century. He advances some remarks of Hartlib's to the effect that English gardening was very backward, and that the better kinds of fruits and vegetables were imported from Holland, though the English soil and the English climate were quite adequate to supply what came from a foreign land.

We may take for granted that none but rich people indulged in the luxury of vegetables until the seventeenth century. The diet of previous times was "copious but coarse," and through several months of winter hundreds and thousands of people subsisted on salted meat. The fact is in many ways an interesting one. It shows, for example, that the almost universal predilection for vegetables is a comparatively recent one, that the strongly urged principles of vegetarianism are purely of modern growth, and that in many respects our scientific efforts to live longer are not, after all, much more conducive to that end than the "copious but coarse" curriculum of the Englishman of four or more centuries ago. It must be clearly understood that the present writer has no wish to disparage vegetarianism, but the fact or two indicated above could not but induce a reflection upon "some certain truths." "The familiar vegetables of our experience," writes the Professor (iv., 653), "were generally unknown up to nearly the end of the sixteenth century." Onions were, apparently, in common use. There are numerous entries of garden Peas, and a few of edible Beans. I have found one record of the purchase of Cabbage-seed. But garden roots, the Turnip, Parsnip, and Carrot, are, as far as my researches supply me with information, unknown, and remained unknown until, in the reign of James I., they were introduced from Holland. Potatoes came in at about the end of the sixteenth century, for I have found purchases made on the great Queen's account at two shillings and sixpence per pound. The only native flavours were a few wild plants."

It is perhaps of more importance to know when a particular vegetable was actually in commerce than the mere date of its introduction—which in many instances occurred first in a dried state. The following facts, therefore, are of considerable interest and importance. In 1593 a London merchant purchased seeds of certain pot-herbs, such as Hyssop, Thyme, Marjoram, and Winter Savory. There is a record of the New College, Oxford, buying, in 1644, Cabbage plants at 1*s.* per 100, Carrot seed at 4*d.* per ounce, and Turnip seed at 2*d.* per ounce. The first reference to Cauliflower is 1655. In 1663 the owner of Mount-hall, near Saffron Walden, is recorded to have bought seeds of Carrot, Radish, Cabbage, Lettuce, Parsnip, Spinach, Colewort, curled Radish, Succory, Cucumber, Skirret, Rounsfalls, Clove Gillyflowers, Gillyflowers, Clover, Saintoin, and Asparagus plants. In the follow-

ing year the same individual purchased, in addition to the foregoing, Striped Lettuce, Smooth Spinach, Parsley, Scurvy-grass, Leek, Purslane, Musk Million seeds, Cabbage plants, Artichoke plants, Sandwich Peas, Winter and Summer Savory, Sweet Marjoram, Short Cucumber, and Turnip seed.

There is yet another important phase of early gardening which finds place in Professor Rogers' valuable contributions to the history of British commerce; and that is in reference to gardeners' wages. We believe we are safe in saying that this subject has hitherto been wrapped in the most complete obscurity. The wages were low,—as low, in fact, as those of the ordinary labourer. At Oxford, in 1589 and 1591, 6*s.* per week was the amount paid; in 1599, and until two years later, the sum had dwindled down to 4*s.*; it rose to 5*s.* 4*d.* in 1602, only to fall back in 1609 to 5*s.*; and still further, in 1610, to 4*s.* All Souls' College gardener received 6*s.* per week in 1612 and in 1617, but he of the New College 1*s.* less in 1621. A certain Lord Spencer "beat the record" with his munificent allowance, in 1621, of 3*s.* The wages of gardeners in London appear to have been best, for in 1593 and 1595 7*s.* 9*d.* and 8*s.* were paid to those who worked in or near the metropolis. A movement for the better transpired at the end of the first quarter of the seventeenth century, when 9*s.* appear to have been the average weekly wage of a gardener. W. R.

## NEW OR NOTEWORTHY PLANTS.

**CATTELEYA GUATEMALENSIS** (T. Moore) VAR. **WISCHHUSENIANA**, n. var. (See T. Moore, *Floral Magazine*, 1861, pl. 61.)

The earliest record we have of this little known variety is to be found in Dr. Lindley's Herbarium. There are to be seen on the same sheet flowers of *Cattleya Skinneri guatemalensis*, and of *Barkeria Skinneri*, with the remark—"All from one stock; *Guatemala, Skinner*."

The plant was exhibited by Messrs. J. Veitch in March, 1861, as coming from Mr. Skinner. It has the bulbs nearly like those of *Cattleya Skinneri*, or *Epidendrum aurantiacum*, a rather well-developed acute spathe, and a corymboid raceme with flowers as large as those of *Cattleya Skinneri*, sepals and petals more acute, and an oblong acute lip, rather obscurely trilobed in the middle, with blunt angles, convolute at the superior half, showing then a yellow basilar disc, with some radiating series of dark blackish-purple spots, purple around, and at the apical part. The sepals and petals are light yellow, with light purple margins. Later on I had just the same form from my late friend, Mr. John G. Veitch, who imported it from Panama, and from Lord Londesborough's collection near Combe Wood, in April, 1873. Both have the yellow disc of the lip. I find a memorandum with the last, declaring it a hybrid between *Epidendrum aurantiacum* and *Cattleya Skinneri*, it having been collected among the two species. This is a very good suggestion, which I prefer by far to Mr. Skinner's first-mentioned statement.

Finally, Mr. B. S. Williams has favoured me with an inflorescence and a photograph of the plant prepared by Messrs. H. Johnson & Co., of Wood Green, N. The flowers have very light reddish-purple sepals, rose-purple petals, and a brown lip without a yellow disc, but at the very base with a small white place. Column white. The lip is not so distinctly lobed, but rhomboid or oblong-acute. It flowered with Mr. W. Wischhusen, whose name it bears, and who sent flowers and a photograph to Mr. B. S. Williams, who kindly favoured me with them.

I have to thank Mr. F. Sander for a copy of the plate quoted, and Mr. J. Godeff for information from the description, obtained through Mr. Nicholson at Kew Gardens. H. G. Rehb. f.

**ODONTOGLOSSUM ANDERSONIANUM** LOBATUM VAR. **LEMOINIERIANUM**.

This is an unusually fine variety (individual?) Its flowers are very large. The sepals and petals are bordered with fine yellow. There is some yellow on the base of the unbordered lip. A very light mauve hue spreads over the white disc of two of the sepals.

It was kindly sent me by Mr. A. Lemoinei, of Lille, who raised that showy *Cypripedium* so much admired at the Exhibition at Ghent. H. G. Rehb. f.

**CATTELEYA GUTTATA** LEOPOLDI ODORATISSIMA, n. var.

This is very near the fine *Cattleya guttata* Leopoldi immaculata, which appeared in 1886 with Mr. A. A. Peeters of St. Gilles, Bruxelles. The petals and sepals are yellow on both sides. The side lacinia of the lip are white, its disc and anterior lacinia purple. Column very strong, purple at the top and a little at the base. The remaining part white. There is an angle on each basilar side in front of the column, which is remarkable. "The plant is not distinct from the others in growth. As soon, however, as a ray of sun shines on the plant the whole house (25 metres in length) is fully perfumed by a delicious smell of Heliotrope, from five flowers only." This is what Mr. A. A. Peeters writes me about this very remarkable novelty. H. G. Rehb. f.

**ONCIDIUM MACULATUM** (Lindl.) PSITTACINUM, Rehb. f., in Lindl., *Folia Orchid.* *Oncidium*, pl. 113 (1855).

This lovely variety was kindly sent by Mr. Alfred van Immschoot, from Mont St. Amand, Gand. All the ground colour of the sepals, petals, and lip is of the finest yellow; sepals and petals much blotched. Having named it as early as 1855, I felt very pleased to see it again after thirty-three years. H. G. Rehb. f.

**CATTELEYA GUTTATA** MUNDA, n. var.

*Cattleya guttata* Leopoldi immaculata is for the Leopoldi variety what this is for the old typical Lindleyan *Cattleya guttata*. It has both sepals nearly green, without any spots. The lip and the column are like those of the old plant. I should have liked to name it in allusion to its green colours, but, as so frequently happens, the colour eventually changed to a light yellow. Messrs. Seeger & Tropp kindly sent it to me. H. G. Rehb. f.

**ÆRIDES HOULETIANUM**, Rehb. f.

Mr. Ortgies, the Curator of the Zurich Botanic Gardens, kindly sends me a splendid inflorescence and leaf of what he received from Paris as *Ærides Picotianum*. There is no difference between the two, excepting the priority of the name of *Ærides Houletianum*. H. G. Rehb. f.

## ROSES.

### A PLEA FOR TEA AND NOISSETTE ROSES.

As the period of the year is now at hand when lovers of a garden will be considering what alterations shall be made, and what additions indulged in, and as all gardeners are lovers of Roses, I make no apology for putting in a plea for two classes of Roses (running very often into one another) which have greatly increased in popularity of late years, about which erroneous notions have prevailed, and concerning whose beauty there cannot be, I think, a second opinion.

Amongst the errors which have prevailed concerning them is their great delicacy of constitution, and this is a fallacy. Of course, we all can remember the time when Tea Roses would die off, but that was not in all cases the fault of the Rose so much as of the stock it was budded on. There were, it is true, delicately constitutioned Roses in those days, such as *Vicomtesse de Gazez*, *La Boule d'Or*, *Madame de St. Joseph*, *Monsieur Furtado*, and when these died off it was concluded it was owing to their weakly constitution, but other and

stronger ones did the same, and the cause was not far to seek. Except on standards and half-standards, when the wild Brier was used, all Roses, Tea and hybrid perpetual alike, were budded on the Manetti. Now this stock has many advantages for hybrids on some soils, and for nurserymen it is invaluable; it is easily worked, and strikes from cuttings most readily, but it has two disadvantages for Teas—it is very strong, full of vigorous sap, and is apt to assert its position rather too much; moreover, it is very precocious. The sap rises early in the season, pushing the scion into growth, and exposing the shoots to the attacks of those May frosts which are so injurious to the well being of many things, but especially to that of the Rose. The introduction of the seedling Brier as a stock by Mr. George Prince, of Oxford, and the use of the tree cutting, very warmly advocated by Mr. Ben. Cant, of Colchester, have changed the whole character of Tea Rose growing. We get stocks more suited to the growth of the scion, and which do not push so early in spring, and do not expose their foster-children to the rude embraces of King Frost.

There are, I am aware, districts where the growing of Tea Roses is a difficulty owing to climate, and some of our midland and northern counties are the worst off in this respect. It does not follow that the further north one goes the greater the difficulty there is in growing Teas. Some of the best plants of Teas I have ever seen were some of Messrs. Cocker & Son's, of Aberdeen; and I have had blooms sent to me by a lady correspondent at Christmas time, from Forres, which bore witness to a fine climate; while my friend, Mr. A. Hill-Gray, has shown how he could grow Tea Roses in the Perthshire Highlands; and I have seen in the south-west of Scotland plants which it was impossible to exceed in vigour and beauty; still I know there are many places where it is a difficult, if not an impossible, matter to grow Teas. These are mostly in the north midland counties, which boast of some of the coldest spots in these islands. I would, however, say to all who love the Rose, Don't determine you can't grow Teas until you've tried.

In making a selection of Roses in these days, I would first of all bear in mind that the beginner (and I am not writing for experienced growers) requires Roses that will grow. There are so many vigorous growers now-a-days, of all shades of colour, that a good selection of them will give a grower all that he can desire, even when eliminating some, which, although vigorous, are, from some cause or other, not effective; thus, *Riza du Parc*, although of a very taking colour, and vigorous in habit, yet has the bad habit of throwing malformed flowers, so that not one in fifty comes as it ought to do. Then there is *Jean Ducher*, which, although very beautiful, is a fair-weather Rose, and in wet seasons you will in vain look for a good bloom. Then, again, *Marie Guillot*, although a very fine Rose, is too difficult to open, and it is of no use beginners worrying themselves, and reaping disappointment. Let me advise then the following:—*Anna Olivier*, a beautifully shaped flower, flesh-coloured, with a deeper tinge at the base; *Caroline Kuster*, bright lemon-yellow—a very good Rose; *Catharine Mermet*, a lovely flesh-coloured Rose, of fine form, and one of the very best. I may add here to it her offspring, *The Bride*, which is, if possible, more lovely than her parents, a beautifully pure white. *Etoile de Lyon*, bright sulphur-yellow, perfect in form and vigorous in habit; *Hon. Edith Gifford*, white, slightly tinted with delicate flesh colour, very like our old English Rose *Deveniensis*, but better in habit, and altogether a most desirable Rose. *Madame Cusin*, rosy-purple with yellow base; *Madame Lambert*, one of the most protean Roses I know—you can never tell what colour it will be, sometimes bright rose, sometimes yellow, and at other times of all shades of the two combined: generally it comes darkest in autumn. *Madame de Watteville*, very distinct, pale lemon, with distinct margin of pinkish rose, a great improvement on *Homère*. *Marie van Houtte*, probably the most vigorous of all Teas,

yellowish-white, edges of the petals margined with rose, and a wonderful combination of the two colours. It is very vigorous, very fine, and a grand autumnal bloomer. The petals have not the solidity of some other Teas, and occasionally the flowers are loose. *Perle des Jardins*, very large, full, and well formed, bright straw, passing into deep canary; *Rubens*, large flower, white, with yellowish centre; *Souvenir de Paul Neron*, beautiful white, with a very delicate tinge of rose in the centre; *Souvenir de Thérèse Levet*, deep rosy-crimson, the darkest Tea in growth; *Souvenir d'un Ami*, salmon and rose shaded, large and full; *Sunset*, an orange-coloured sport from *Perle des Jardins*.

For pillar or climbing Roses there are no better Roses than the *Noisettes*, especially those of the *Gloire de Dijon* race. "Old Glory" is very fine, but I think some of her progeny even better—*Bouquet d'Or*, for example, while very vigorous and beautiful in flower, is also better covered with foliage. *Madame Berard*, a deeper shade than *Gloire*, is also a freer bloomer in autumn. *Madame Emilie Dupuy* is a pale form of *Gloire*, while *Madame Eugene Verdier*, deep chamois-yellow, good in shape, is also a fine autumn bloomer. To these I would add *Rêve d'Or*, which comes between the Teas and *Noisettes*, and is a most beautiful flower—a climbing *Madame Falcot*. These are all good Roses for concealing fences, walls of houses, or training as pillar Roses. *Wild Rose*.

## FRUIT REGISTER.

### PEAR CLAPP'S FAVOURITE.

This early Pear, which is of American origin, is not mentioned in the report of the Pear Congress held at Chiswick, as suited to the Southern Counties. That it is a variety for the South of England can be seen in the nurseries of Messrs. J. Cheal & Son, at Crawley. It is of medium size, handsome in shape, rather higher in colour than *Louise Bonne de Jersey*, and it does well either on the Quince or the Pear stock, growing and cropping freely. It will take a place amongst early market Pears, coming in just before Williams' *Bon Chrétien*. *R. D.*

### THE WILSON JUNIOR BLACKBERRY.

There are two long rows of this Blackberry in the gardens of Mrs. Clay, Comyn Hill, Iffracombe. The rows run north and south, are 4 feet apart, the canes being trained at from 6 to 9 inches apart, to a series of wires strained to stout posts, and are bearing heavy crops of large conical shaped fruits which are nearly three times the size of the ordinary Blackberry, and about three weeks earlier than it in ripening. The fruit of the Wilson Junior possesses a pleasant sub-acid flavour. The soil at Comyn Hill is yellow loam, from 12 to 15 inches deep, the situation high, and the air bracing. The combined effect of these favourable conditions is very marked, not only in the subject of this communication, but especially so in the growth of shrubs, flowering and otherwise, in the gardens at Comyn Hill, the keep of which reflects credit on Mr. John Dodds, the head gardener there.

### DIAMOND PLUM.

This is a good grower, and a very free-bearing kitchen Plum. The fruit, of a rich dark purple colour, is large, globular, and handsome. In ordinary seasons it ripens early in September, but this exceptionally wet and cold season it is, like all other kinds and varieties of fruits, a couple of weeks later than usual in ripening. This excellent variety should be included in every collection of Plums.

### COLUMBIA AND APRICOT PLUMS.

Considering the excellent quality of these two golden round Plums, the wonder is that they are not more extensively grown than they appear to be. During ordinarily warm summers they ripen by the end of August. The fruit attains to a good size, is

very juicy, and of excellent flavour. The trees, too, are good growers and pretty free bearers.

### VICTORIA AND POND'S SEEDLING PLUMS.

These red egg-shaped Plums are two of the aurore croppers and best all-round kitchen Plums that I am acquainted with. During the last seventeen years I have not known them to miss bearing a heavy crop of fruit. From two to half-a-dozen trees each of the above-named varieties, according to circumstances, should be in every collection of Plums. They are both capital varieties for bottling in syrup for use during the winter months. The trees, too, are of good constitution, and, owing to the immense crops of fruit which they annually bear, they make a short-jointed growth every year. *H. W. Ward*.

## THE COPENHAGEN FUNGUS EXHIBITION, 1888.

"Do the Copenhagen Exhibition" is an easy enough command to be issued from the editorial sanctum, but the special mycological correspondent of the *Gardeners' Chronicle* had many misgivings before he put pen to paper to write an account of the Danish fungus show of 1888. He did the Paris show last year, and got into terrible hot water for his pains. He had then the audacity to suppose it possible for the French mycologists to be able to correct certain errors into which their English colleagues had fallen; but, alas! how wrong he was! The fierce storm of criticism which fell upon his devoted head was something never to be forgotten. He would at once take leave, therefore, to say, that "We English know everything that there is to know about fungi," but to add, *sotto voce*, "at least, some of us think we do." Some of our British mycologists have never been really happy since the account of the Paris show appeared in the columns of the *Gardeners' Chronicle* twelve months ago. They have during the past year spent their days in striving to make our *Agaricus russula* into two species, and their nights in terror lest *Russula delica* should, after all, have a tinge of green on its gills.

How the Editor of the *Gardeners' Chronicle* should have known that a fungus exhibition was to be held this year in Copenhagen is one of those inscrutable mysteries which can never be solved [We dissent, Ed.]; but the fact is, that his special correspondent found himself in the capital of Denmark in due course, with his battered vasculum in one hand and his portmanteau in the other. On his arrival the first thing which perplexed him was that there were two exhibitions going on simultaneously—a minor one, known only to the general public as the "Den nordiske Industri-, Landbrugs- og kunststudstilling," and the important one of fungi at the Botanic Gardens. The latter began by an excursion on Sunday, September 23, under the direction of Dr. E. Rostrup, to Gelskov. The party had a pleasant day, returning in the afternoon laden with spoil for the exhibition. Their finds included, *inter alia*, *Peziza bulbosa*, *A. rametaceae*, and *Clavaria pistillaris*.

On Monday morning a start was made at 8 a.m. for the grand Beech woods at Frederiksdal; the party included a Swedish botanist from Upsala, and a small Dane, who carried two immense baskets. The latter were in due time filled to overflowing. The species collected included fine specimens of *Strobilomyces strobilaceus*, *Lactarius pigramus*, *Clavaria botrytis*, *Boletus felleus*, *Phallus caninus*, and *Peziza succosa*. Under some Spruce Fir were found *Marasmius perforans*, *Hygrophorus agathosmus*, and *Telephora palmata*. An exceedingly beautiful *Polyporus* was found on a stump; to the writer it recalled the *P. croceus* he saw at Paris last year, but as a portion was sent to Dr. Robert Fries, of Göttingen, we shall, in due course, authoritatively know its name (Dr. Fries has since reported it to be *P. croceus*). Not a single specimen of *Faxillus involutus* was seen all day, but thousands of *P. atro-tomentosus* were observed; this will show how the fungus-flora of the two countries, Denmark and England, differs.

On returning to Copenhagen in the afternoon the work of naming and arranging the specimens was found to be in progress by Mr. Petersen and Professor Warming with great vigour. What aid your special could give, of course, was given, but the lion's share was done by the Danish mycologists. In the collection a number of specimens appeared from Dr. Robert Fries, from Sweden; these included *A. depilatus*, *decorus*, *icterinus*, *rossellus*, *pseudodatus*, and *caperatus*; *Lactarius helvus*, and *Cortinarius brunneus*. On the tables were also *Peziza notica*, *leporina corium*, *Geoglossum glabrum*; *Boletus radicans*, *Agaricus porphyreus*, *murinaceus*, and a host of others. The specimens were neatly arranged on white plates, with their names, in their proper botanical sequence; on side tables were collections of edible and poisonous species. Around the room was a large number of specimens of rare species, preserved in spirits, such as *Hydnum coralloides*, *erinaecium*, *Morchella*, *Gyromitra*, &c. There was also a collection of parasitic fungi in the recent state, and, what was of special interest, the unique collection of *Gymnosporangia* and *Rostelia*, of classical interest, from having been made by the late Professor Oersted.

On Wednesday (September 26) an excursion was made to Klampenborg, where the Beech forest produced again *Strobilomyces strobilaceus* in fine condition, the rare *Lactarius volemus*, and the exquisite *A. eucorus*, as usual, on an Alder stump. High upon a Beech tree, far above our reach, was observed a splendid cluster of *A. aurivellus*, a common Danish, but a rare British species, and one with which the writer was particularly anxious to become acquainted. The persistent endeavours to displace the fungus by hurling sticks and stones at it by Mr. Rostrup, jun., were at length rewarded with success, greatly to the delight of your special.

In the afternoon time was found to visit the minor exhibition, where a collection of diseased plants and trees made by Dr. E. Rostrup was the centre of attraction.

The last day of these pleasant meetings always comes too soon. This was spent at Ruderhøj, with Dr. E. Rostrup and his son; there we were shown living and dying specimens of trees, principally *Firs*, *Pinus sylvestris* injured by *Cœma pinitoquum*. P. Strobilus, killed by *Peridermium pini*; the ravages of *Peziza Wilkommii* on young Larches; of *Agaricus melleus* and *Polyporus annosus* on other trees. These with the ravages of *Hypodermia microsporum*, *Lophodermium brachysporium*, *Melampsora pallida*, *Sphaeria imbricata*, and a host of other parasites, greatly interested, even if they somewhat confused your special. Amongst the large fungi *Boletus felleus*, *Hygrophorus caprinus*, and *Agaricus bufonius* were gathered.

Later in the day the writer dined at the house of Mr. J. L. Jensen with Dr. and Mr. Rostrup; the evening was spent most agreeably in the interchange of views and the discussion of mycological problems; he retired late, to dream of Svampe, of Hexenbesen, of Heterocism, and of High-moulding.

It need not be added that the whole visit was most enjoyable, the kindness and courtesy with which the writer was received by his Danish friends was extreme, the weather was magnificent and fungi plentiful: what more could one have wished! Charles B. Plowright.

## THE COLOUR OF GRAPES.

In an exhaustive treatise by Messrs. Thudicum and Dupré upon wine, the colouring matter of the skins of Grapes is more or less studied. The authors say that the juice of most Grapes is perfectly free from tannin; the skin and stalks however, contain a considerable quantity of a substance which, though not ordinary tannin, closely resembles it in its properties. It is also asserted that the colour in wine from Grapes is produced by the oxidising effect of the air upon matters contained in the fruit—the so-called extractive, or bodies not yet known, and the tannic acid. From this circum-

stance we learn that colour is the effect of sunlight acting upon the tannic acid of the skins, and upon unknown bodies, that play so important a part in the colours of wine.

Mr. D. S. Marvin, of New York, considers there are causes outside of any chemical action and reaction that have led up to and originated the colour of the Grape. For instance, the influences of birds, and occasionally animals, the interchanges of action and reaction they have produced upon the slow and gradual development of the fruit. He says:—"It is as yet unknown from what plant the Grape originated, but from a careful study and personal consideration of the varied tendencies of the plant, the seedlings gradually diverging and, finally, breaking in such a number of species far away in the past, and each of these species again into such a multitude of varieties, the varieties sporting into so many new tints and colours of skin and pulps and seeds; we must, therefore, conclude that these causes have exerted such an important influence upon some one or more of the vital economics, that the colour of the fruit had come to be of very great importance to the development, growth, and welfare of the plants themselves.

The writer adds:—"In some varieties of Grapes, like the Concord, for instance, there is little or no colouring pigment in the pulp, the colouring matter, as is supposed from its herein suggested origin, residing in the skin. There are other varieties—those of which port wines are made—in which the pigments have spread from the skins into the pulp, and even the seeds are dark in most of the Riparia Grapes. John J. Willis.

## PTEROCARYA FRAXINIFOLIA.

It is so seldom in this country that we see produced the female catkins of this tree that we gladly avail ourselves of specimens forwarded to us from Devonshire by Sir John Walrond. The tree is a native of the Caucasus, never attaining any great height, but one which, from its bold Walnut-like foliage, is deserving of cultivation. The leaves are from 6—10 inches in length, and bear from seven to twelve oblong serrated leaflets. In autumn the leaves assume a clear lemon-yellow colour. The male flowers are borne in short sessile catkins, while the female catkins, as may be seen from our illustration (fig. 52), are pendulous elongate, reaching in the specimens sent us from 12 to 15 inches in length, the nuts provided on each side with a roundish or oblong membranous wing. The plant is nearly allied to the Walnut, and has the same curious stalked buds, but the nuts offer no attractions, save to the eye. The tree is also known as *P. caucasica*.

## THE VICTORIA REGIA IN THE OPEN AIR.

The plant in question was raised from a seed sown under glass January 13, 1888. Until the seed germinated (which was about February 1) the temperature of the water was kept steadily at 90°, after that time a uniform temperature of 85° was maintained. By May 5 the plant had made rapid progress, having leaves at that time 4 feet in diameter. It was then decided that the plant should be placed in its summer quarters—a large pond 30 feet wide and 2½ feet deep, artificially heated from the greenhouse. Good rich soil to a depth of 12 inches was wheeled in, and the plant carefully planted in the centre, care being taken to first well warm both soil and water.

As the mean temperature of the month of May in this latitude is much too low for any plant of a tropical nature, some protection for this Lily was necessary for the first few weeks; this was given in the shape of a thin cotton cloth rolled down over the pond, the framework to support the cloth consisting of stout galvanised iron wires stretched from side to side.

By heating the water in the pond to 90° sufficient heat was thrown off to well warm the volume of air under the cloth, and no difficulty was experienced in

maintaining a temperature of 65° or 70°, when it was much more severe outside. Since warm weather set in we have dispensed with the cloth except on windy days, which, by the way, are very numerous on Cape Cod, and are by far the worst enemy we have to contend with in growing the Victoria Regia.

When once established in its new quarters the leaves rapidly increased in size until they reached a diameter of 6 feet; and June 17, five months and four days after sowing the seed, the first flower opened. From that date until the present time, July 9, it has flowered every third or fourth night. The flowers are from 10 to 12 inches in diameter, and of a beautiful creamy-white colour the first night, while opening on the afternoon of the second day they rapidly change to a deep pink, and soon start on their downward journey to the bottom of the pond.

Since flowering no increase in size of leaf has been observed, rather otherwise; still considerable gain is made in the size of the plant, which is now 23 feet in diameter, and still increasing. James Brydson, in the "American Florist."

## NURSERY NOTES.

### ORCHIDS IN MESSRS. VEITCH'S NURSERY, CHELSEA.

SINCE visiting this nursery a few months ago I find that nearly the whole of the older Orchid-houses have been swept away, and have been replaced with new ones, and others are in course of construction. A large house has been erected at the north end of the new Cattleya-house, and is intended for flowering Orchids, on what may be termed the natural system. The house has been tastefully arranged as a rock garden with Matlock Bath stone, with an arrangement of rock in the centre down which water trickles when it is thought desirable. Ferns are planted in crevices and pockets in the rocks; the Orchids themselves are not turned out of the pots, but are placed in certain positions when they are in flower. This of course is the only way in which the house can be kept gay with Orchids all the year round. When a plant has passed out of flower it can be at once removed to the house again to make its growth; whereas, if allowed to remain amongst the Ferns and other foliage plants, it might not make a flowering growth at all. This artistic arrangement of Orchids in hothouses is not quite a new idea. It is nearly fifty years since Mr. J. D. Llewellyn, of Penllergare, constructed what he called an epiphyte-house on this system. Mr. Llewellyn obtained his idea first from reading Schomburgk's description of the waterfalls of Berberice and Essequibo, on the occasion of his first discovery of *Huntleya violacea*. He says, "I was delighted with the beautiful picture which his words convey, and thought that it might be better represented than is usual in the stoves of this country." An arrangement of rockwork was planned, with warmed water falling over a cascade, and the Orchids grew remarkably well in the moist atmosphere caused by the spray falling over the artificial rock. A drawing of the house after the plants were arranged and growing is given in the first volume of the *Journal of the Royal Horticultural Society* (1846). The house, I believe, still remains at Penllergare. In those days the number of Orchids available was not so great as now; and it will be easy for Messrs. Veitch, with their fine collection of these plants, to keep up the gay appearance of their house all the year round. At present the stately forms of *Cattleya maxima*, *C. bicolor*, *C. Harrisoni*, *C. Bowringiana*, and the lovely *Lælia elegans* may be seen rising above the Ferns and other plants; and overhanging the rocks, and suspended from the roof, are examples of *Cattleya pumila*; and graceful plants, such as *Oncidium Jonesianum*, and the golden *O. varicosum*. A good specimen, well-flowered, of *Pholidotis imbricata* stood on a ledge of rock; it is an interesting species, but not very striking in appearance. In the other houses many species and

FIG. 52.—PTEROCARYA FRAXINIFOLIA: LOW TREE HARDY FOLIAGE AND NUTS. (SEE P. 380.)

varieties were observed in flower. The *Odontoglossum-house* is well-furnished, and in the warmer houses is seen a greater wealth of bloom. *Cynoches chlorochilum* is a very robust plant, and of it there were some strong spikes; the yellowish-green flowers are not very showy, but their peculiar formation produces a novel effect.

Several racemes of the lovely purple flowers of *Barkeria Lindleyana* were observed; *Epidendrum Brassavola* was freely in flower; its large, peculiar-coloured flowers, have a distinct and handsome appearance. A fine dark-coloured form of *Odontoglossum Harryanum* was in flower, and I noted a large specimen of *Oncidium microchilum*, which had an immense spike of flowers. This is a species very seldom seen in cultivation, although it was introduced from Guatemala so long ago as 1838. The sepals and petals are of a yellowish-green ground colour, heavily blotched with brown; the lip is crimson, with a prominent white wing on each side.

Another uncommon Orchid in flower was *Geodorum candidum*, which is very pretty; the flowers are produced in a cluster at the top of the stem, and are of greenish-white colour, the lip being of a reddish-brown tint. Several species of *Phalaenopsis* were in flower, many species of *Dendrobium*, and *Cypripedium*. Numbers of the choice Chelsea hybrids of the last-named are to be seen in flower throughout the year. Some of the best at the present time are *C. grande*, *C. selligerum*, *C. cennanthum superbum*, *C. albo-purpureum*, *C. vexillarium*, a dark form of *C. Harrisianum*, &c. The very remarkable *Lælia Novelty*, described recently in these columns, was finely in flower. It is a garden hybrid raised by crossing *Lælia elegans* with *Cattleya pumila* and, as usual, is intermediate in general characteristics between the two species. The sepals and petals are twisted, and of a light rosy-purple colour; lip maroon-purple, shading off to paler purple at the margin.

*Cattleya porphyroplebia* × is also in flower in variety, it is a Chelsea hybrid also, produced by crossing *C. intermedia* with *C. superba*. The flowers are of a large size; sepals and petals clear pale lilac-rose, lip purplish, the throat cream-coloured, with purplish streaks in the centre. *J. D.*

#### A MIDDLESEX FRUIT-NURSERY.

In view of the approaching National Apple and Pear Conference at the Royal Horticultural Society's Gardens, Chiswick, the record of visits to some of our leading fruit nurseries may be of interest. We have already alluded to that of Mr. Bunyard, at Maidstone, and in due course we shall speak of others.

We now give some account of the well-known fruit nurseries of Messrs. Charles Lee & Son, situated in the parish next to Chiswick.

An inspection of the fruit quarters in the nursery under notice would almost dispel the prevalent idea (unfortunately too true with respect to many horticultural matters) that we have passed through such a dismal summer(?) season. The opinion of Mr. George Cannon (the able manager here) as to the effect of the season, in his own immediate locality, may be summed up as follows:—There is a good crop of Plums and Cherries of all sorts, also of Pears, but many of the latter are cracked, and will not develop their normal size. Apples are a thin crop, and the fruits will be below the average size. Peaches, Nectarines, and Apricots are a thin crop—in some places quite a failure—and will be late and below their usual size. The partial failure of the Apple crop was almost, if not entirely, owing to the continuance of cold, rainy weather during the time they were in bloom. Pears and Plums were set in bright, dry weather before the Apple blossom had developed.

The soil of Ealing is of a loamy nature, in most parts resting upon gravel, some portions deep loam with heavy loamy clay subsoil, rather late, not being so warm as some of its southern neighbours, such as Chiswick. It is, however, well suited to the cultiva-

tion of fruit trees and Roses. Attention should be given to the draining of the heavy soils—an important point. The soil of this nursery is a good deep loam, in every way suited to the cultivation of fruit trees and Roses, as is to be seen in the healthy condition of the stock growing in it.

On entering by the middle walk we come upon a fine quantity of pyramid Apples, three to four years old, worked upon English Paradise stock, many sorts bearing in a remarkably free manner, the following being the most noteworthy:—Lord Suffield, that truly never failing sort, the largest and earliest Apple that goes into market; it bears well on almost any kind of soil, but prefers a warm loam to keep the tree healthy and to have fine clear fruit. These remarks may also be applied to such sorts as Cox's Orange, Duchess of Oldenburg, American Mother, Melon Apple, and Northern Spy. A few of our best dessert sorts delight in warm gravelly or sandy loam, while some of the large culinary sorts, such as Wellington, Ecklinville Seedling, Warner's King, Blenheim, Northern Greening, and Alfriston, are not so fastidious as to soil; they like a good heavy loam. To refer again to Stirling Castle—twenty years' experience of this Apple with Mr. Cannon has taught him that it is a tree that wants all the nourishment it can get—liberal top-dressings—and then in the form of bush trees it will produce fruit nearly as fine as Blenheims. We counted on one small tree thirty of its fine fruits! Continuing sorts noted, may be mentioned King of the Pippins, Cox's Orange Pippin, Cox's Pomona, Cellini, Annie Elizabeth, Lord Derby, Potts' Seedling (what a fine sort!), Dutch Mignonne, Ecklinville Seedling, Frogmore Prolific, Winter Hawthornden, Lord Grosvenor, Manx Codlin, Warner's King, and Stirling Castle. Frogmore Prolific and Potts' Seedling should be noted as never failing croppers, and deserve to be more largely planted than is at present the case. These excellent cookers are held in high esteem at Ealing. A late-keeping free-bearing sort is Winter Hawthornden. Many newly introduced sorts seem to lack keeping qualities, with the exception of Lane's Prince Albert (excellent here), Bramley's Seedling, &c. So many sorts of Apples coming into use in the autumn at one time enhances the valuable qualities of Winter Hawthornden. Another good keeper is Northern Greening—it is especially valuable on account of its keeping good until March. Worcester Pearmain, that brilliantly coloured Apple, was well represented. Another good coloured Apple is Scarlet Pearmain. What a handsome and fine-bearing sort is Warner's King! Lady Henniker may also well be classed amongst the handsome Apples. Ecklinville Seedling, that fine Apple, always bears well here. Dutch Mignonne is a splendid sort, and is a good keeper: Peasgood's Nonsuch was observed in good condition; Lord Derby, very large; Cox's Pomona, highly coloured; Sturmer Pippin, good late sort: Ribston Pippin, light crop; Lord Grosvenor, very free.

We noticed thousands of Apple stocks worked this season with all the popular and new sorts, such as Lady Sudeley, Bismarck, The Queen, Sandringham, Brown's Codlin, Bramley's Seedling, Baumann's Red Winter Reinette, Gascoigne's Scarlet Seedling, &c. Near to the pyramid Apples are a quantity of cordon Apples on Paradise stocks, bearing good crops of the sorts already referred to. We noted a few good fruit of Peasgood's Nonsuch; near to this fine new sort is the old Nonsuch, very like the first-named, but much smaller, the abundance of its fruits making up for the size of the former.

As we journeyed through the various quarters we were struck with the very large stock of standard Apples grown, having clear stems and good heads, of such sorts as Lord Suffield, Lane's Prince Albert, Worcester Pearmain, Mr. Gladstone, Frogmore Prolific, Ecklinville Seedling, Keswick Codlin, King of the Pippins, Cellini, Potts' Seedling, Golden Noble, Warner's King, Hawwell Souring, Irish Peach and Blenheim Orange.

Mr. Cannon regards Blenheim Orange as the best Apple to plant for orchard, especially where the ground is heavy. To those having capital, and

who can therefore afford to wait, this is the Apple to plant. It does not begin to fruit for six or seven years after planting; by that time the tree attains large size, and commences to bear fine fruit which (desirable qualification to the grower!) fill the bushel, and always command, no matter how much the market may be glutted, a high price. It bears well, and so makes up for lost time. Even in old age this fine Apple is to be found doing well—an instance of which we recorded recently of a tree 50 years old, bearing 9 bushels of fruit.

Pears are fruiting best here on the Quince stock. Care is taken only to work such kinds as do best on it. A good many sorts, especially late ones, fail to grow on this stock unless double worked. Attention is given to this operation in order to include some of our best Pears on this stock.

Standard Pears are largely grown, also a considerable quantity of pyramids on Pears. On these and horizontals we noticed some good fruits of *Souvenir du Congrès*, *Williams' Bon Chrétien*, *Burré Capiaumont*, *Burré Clairgean*, *Burré Diel*, &c. Of other desirable kinds that we noted as doing well may be mentioned:—*Louise Bonne de Jersey*, *Marie Louise d'Uccle*, *Marvellous*, *Pitmaston Duchess*, *Fondante d'Automne*, *Belle Julie*, *Forelle*, or the *Trout Pear*, *Bergamotte d'Esperen*, &c.

Amongst miscellaneous fruits worthy of note may be recorded the fine collection of Peaches and Nectarines—a noteworthy feature here. Very close personal attention is given to these, every sort is studied as to the best stocks upon which to work them. Several thousands of fine trees are grown. We noted a lot of good extra-sized trees with from twenty to thirty shoots, and although the season has not been one of the best for even growth, we certainly never saw them so fine at Ealing before. The same may be said of the standard, half-standard, and trained trees. The last fortnight's fine weather has done much to ripen the wood. There is evidently special attention given to this stock. Standard Plums are plentiful, especially of such sorts as *Victoria*, *Black Diamond*, *Gisborne's*, *Pond's* Seedling, that largest of Plums; *Orleans*, *Prince of Wales*, and *Early Prolific*. Some of the pyramids are also bearing well. *McLaughlin's* *Gage* is regarded here as a fine early *Gage*, larger and earlier than the old *Green Gage*, very richly flavoured. A large stock is being worked up of *The Char*, one of Mr. Rivers' seedlings. This Plum is an immense bearer, large, red, culinary, coming in at the end of July; therefore a variety to be looked after, and well suited to market growers to fill the void between *Early Prolific* and *Victoria*. We noted a fine breadth—quite a thicket, in fact—of that popular market *Damson*, *Crittenden Cluster*—very fine stock.

#### THE FLORAL NURSERY, MAIDENHEAD.

Mr. Owen is one of the few nurserymen who have made a special culture of *Chrysanthemums* and *Begonias*, his nursery at the present time being well worth a visit by admirers of these flowers. Of *Chrysanthemums* the season is yet early for the majority of varieties, but a grand lot of plants is in course of development, and includes many novelties, promising a fine display at a later date. A good selection of early-flowering varieties is now in bloom, both indoors and in the borders outside. These are admirably adapted for planting in herbaceous borders, to succeed earlier flowering plants in the flower garden, and will continue to flower until cut down by frost. A selection should include the following, which are now nicely in flower:—*Mrs. Cullingford*, very free white of dwarf habit; *Fiberta*, bright golden pompon; *Nanum*, bluish-white, good; *Frederic Marronet*, orange striped scarlet; *La Vierge*, fine white; *Canary*, dwarf yellow pompon; *William Beaby*, creamy-pink; *Mrs. Burrell*, primrose. Others, flowering in pots, were *Feu de Bengale*, bronzy-orange; *Capucine*, buff; *Sam Henshaw*, rosy-purple, a seedling from *Comte de Germiny*; *M. Pynaert* van Geert, golden-yellow; and *Mr. William Holmes*, dark crimson with golden reverse, a fine early decorative variety.

*Begonias* are, however, just at this season the leading flowers here, both indoors and out. Several houses are filled with a magnificent collection, the doubles being very fine. Mr. Owen has been successful in raising some excellent varieties, and some of very large proportions. I noted among the best *Mrs. Graham Smith*, delicate flesh-colour, very good; *Miss Hammersley*, apricot; *Shirley Hibberd*, deep rose; *General Gordon*, red; *Scarlet Gem*, bright orange-scarlet, very showy; *Serapis*, deep pink of drooping habit; *Dr. Livingstone*, rich crimson; *Lord Beaconsfield*, primrose; *Royal Purple*, distinct purple; and *Davisii* fl.-pl. superba, of dwarf habit, erect flowering, and very free, a good decorative variety. Arranged on shelves suspended on either side of the pathway in the houses, the drooping varieties had a very good effect.

Among single varieties, Mr. Owen's Imperial strain includes some of the largest and best yet raised, and is characterised by an erect habit, rendering sticks in most instances unnecessary. On comparing some of the individual blooms with that figured in a recent work on the tuberous *Begonia*, it was found that several flowers were decidedly wider, the blooms more circular, and therefore of better shape. Many of the best have been named, and are increased by cuttings, for which there is a demand, although good flowers may be obtained from the seeds of this strain—and this is the quickest means of raising a stock. Some 25,000 plants—this year's seedlings—are planted out in soil which is rather poor and stony, the situation exposed and bleak, yet they are flowering freely. Some thousands of last year's raising, similarly treated, are now a mass of flowers, quite eclipsing the bedding *Pelargonium* this season. Those of similar habit and colour are grouped together as much as possible, with a view to raising distinct batches of seedlings. *C.H.D.* [We have not observed that these flowers have done very well generally this year. It has been too cool and rainy for them. Ed.]

## COLONIAL NOTES.

### NEW ZEALAND.

AUCKLAND.—The summer season, which commences here about December 21 (corresponding with June in Great Britain), has entered very bright and dry, the past few days having been extremely warm—a rather sudden change after the late frequent and copious showers.

At mid-day the thermometer ranges from about 70° to 75° in the shade. The temperature to-day (December 24) at noon was, in complete shade, 73½°; under verandah, subject to sun's rays 82½°. The following are meteorological observations taken at Auckland in December, 1886:—Mean temperature, 63°·4 (average for previous twenty-one years, 65°·2); maximum temperature, 73°; minimum temperature, 49°. Total rainfall, in month, in inches, 2·50 (average for previous twenty-one years, 3·225); number of days on which rain fell, five (average for previous twenty-one years, ten).

The public gardens and recreation grounds of Auckland, of which the Albert Park and the Domain are the principal, have at present a very gay appearance, many of the principal kinds of European annuals and perennials, which here as at home have to a large extent superseded much of the old familiar bedding stuff, are forming just now quite a floral display.

The Albert Park is beautifully laid out on an eminence situated almost in the centre of the city, and from the highest elevation, on which an imposing fountain is erected, an excellent view of the spacious harbour and the greater part of the city is obtainable.

The domain is a very fine public reserve, upwards of 200 acres in extent, the greater portion being thickly wooded with indigenous and other trees and shrubs. A short time ago the City Council accepted a design for laying out this reserve, and the work, in the shape of carriage-drives and walks, is now being

carried on. On a level portion of the reserve the Auckland cricket-ground is formed, and a very fine and commodious ground it is.

Government House grounds are nicely kept, and contain several kinds of European deciduous trees and shrubs; amongst the former are fine examples of the Oak. A number of young trees have recently been planted in the grounds, and appear to be doing well; amongst others I noticed *Abies Pinow*, *Alba*, *Picea orientalis*, *Menziesii*, *Smithiana*, *ex-celsa*, *Camphora officinalis*, *Photinia serrulata*, and *Magnolia purpurea*.

Among the host of plants now in full bloom the following are at their best:—Perennial and annual Phloxes, Pentstemons, Hollyhocks, Begonias, Gloxinias, Tuberoses, Lilies, Tritomas, *Amaryllis*, *Gladioli*, *Carnations*, *Picotees*, *Pinks*, *Balsams*, *Stocks*, *Aquilegias*, *Delphiniums*, *Verbenas*, *Heliotropes*, *Calceolarias*, *Pansies*, *Lobelias*, *Myosotis*, *Salvias*, *Petunias*, *Clematis*, and *Lonicera*; these are now taking the place of Tea, coloured, and Bankian Roses, which have continued in bloom, and been very fine up till now. *Pelargoniums* and *Fuchsias*, in great variety, are plentiful, and flowering profusely, the late showers having been favourable to their growth.

Other conspicuous plants now in bloom comprise *Escallonia rosea*, *Ceanothus*, *Ruellia tuberosa*, *Japanese Hydrangea paniculata*, *Bouvardia splendens* and other vars.; *Magnolia grandiflora*, *M. purpurea*, *Ligustrum japonicum*, *Deutzia crenata flore-pleno*, *Mock Orange*, (*Philadelphus grandiflorus*), *Laurustinus*, and the *Glory Pea* (*Clianthus puniceus*), also known here by the name of *Kowhiangutukaka*; there are here some splendid examples of this gorgeous flowering plant.

I must not omit to mention the beautiful and picturesque Pohutukawa (*Metrosideros robusta*) belonging to the natural order Myrtaceae, and allied to the *Callistemon*; scattered along and overhanging the high cliffs and bluffs of the harbours the garbled and twisted branches of these trees are now covered with charming deep crimson flowers, which are used here at this season as *Holly* is at home for decorative purposes, and the tree is generally known as the "Christmas Tree." The timber is highly valued in ship-building. This tree is the last that remains of the beautiful vegetation that once clad the shores of these bays and harbours.

Summer fruits are plentiful, and judging by the tempting displays in, and busy appearance of, the market and fruiterers' shops on Christmas Eve, the demand was in proportion to the supply. There have been an abundance of Strawberries, and the cry of "Strawberries!—fine ripe Strawberries!" has been familiar through the streets for some time past.

The following extract, which I take from the *Auckland Weekly News*, will give your readers some idea of the extent of the Strawberry industry in Auckland:—

"By the courtesy of Mr. B. Dawson, we have been supplied with some figures which will show the Strawberry-consuming capacity of the inhabitants of Auckland. There are, in all, about 200 acres planted in Strawberries, the largest portion of this area being at Northcote. The Devonport district grows only a comparatively small quantity, while on this side there are only two or three large growers. Mr. W. Mason, of Ponsonby, is one of the largest. He has 18 acres under crop, and for a long time past has supplied from 500 to 600 boxes daily. He employs about forty boys to pick the fruit, and he has a 'tin-can band' to frighten away birds and other fruit stealers. The average crop this season has been about 40 quarts per acre per day; some farms have given a larger yield than this, and some less. The average weight of a quart of Strawberries is 23 oz. This gives us 11,500 lb. or rather over 5 tons of Strawberries consumed by the Auckland public every day during the season. Reckoning the price of Strawberries at 6d. per quart, this industry has returned to the growers the very handsome dividend of £200 per day as the gross receipts during the season. Another way to look at it is that during the season every acre under Strawberries has given a gross return of £1 per day. Although none are so

popular as Strawberries, there are many other small fruits which bring in very acceptable dividends to the growers. Clearly, gold-digging and gum-scraping are not Auckland's sole salvation."

The New Zealand Frozen Meat and Storage Company have lately been turning their attention to the fruit-canning industry, which promises to become an important one to Auckland. Fruit growers have already taken advantage of the company's demand for Gooseberries, an instalment of something like 2 tons of fruit being sent from the Waikato district as a beginning. In all the company have received about 50 tons of Gooseberries, one grower forwarding as much as 3 tons.

The following are the prices at which fruits and vegetables were being sold by the principal fruiterers on Christmas Eve:—

*Fruit*.—Gooseberries, 5d. and 6d. per quart; Apples, 4d. to 6d. per lb.; Lemons, 2d. each; Pine-apples, 3d. each; Cocoa-nuts, 3d. each; Oranges, 1½d. to 2d. each; Cherries, black and red Kentish, 10d. to 1s. per pound; Loquats, 5d. per pound; Grapes, 2s. 6d. per pound; Plantains, 4d. to 5d. per pound. A few Apricots and red Currants were offered at high prices.

*Vegetables*.—Peas, 10d. to 1s. per peck; French Beans, 1s. 2d. to 1s. 4d. per peck; Scarlet Runners, 1s. 10d. to 2s. per peck; Cabbages, 1d. to 2d. each; Cauliflowers, 3d. each; Rhubarb, 4d. per bundle; Potatoes, 14 lb. and 16 lb. 1s.; Onions, 1½d. and 2d. per pound.

The advice of the Royal Horticultural Society of Auckland has lately been asked on the subject of exporting fruit from this province into the British market. This being to many here an important question, the Society have decided to call a special meeting to discuss the matter, when, no doubt, views will be expressed and information elicited on the subject that will help to develop the exportation of fruit from this province to England, which, if judiciously managed, should prove highly remunerative to Auckland fruit growers seeking an outside market for their produce. *Edgar Spooner, Auckland, N.Z.*

#### NOTES OF NATAL PLANTS.

*Greyia Sutherlandii*.—There seems to be a difficulty in flowering this fine shrub in England, but I think if cultivators could see it, as I have often done, in its home, the reputation it has for shyness in blooming would vanish. It certainly dislikes warm moist situations and rich soil. Never have I seen it under elevations of 4000 feet, or, in fact, growing in soil at all. Inserting its roots between clefts of sandstone rocks it holds on from year to year, and early in the spring, just before the leaves expand, sends out from the tip of each branchlet its beautiful and curious crimson flowers. Plenty of air at all times it must have. In winter it can be hardly kept too dry; in summer it needs abundant water; with as many stones as earth about the roots would nearly imitate its chosen home in Natal.

*Cyneniums*.—Some of the most lovely of South African flowers are those which have never flowered in Europe, and so peculiar are the conditions under which they grow that perhaps even the skill which flowered *Lissochilus giganteus* would find itself baffled before succeeding with the plants under noted. Not to speak of *Disa grandiflora*, which Professor McOwan once informed me could not be got to thrive in the Cape Town Botanic Gardens, nor to mention certain *Stapelias* collected by Sir H. Barkly in remote parts of the Cape, many of which refused to grow in Cape Town, I would refer to some lovely members of the great order, *Scrophulariaceae*. And first to mention *Cyneniums*.

*C. adoensis* is a prostrate creeping herb with fine large snow-white flowers like a single *Petunia*, opening in early spring. A parasite on roots of sundry grasses. Figured in the "North" Gallery, Kew, No. 449.

*C. tubatum*.—A robust leafless species, 2–3 feet high, with very showy white flowers in pairs, 2

inches across. Flowering in midsummer, and a parasite on roots of *Labiata*, &c. In the "North" Gallery, No. 402.

*C. racemosum*.—A very lovely plant, 3–4 feet high, with erect racemes of brilliant magenta flowers, as large as the last-named. Grows at elevations of 4000–5000 feet, seemingly parasitic on grass roots. Blooms also at Midsummer, and called by colonists Christmas-flower.

*Harveya (Lulaya) sp.*—This is a very good thing, though I am unable to give its specific name. A leafless herb, 12–18 inches high, with erect pale purple, Foxglove-like flowers, deliciously scented. Only found in dense shady bush, and is a parasite on roots of shrubs. See the "North" Gallery, 404, for a closely allied species.

*Graderia scabra*.—Habit like *Cynium adense*; flowers tubular, bright rose. Parasitic on grass-roots, and often grows in large patches with *C. adoensis*, the two making a very pretty sight when in flower.

*Striga coccinea*.—A little gem, about 9 inches high, with small, vivid-crimson flowers. I believe it is a parasite. Colonists believe it feeds upon and kills the roots of Indian Corn. Represented in the "North" Gallery, Nos. 402 and 440. All the above I have tried to cultivate, but in vain. Like the English Yellow Rattle (*Rhinanthus Crista-galli*) and Cow-wheat (*Melampyrum pratense*) they turn black when dried. *R. W. Adlam, Maritzburg, Natal.*

#### THE SEED TRADE.

THE DUTCH SEED CROPS.—Large quantities of vegetable seeds are grown in Holland, and, in so far as advices up to date are to hand, it would appear that the yield will fall considerably below general expectations. In consequence of the long winter it was very late in the spring before the proper tillage of the ground could be accomplished, and the crops cultivated. The spring, at first wet, afterwards became dry, but, whether wet or dry, the weather was cold and infertile, and, as in this country, it was followed by a summer like that of our own—wanting in warmth and sunshine. Cauliflower, which is largely grown in Holland, is a very late crop, though the plants developed well; but lack of sunshine must materially affect the yield, which will, it is expected, be much below the average, while, for some reason, not so much was planted as in former years. As to Cabbages, Savoy, and Kales, the prospects of a crop are in general bad, and especially so in the case of Cabbage; such a bad crop of the latter has not been seen for several years. Swede seed is but a moderate yield; and Turnips, only partially planted, show about half a crop. Many plants of Beet perished during the winter, and those saved will give but a small return. Corn Salad has been sown so little, owing to the low prices obtained in late years, that it is doubtful if the crop to be harvested will meet the demand for seed. On the other hand, Spinach seeds were sown more numerously than is usual, but the yield does not exceed two-thirds of an ordinary crop. Peas have furnished less than an ordinary yield, and the seeds have suffered so from rain that a considerable bulk must be picked from them. Radish looked well early in the season, but during the time the crop was in flower rain fell almost incessantly; many of the flowers were washed off, and the seed-pods which set were comparatively few. Then, instead of ripening the seed, the plants went again into flower, so that not more than half a crop can be looked for. Of the black Spanish Radish there will be only a small yield. Onion seeds are standing pretty well, but are very late in ripening. English Broad and Longpod Beans show but a moderate yield. Kidney and Runner Beans will be a small crop; they podded so late there is not time enough to ripen. The Cucumber crop is regarded as a failure. Chervil was sown but little, on account of the low price it fetched, but the yield was a good one. Carrot is expected to prove a pretty good crop. The result may be summed up in the statement that crops will be below a poor average; all that have to be gathered ripen very

slowly, and the weather is too uncertain to admit of what is becoming ripe being harvested in good character.

### A NEW WALNUT.

**JUGLANS MANDSHURICA** (fig. 53).<sup>\*</sup>—For the opportunity of illustrating this handsome, and, as far as gardens go, new Walnut, we are indebted to Mr. J. van Volxem, of Brussels, who kindly sent us specimens. The tree is a native of Amurland, and its botanical history is given in the works cited below. Here we need only say that it is a Walnut of very handsome appearance, the foliage (much reduced in our illustration) being of a very noble character. The fruit are obovate, somewhat pear-shaped, the nuts much more acutely pointed than in our ordinary Walnut, the shell hard and very coarsely ribbed. The kernel is not so good to the palate as the better kinds of Walnut; but considering that these represent the effect of long ages of selection and cultivation, there is reason to hope that the Mandshurian Walnut may be improved in like way. If so, the gain will be great, as the present tree is harder than the common Walnut, and ripens its fruits some 2–3 weeks earlier in the season. As an ornamental tree, from the great size and noble aspect of the foliage (30–32 inches in length), it will be a great acquisition, while its hardihood suggests it as a good stock whereon to work the more tender kind.

"The fruit," says M. Van Volxem, "ripens several weeks before the ordinary kind, and the tree is perfectly hardy in Belgium, where, as with us, the common Walnut gets injured by spring frosts.

## CULTURAL MEMORANDA.

### MICHAELMAS ASTER.

THE best of these are *A. novæ-angliæ*, *A. Drummondii*, *A. amethystinus*, and *A. novæ-belgii*, and if dwarf kinds are required for rockwork, *A. alpinus* and *A. discolor* will be found the most suitable, the last-named being very floriferous. All these Asters are readily propagated by division, for they spread freely. The shoots in spring should be reduced in number by pulling up the weakest, so as to leave only a fair number to bloom. To have those in borders at their best, it is necessary either to renew the soil or give the plants fresh positions, the latter being the most preferable, as the moving involves less labour; and when replanting, some rotten manure should be worked in below. *J. S.*

### HYDRANGEA PANICULATA.

This is one of the most showy of hardy plants, and the wonder is, that, having been introduced some years, it is not more known and grown than it appears to be, as it is seldom one meets with it in gardens. Not only is this *Hydrangea* a desirable shrub for beds or borders, but it is a very effective greenhouse plant. In habit it is deciduous, and has small hard woody shoots, which should be cut back pretty close, as pruning it in causes the plant to break stronger and produce finer trusses of blooms. If grown in pots, or planted out in borders, *Hydrangea paniculata* should have rich loam soil, and the best situation for it is in the foreground of low evergreens, or a bed to itself on the border, where it can get plenty of sunlight. The way to propagate and increase the stock is to put in cuttings of the half-ripened wood, and if these are taken off with a heel they strike more readily; but they should be put in under cover of a handlight in sharp sandy soil, and kept close till they root. *J. S.*

## PLANTS AND THEIR CULTURE.

**SELAGINELLAS.**—These form a very accommodating family of plants, some of which are largely used in floral arrangements, others for planting where little else would live; indeed, it would be difficult to find a greenhouse without a patch of the well known *S. Kraussiana* and *S. Martensii*; and perhaps it may be

under the plant stage, or some such out-of-the-way position, yet they rarely fail to live and clothe with pleasant greenery the bare soil or gravel. Still, the plants enjoy good positions, and where little specimens are required, plenty of light must be afforded them, or else they are apt to be attenuated and straggling. *S. Kraussiana* and other dwarf-growing species grown for the decorator's use are best grown in shallow pans, about 6 inches over. Drain them well, and fill with a light compost similar to that used for Ferns, then dibble them full of cuttings, selecting nice stout points of the shoots. When finished give a good watering, and stand them in a light position close to the glass, if in summer in an ordinary garden frame, but

named *S. apus*, and the varieties *densa* or *apoda*, also *Brownii*; these are all of a dwarf, neat habit, more so, indeed, than *S. Kraussiana*, but not being so hardy as that species, and requiring more care in watering, they are less suited for general purposes from liability to damp off at the centre of the mass. To reduce this drawback as much as possible, avoid pouring water into the centre of the plants, this bears down the branchlets, and causes decay, that is, if the plants are full-grown and in a matted condition. Other low growing species are *patula* and *serpens*; both are distinct from the preceding, having a more rigid and wiry habit, but are scarcely so hardy. *S. Martensii* and its variegated form, when

FIG. 53.—THE MANDSHURIAN WALNUT: LEAF GREATLY REDUCED.

time is saved if a little artificial warmth be afforded them, though it is not indispensable in the case of the first-named species, which is nearly hardy, and can be brought on in cold frames in the summer time. To induce a dense, even growth they should be several times clipped over, removing all straggling points, so that when they are turned out of the pans for use, they will be sufficiently matted together to prevent their falling to pieces; and the best way to put them on or round plants, is to cut through to the centre of the mass, and slip the stem of the plant through the cut, they will thus appear to have been grown in the pot or vase, and will last good for a long time. There is also a golden and a variegated variety, either of which is quite distinct, and may be included in any collection. Of others suitable for decorative purposes may be

grown in small pots, make capital substitutes or change for Ferns, and will stand a great deal of rough usage. Other species useful for growing in pots are *S. caulescens* and *inæqualifolia*, both with Fern-like branches. Of a still more erect and massive habit are *S. hæmatodes* and *S. grandis*; both require a liberal allowance of root-room and stove heat. There are also several species which have a trailing habit, such as *S. Galeottii*, a free growing species, well adapted for growing in baskets or in pots to hang from the edges of shelves. *S. uncinata* or *cæsia* is also suitable for this purpose. It has a metallic steel-green hue, much admired by some persons. Unfortunately it dies back considerably in autumn. To keep the stock neat frequent renewals must be made.

**Pelargoniums.**—All plants which have been cut back and have since broken should be shaken out and

<sup>\*</sup> *Juglans mandshurica*, Maximowicz, *Primit. Flor. Amuren.* (1859), p. 76; *Cas. de Candolle*, in *DC. Prod.*, xvi., 138 (1864). *J. Sieboldiana*, Maximowicz.

reputed before growth is far advanced. Turfy loam with some well decayed manure which has been rubbed through a sieve, a sprinkling of soot, and enough sharp sand to keep it open, is an excellent compost for them. The sweepings from a veterinary forge when thrown in a heap and allowed to lie until well decomposed, is splendid stuff for mixing in the compost for *Pelargoniums*. With old specimen plants it is usual to pot them into smaller pots, and again potting later on, which is an excellent practice; but good results may be had by placing them in their flowering pots at once—a very convenient method for large plants, but the other is preferable, generally. After potting water must be sparingly afforded until the plants have fairly occupied the new soil. At this stage, when not exposed to very drying influences, I have known plants to go for weeks without requiring to be watered, other than being damped with a syringe on bright days for a short time after potting. Specially guard against the attacks of greenfly by occasionally fumigating with tobacco. Zonals for winter flowering, which have grown satisfactorily, but have not been placed in their flowering quarters, should be removed to them without delay, as if they are left out in cold frames the flower-trusses will be liable to injury by damp. The best position in which to flower these plants during winter is in rather narrow and low houses with a steep pitched roof; the range running east to west would catch every ray of sunshine, and being narrow the steep pitch of the roof would not favour drip. In arranging the plants avoid crowding, but place them in such a manner that the pots may be examined readily before giving water to the plants. A mild or rather dry air at a temperature of 50°–55°, and ventilation in small amount on bright days, will maintain a brilliant display. As the pots fill with roots liquid manure should be afforded the plants at regular intervals.

*Ixoras*.—To flower *Ixoras* well, a minimum temperature of 70° should be sustained, and at no season is this more requisite than the present. If there be any deficiency of heat, not only will their flowering period be short, but the flowers will lack size and substance. Keep the roots in a state of uniform moisture, but a sodden condition must be avoided, and in using liquid manure, it should be largely diluted with water, and may be applied to the plants often. Plants which are getting past their best may as well have their shoots cut back; taking any strong, clean points, which have not flowered to make cuttings. These, if rooted quickly and grown on, will make nice stuff with a large truss or two of flowers each, next year. *F. Ross, Bletchingley.*

## THE FLOWER GARDEN.

**FLOWER BEDS.**—Sharp frosts will have been experienced generally over these islands, and the beauty of tender kinds of plants destroyed. No time should be lost in taking up all plants which are to be saved. Tuberos *Begonias* should have the stems cut down to within an inch of the tubers, placing the latter in a cool dry shed for a week or two, afterwards storing them away for the winter in sifted cinder-ashes or cocoa-fibre refuse, in some place where they will be safe from frost, and, at the same time, where they will neither get too damp nor too dry. I usually put them in an old stable at first, and afterwards under the staging in a late vinery. Zonal *Pelargoniums* of one year old should be preferred for keeping through the winter by shortening back the strongest roots; cleaning and trimming the tops in the usual way, leaving from four to six shoots to each, and afterwards put them in shallow boxes, 8-inch pots, or heel them in, on Vine or Peach borders under glass, and withhold water for the present. *Alternantheras* may be potted up into 3-inch pots, using plenty of drainage and a sandy loam and leaf-mould compost, placing them in warm pits or houses afterwards. *Echeveria secunda* glauca in southern countries can be safely wintered in cold frames; and, where large quantities are grown and this method is inconvenient, the better practice is to build them up in banks of cinder ashes against a south wall, outside; the only protection given being to cover them with garden mats on frosty nights. Succulents of a more tender character should be placed in pots or boxes, and put in a cool, airy greenhouse. *Palms*, *Aralias*, *Phormiums*, *Dracenas*, *Grevilleas*, &c., if not already moved

to their winter quarters ought to be forthwith. Avoid overwatering all such plants during the winter months, and afford free ventilation at all favourable times. Clear away to the rubbish heap all other plants not required, and if the beds are to be replanted with Wallflowers, Arabis, *Mysotis*, and other spring flowering plants, it is a good plan to give them a light dressing of old hotbed manure, to be dug in with the staple and left in rather a rough state for another week or ten days previous to planting. The beds for *Hyacinths*, *Tulips*, &c., will require special preparations if the best results are desired; the beds ought to be well drained, and a liberal dressing of rich manure and sandy loam dug in—planting to be deferred to a later period; meantime the bulbs should be in readiness, and a decision come to in regard to the arrangement of colours, height, &c. Beds, borders, and clumps in the winter garden which are to be filled with Conifers and dwarf evergreen shrubs, ought to be got in readiness before the end of the month.

**Bedding *Calceolarias*.**—If not already done, cuttings of these should now be put in; fortunately there is no lack of them this autumn. They are best rooted and wintered in cold frames or turf pits—the latter are preferred by many practitioners, and should be made about 4 feet wide inside measure, 2 feet high at the back, and 18 inches in front, using for the purpose turves about a foot in width and 2 or 3 inches thick, beat down with a spade, or make it firm by treading as the work proceeds. Fill the inside afterwards with half-decayed manure, such as has been used for linings to Cucumber or Melon frames, and tread it down quite firmly; on the top of this place a layer of sandy compost and leaf-mould with a surfacing of sharp sand about half an inch deep, and smooth over with the back of a spade, after which the cuttings may be inserted in rows about 3 inches apart. If the weather happens to be dry at the time give them a light watering overhead through a fine rose, cover with frame-lights, and keep them shaded from bright sunshine till rooted, and on frosty nights protect with mats. After they are rooted attend to ventilation on all favourable occasions. *J. Horsfield, Heytesbury.*

## FRUITS UNDER GLASS.

**PINE-APPLES** which are swelling off should be kept steadily at 70°–75° at night, and 80°–85° by day. Do not use dung-water at this season of the year. When stimulants are given, dust the surface of the soil with Thomson's manure, and water alternately with water only just coloured with guano. Large-fruited varieties, as *Cayenne*, *Charlotte Rothschild*, *Providence*, &c., should be well watered just at the point of commencing to colour, and no more water afforded them, as a damp state of the soil during the ripening stage is liable to cause blackness at the core. Keep the bottom-heat at 85°–90° for fruiters in all stages of swelling, and any plants which may have started amongst the general stock should be removed to the fruiting division at once, as the temperatures in the other divisions will be too low to suit their requirements. If a few suckers are put in as they become large enough, they are certain to start at other times than the general stock, and require to be looked after.

Those plants which have been under special treatment for the past few weeks, and are intended to start early in the season, should now be kept perfectly quiet till the beginning of the year. If the plunging-bed be in a moist condition, little or no water will be necessary with the lowered temperature. Let the temperature for these be 60° for cold nights, and 55° for mild ones. When the sun shines and the thermometer exceeds 65°, give a little air. With the roots of the plants in a state of partial dryness the bottom-heat may be allowed to decline to 75° without fear of injury. When the bottom-heat is obtained by leaves and tan great care must be taken not to exceed 80° when fresh materials have to be added, which frequently happens at the decline of the year, when fresh material must be employed to freshen up the old. Let the bed be well trodden to prevent as far as possible a too sudden or a great rise, and to make sure partially plunge the pots until such time as the heat has declined to a safer point.

Successions should not be encouraged to grow much after this season, as the growth made now will be lacking in substance; and give only sufficient water to keep the plants in a state of health. As a plant

in a state of partial dryness will stand a much lower temperature than a wet one, 65° will be quite high enough as the night temperature, and air should be given to the pit when the thermometer reaches 70° by day. Suckers which were potted in August will have well filled their pots with roots. Should any of them be likely to require more pot-room before the winter is over it is better to give a shift into pots one size larger. Let the bottom-heat be lowered to 80° and air admitted when the thermometer reaches 70°. The night temperature should be 60°–65° at present. The fires should now be started in the afternoon to prevent a too rapid decline of the side warmth. *W. M. Baillie, Luton Hoo.*

## THE HARDY FRUIT GARDEN.

**LIFTING AND ROOT PRUNING.**—The season is now at hand when these operations will demand attention, and in the meantime it would be well to get some sound fibry loam coarsely chopped up so that when the work is taken in hand there shall be no delay. Loam is generally all that is needed for this purpose, unless the soil should be of a very heavy nature, when a little lime rubble or burnt soil may be added, to induce the trees to make plenty of fibrous roots and short-jointed fruitful wood. It is best to take this kind of work in hand as early in October as circumstances will allow, and while the trees still retain their foliage, so that advantage is taken of some slight root-action before the total fall of the leaf. Fruit trees, owing to loss of crop by frost and a too rich soil, are liable to make an excessive amount of unfruitful wood; such trees can always be brought to a fruiting state by being root-pruned or lifted. For bushes and low pyramids lifting the roots is the best, as they can then be examined readily, and can be laid out in a regular fashion and within a short depth from the surface. In fact by carrying out lifting in a systematic manner such trees can always be kept within bounds, which is a great desideratum in small gardens. The roots should always be lifted with a ball of soil attached in proportion to the size of the tree; the tap-roots, if any, must be cut away, and the ends of all roots that may be broken in the lifting neatly trimmed with a sharp knife, when the tree may be returned again to the same hole from which it was lifted, or planted in another situation. When filling in about the roots use a barrowload or more of the prepared soil, place some at the bottom of the hole, and mix the remainder with the staple soil, in which to lay out the roots, and tread all moderately firm. When all is finished give a good watering, and afterwards mulch the surface; and should the weather be sunny for any length of time an occasional syringing will be beneficial. For large trees root-pruning, and not lifting, must be resorted to. This will consist of taking out a trench a certain distance from the stem and securing all the roots found as the digging proceeds, taking great care to dig out the soil under the ball, and cut away the descending tap-roots. If the tree is a very large one it is not advisable to prune the roots the whole way round in one season, but to do so in a bare one year and the remainder the next. The distances from the stem at which the trench should be taken out must always depend on the stretch of the branches, but as a rule the distance may vary from 2 feet to 3 feet 6 inches. The ends of the severed roots must be neatly trimmed off, and when filling the trench again, add a fair proportion of new soil—unless the staple is unsuitable, when it would be advisable to fill with new soil, proceeding as before. *A. Ward, Stoke Edith Park.*

**VEITCH'S PERFECTION PEA.**—When walking lately through the large well-cropped kitchen garden at Harewood House, in this county, I was much struck by several rows of the above-named Pea. Owing to the wet season we have had in the North, the haulm was fully 18 inches higher than is usual in drier seasons—it was close on 5 feet high. Each side of the rows was fairly thatched, for about 2 feet 6 inches, with large, well-filled pods of Peas, of first-class table quality. On the same quarter were a number of other Peas growing, including some of the newer varieties, but Mr. Fowler, the gardener, told me that none came up to Veitch's Perfection as a really trustworthy Pea during the month of September. *H. J. C. Grimston, Tadcaster, Yorks.*

## APPOINTMENTS FOR THE ENSUING WEEK.

### SHOWS.

THURSDAY OCT. 11.—Crystal Palace Fruit (three days).

### MEETINGS.

MONDAY, OCT. 8.—Chambre Syndicale of Ghent.

TUESDAY, OCT. 9. { Royal Horticultural Society : Fruit  
and Floral Committees.

WEDNESDAY, OCT. 10. { National Chrysanthemum Society :  
Floral Committee.

### SALES.

MONDAY, OCT. 8. { Dutch Bulbs, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.  
Greenhouse Plants, at Fraser's Nursery, Lea Bridge Road, by Protheroe & Morris.

TUESDAY, OCT. 9. { Vertegans' Nurseries, Birmingham, on the Premises, by Protheroe & Morris, in conjunction with W. O. B. Cave.  
Nursery Stock, at Tansley Nurseries, near Matlock, by Elise & Son (three days.)

Nursery Stock, at House's Nursery, Peterborough, by Protheroe & Morris.  
Nursery Stock from sample, at Protheroe & Morris' Rooms.

WEDNESDAY, OCT. 10. { Dutch Bulbs, at Stevens' Rooms.  
Collection of Orchids formed by M. Rougier-Chauvière, at 153, Rue de la Roquette, Paris, by MM. Dulong & Godefroy-Lebeuf.  
Nursery Stock, at North's Nursery, Lee, by Protheroe & Morris.  
Miscellaneous Plants, at Protheroe & Morris' Rooms.  
Nursery Stock, at the Nurseries, Milford, Surrey, by Protheroe & Morris (four days.)

THURSDAY, OCT. 11. { Collection of Orchids formed by R. Warner, Esq., of Chelmsford, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.  
Established Orchids and Greenhouse Plants, at Castle Nursery, Lower Norwood, by Protheroe & Morris.

FRIDAY, OCT. 12. { Imported and Established Orchids, at Protheroe & Morris' Rooms.  
Nursery Stock, at The Nurseries, Dorking, by Protheroe & Morris.

SATURDAY, OCT. 13. { Dutch Bulbs, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.

The Chiswick  
Fruit  
Conference.

DECIDEDLY the most successful and the most generally appreciated of the Conferences that have been held of late years by the Royal Horticultural Society was the Apple Congress and Exhibition held in the old gardens at Chiswick in 1883. The story has been told so often that we advert to it now only for the purpose of reminding our readers that a similar Congress, but on a more limited scale, is to be held in the same gardens on Tuesday, 16th inst., and two following days. The exhibition of Apples and Pears will be open to the general public on the Tuesday after 1 P.M., and the business of the Congress will be transacted on Wednesday and Thursday, beginning probably at 1 P.M., in the great Conservatory. The papers promised are, we believe, as to subject, of singular importance, variety, and interest; and from the known competence of the writers they are likely to be well handled.

The idea of holding this Conference at Chiswick is an excellent one. We earnestly hope that the Council will see to it that this grand opportunity is not thrown away, but that it may be utilised not only for its specific purpose but as one means of developing the garden, and rendering it the centre of all the practical work of the Society, while the library and offices in Victoria Street may be available as a "house of call," as also for business pur-

poses, lectures, and smaller exhibitions of new or interesting plants. The larger exhibitions could then be held in various localities, as circumstances might suggest or dictate. But these are matters for the future.

The second Apple Congress is about to be inaugurated, and although we cannot expect it to be so, we may still hope that it will be as successful as the former one. In the meantime we do not see that any special means have been taken as yet by the authorities to make the programme generally known to the public, and not much, if anything, has been done to apprise the Fellows, other than those specially interested in pomology. There is no time to lose.

The  
Weather.

THE dreary sunless summer was succeeded, at least, in the South, by a short spell of brilliant weather which raised our hopes and cheered our spirits. Realised visions of the Indian summer charmed us in their splendour, while other visions of "well ripened wood" and its consequences, gave us promise for the future. The realisation of this promise, however, seems destined to be visionary indeed. Some weeks ago even frost was experienced in many places, with disastrous results to Beech and other trees, specimens of which reached us without any intimation at the time of the frost to which they had been subject. Now, Mr. WEBSTER, writing from Kent, says:—

"In answer to several correspondents, I may state that the injury caused to the young (and old occasionally) shoots of the Beech proceeded directly from the untimely frost to which we were subjected some five weeks ago. In this district it is pitiable to see the Beeches, the branch tips of almost every tree being quite destroyed. No cure, save by pruning—and that would entail much labour and consequent expense—can be recommended. Nature will set matters right next spring."

This frost must have been local, but now a general visitation has occurred, and a sudden fall of temperature all over the country, but especially in the North, has given us experience in many places of "snow in harvest." Great is the wail accordingly. A week or two more of sun and drying wind would have been so acceptable, but it was not to be. The night of Sunday, September 30, was generally very cold throughout the country. Around London frost was registered in several localities, 2° at Chiswick.

On October 1, a correspondent writes from Doncaster, there was a heavy fall of snow, followed by 10° of frost. The havoc to the flower garden may be conceived. Young Conifers, Cherry Laurels, Yews, standard and dwarf Roses, had to be lightened of the weight of snow that rested on them. At Grimston, in the same county, 10° and even 14° of frost were registered on the same night. All tender vegetation was completely cut down, and Chrysanthemums were blackened.

On the night of October 2, in a garden near London exposed to the North, the frost must have been severe, though no actual record is available. Nevertheless, sufficient indications are afforded; the appearance of Sycamore leaves, as if they had been boiled; the African Marigolds reduced to the colour and substance of boiled Spinach, the foliage of tuberous Begonias looking as if they had had an attack of Potato disease, Sunflowers drooping their heads as if from very heartache at the cruel treatment to which they were exposed; Tropæolums laid low, their stems blanched like the vegetable remains one sometimes sees thrown up on the sea-beach; white Japan Anemones reduced to the colour of

dirty rags; the beauty of *Lilium auratum* and *Tritoma* destroyed, and even *Chrysanthemums* much injured. The great severity, however, seems to have been limited to a small area. Within a few hundred yards, in a more sheltered position and in a different aspect, the havoc was not nearly so great. At Kew also, we learn that in one part of the garden one degree of frost only was registered, on the same night; while in another part six degrees were noted, with the result that *Salvias* were blackened (with the exception of S. Greggii and S. Grahami), and *Anemone japonica*, *Dahlias*, and bedding plants generally sadly cut.

But why prolong the miserable catalogue? The end has come a little sooner than was expected, that is all. The beds will be cleared for the bulbs sooner than could otherwise have been done, to the great advantage of the bulbs, and the beautiful tint of the evergreens, and especially of the young Conifers, compel attention, particularly the Colorado Spruce (*Picea pungens glauca*), whose lovely shade of colour persists throughout all vicissitudes of weather. It is worth while incidentally to mention, that among the seedling forms of this plant (better known under the erroneous name of *Parryana glauca*) every gradation of tint is observable; but even the green-leaved plant—the type, as it may be called—is a remarkably handsome Spruce. Those, however, who would know the full beauty of this shrub, should visit a nursery where large quantities are grown, as at Knap Hill, for instance, and select individual plants. Whether the plant will be handsome as it becomes adult, or whether it will become scraggy at the base, as so many Conifers, and especially Spruces, do, remains to be seen. We allude to the plant in this connection to remind any too despondent reader that the beauty of a garden need not by any means be destroyed because a smart snap of frost happens to have cut off the more tender occupants.

Another matter suggested by the frost may be mentioned. The Royal Horticultural Society has lately been reinforced by a large number of new Fellows, who, as well as many old ones, may like to be reminded that by far the most elaborate report on the effects of frost on particular plants in particular localities throughout the British Isles is that published under the auspices of the Scientific Committee by its Secretary, the Rev. GEORGE HENSLAW. Those who are interested in knowing what is likely to succeed and what is not in their respective localities, should provide themselves with a copy of this publication, which can be had for a small sum on application to the Assistant-Secretary of the Society, 111, Victoria Street, London, S.W., and to which some who were Fellows at the time of publication are probably entitled, but of this latter point we are not sure. At any rate, we know that many grumblers at the irregular appearance of the Society's publications do not avail themselves of their privileges when they might do so, while many are unaware of the value of what has been published.

THE PUBLIC GARDEN, FUNCHAL, MADEIRA (see Supplementary Sheet).—The public garden of Funchal is of recent formation, and though it has not yet had time for its full development, it has greatly improved the appearance of the capital of Madeira. Close by is the handsome little theatre—another important improvement. The garden is stocked with Palms, *Dracænas*, *Sorew Pines*, *Yuccas*, *Bamboos*, *Jacarandas*, *Astrapenas*, and other inhabitants of warm climates, all growing, be it remembered, without any protection. Internixed are

specimens of *Ficus*, *Araucaria*, *Brugmansia*, *Hibiscus*, *Abutilon*, &c. With these there is an undergrowth of *Mesembryanthemum*, *Gazania*, *Euphorbia*, &c. Amongst the showy climbers are *Passion-flowers*, *Bougainvilleas*, *Tecomas*, and *Combretum*, besides the deliciously scented *Stephanotis* and *Trachelospermum*. Here and there are small pieces of water with plants suitable for such a habitat. In the course of time this mingling of vegetation derived from all quarters of the globe will produce a delightful effect. In former days there stood on this site a house of Franciscan Friars, which was suppressed by the Government more than forty years ago. To quote from Mr. J. Y. JOHNSON'S truly admirable *Handbook for Madeira*, the third edition of which was noticed in our columns a year or two ago:—"The ruined monastery and its single Palm are gone, and in their place we have a gay promenade. The chapel of the convent was entirely lined, both walls and ceiling, with human skulls and thigh-bones. The skulls were supposed to number at least 3000." More cheerful objects now meet the stranger's sight when he visits the spot.

**NATIONAL APPLE AND PEAR CONFERENCE AT CHISWICK, OCTOBER 16 TO 20, 1888.**—A meeting of the Executive Committee was held in the Royal Horticultural Society's Gardens at Chiswick, on September 27. Present:—The Rev. W. Wilks, in the chair; Messrs. Bunyard, Cheal, Herbst, Walker, Hibberd, Dean, Hudson, Turner, Rivers, W. Paul, and J. Smith. Papers to be read at the Conference were promised by Messrs. G. Bunyard, J. Cheal, J. Douglas, E. Tonks, S. Hibberd, J. Fraser, W. Wildsmith, E. J. Baillie, M. Dunn, McDonald, Tallerman, T. F. Rivers, Saunders, Bear, and W. Paul. Great interest was manifested in the proceedings, promises of support being received from the leading growers. It was agreed that the Conference be held in the Conservatory on Wednesday and Thursday, October 17 and 18, the first day (October 16) being devoted to the examination of the fruit, the General Committee meeting at 3 p.m. for the formal opening of the proceedings. It was agreed that no prizes be awarded, but cards of commendation for special merit will be given by the committee. It was decided that the various papers be put in type, previous to the Conference, for the more convenient use of the committee and Press. The Gardens will be opened to the public at 1 p.m. on October 16. Notices of intention to exhibit should be sent to Mr. A. B. Barron, Royal Horticultural Society's Gardens, Chiswick, not later than Wednesday, October 10.

**"KEW BULLETIN."**—The October number is devoted to a continuation of the reports on colonial fruits, showing the fruits produced in each colony, the price, and the supplies available for exportation.

**THE NATIONAL FRUIT GROWERS' LEAGUE.**—The following communication has been received without any name attached:—"The inaugural meeting of the National Fruit Growers' League will take place at St. Albans on Tuesday next in the Corn Exchange, at 7 p.m. Prior to the meeting a Fruit Conference and banquet will be held, at which several Members of Parliament are expected to take part. The Mayor of St. Albans will preside. A Conference to inaugurate a National Horticultural College at Swanley, founded by the League, will take place on the 15th inst. The grounds of the College cover 150 acres of land."

**THE SCOTTISH HORTICULTURAL ASSOCIATION: POMOLOGICAL SECTION.**—The subject of the formation of a pomological section in connection with this Association, which was remitted at last monthly meeting to the Council for consideration, was discussed at a largely attended meeting of that body on Friday evening, the 28th ult. It was unanimously agreed that steps should be taken to organise such a section, and the following small committee was elected to formulate the scheme, and report to the Council at a future meeting:—Messrs.

M. DUNN, ROBERTSON MUNRO (Secretary), ALEX. MCKENZIE (Treasurer), MORRISON, McHATTIE, GROSSART, and SUTHERLAND.

**CODE OF JUDGING.**—We understand that a book of rules for the guidance of judges at flower shows is in course of preparation by a Scottish exhibitor of great experience. It will comprise an account of an improved method of judging, with instructions for the growing and showing of all kinds of horticultural produce. We shall look for the publication with interest, as up to the present time we know of no modern treatise on the subject, except the admirable rules laid down by our late friend and colleague, THOMAS MOORE, and published in these columns, but, unfortunately, never reprinted.

**MONTHLY STOCK-TAKING.**—The following statistics are extracted from the "Trade and Navigation Returns" for August. The reasons for their publication are given with No. 1 of the series, published on p. 186. The Returns are divided into nine sections; we extract only such matters as concern home growers and our friends in the colonies. Table I. is made up of a summary of the imports from foreign countries and British possessions for the month of August, the total value amounting to £30,006,140, against £29,699,020 for August, 1887; or an increase of £307,120. The sections in this summary with which we are concerned are as follows:—

	Month ended August 31.		Increase (+) or Decrease (—)
	1887.	1888.	
	£.	£.	
Articles of food and drink—durable ...	2,149,332	2,291,199	+141,867
Chemicals, Dyestuffs, and Tanning Substances ...	517,310	562,960	+45,650
Raw materials for textile manufactures ...	3,998,765	3,051,507	—947,258

**A NEW FORAGE PLANT.**—The *Revue Horticole* of August 1 contains an account of *Iris pabularia*. This plant was made known to the Société d'Acclimatation by M. ERMENS, who was formerly in the service of the Maharajah of CASHMIR. In Cashmir, it appears, *Iris pabularia* is extensively grown for fodder on account of its nutritive properties. It is

\* In "vegetables, unenumerated," there is a decrease in value for the month of £7195.

thought that it would do well in Algiers and Central France, if the seeds were raised in a nursery and transplanted about February. In the Paris climate, which is not so congenial to it, it should not be planted out until March and April. When once rooted it is said to be almost impossible to extirpate this plant. The seed (which is offered for sale by Messrs. VILMORIN ANDRIEUX ET CIE.) should be well soaked before it is sown. There are many parts of India and Australia where it might be advisable to attempt the culture of this plant.

**REPORT ON MACWARRIEBALLI.**—This nice-sounding popular name is applied by the natives of Guiana to a new indiarubber-yielding plant, botanically known as *Forsteronia gracilis*. It was met with by Mr. JENMAN in the forests of the upper reaches of the Demerara River. Happening to strike a climber with his cutlass, Mr. JENMAN noticed a plentiful outpour of milky juice. No leaves or flowers were visible, and it became necessary to cut down the tree supporting the climber, when, though no flowers were obtained, it was evident the plant was a member of the Apocynaceæ. The rubber collected is very favourably reported on, and provision has been made to cultivate it in the Botanic Gardens for future distribution.

**ALLAMANDA HENDERSONI.**—If any one would realise the remarkable freedom of bloom of which this glorious New Grenadian stove creeper is capable, he should pay a visit to Gunnersbury Park, and see a stove-house there covered on the interior of the roof with this plant. The house is 27 feet by 9 feet, and the roof is a mass of yellow blossoms. It is planted out in a corner of the house, is yearly cut back very hard, and then for two months is kept without water.

**BRITISH GUIANA.**—Mr. JENMAN'S annual report of the Botanic Garden is an elaborate document, giving in detail accounts of the weather and the effect on the plants of a prolonged drought, albeit the annual rainfall amounted to 84.2 inches, the greater part of which fell in the early months of the year, leaving the subsequent months parched. Among the experiments recorded is that of a successful cross between *Peristeria alata* and *P. pendula*. A large portion of the report is occupied with the description of various sorts of Sugar-cane, and an analysis of their chemical composition.

**EDUCATION IN HORTICULTURE.**—On the occasion of the fourth annual meeting of the Society of American Florists, at New York, on August 21 last, President HILL, in the course of his address, alluding to the future of horticulture in the United States, said, in terms similar to those we have so often made use of here:—

"Fellow members, what we need, and what our profession demands, is a training-school for our children and the young men who are to follow in our footsteps, where they shall be taught a scientific and technical knowledge of the things pertaining to plant-life, and plant-growth, in their relations to soil, and heat, and water. Our need, and the need of the young men who are to follow, is such an education as will enable us to analyse soils, and to know scientifically their constituent parts, and their relation to the fibre and tissue of a plant; to be able to detect deleterious and injurious substances, to check and control the chemical action in soils, to adjust to a nicety the things termed heat, food, and water. Our most successful men are often confounded and amazed at their own failures, and can seldom assign an intelligent reason for the same. Often in the same house, under apparently similar conditions, with the same kind of soil, failure attends where in former years was had abundant success. Instances of the kind abound on every hand, and we are all familiar with them. This need not be, for with a right education and proper training—such as I hope awaits the young men of the future—these problems, so serious and difficult to ourselves, will to them disappear as the dew before the morning

sun. This knowledge, so desirable and important, can only be imparted by specialists and teachers devoted to such work. If we would have our profession keep pace with the industrial and material development of our country, it is incumbent upon us to dig deep, and lay wide the foundations on which the future of our profession is to rest. Industrial and scientific education is making remarkable progress the world over, and we, who have the good of the profession at heart, must see to it that it is kept abreast of the times. With all our boasted achievements in plant growing and flower production, the fact remains that it has been wrought out by an enormous waste of time and physical force. How to correct this, by what means, is the question uppermost in the minds of many thoughtful florists. Mr. TROOP, in his address to you at Philadelphia, expressed a desire that at no distant date there might be established a National Experimental Garden; if to that could be united a school for the special training of persons for our vocation, where a practical and scientific education would be imparted, such an institution would prove of incalculable benefit to every member of the trade."

**SCOTTISH HORTICULTURAL ASSOCIATION.**—At a meeting held last Tuesday, the 2nd inst., Mr. HUGH FRASER, Leith Walk, read an interesting paper on the "Oaks of the World." Mr. M. DUNN, Dalkeith, occupying the chair. The lecturer referred to the old and historical Oak trees in the British Isles, and spoke of the merits of *Q. sessiliflora* and *Q. pedunculata* as timber trees. He also illustrated his remarks by a collection of about sixty species and varieties of *Quercus*. Among the exhibits were *Acerides Rohanianum* (ex SANDER'S importation, 1886), with three fine spikes of flower, the first that has flowered in Scotland; and *Catesbeum macrocarpum*, both from Captain MAXWELL, of Terregles, Dumfries (ALEX. CHALMERS, gardener). The former is obviously a very free-flowering species. Mr. GROSSART, gardener, Oswald House, Oswald Road, Edinburgh, exhibited a dish of excellent Stirling Castle Peach from the open wall, the splendid colour of which was striking. Mr. FAIRGRIEVE, Dunkeld, sent ripe samples of Silver Peach from the open air, showing the peculiarities of the variety, and its adaptability for outdoor culture in the North. They were handsome and well developed fruit, having a creamy-white skin. From the same grower came also samples of Hale's Early and Lord Napier Nectarines, each very fine; and also COOPER'S Market Apple, a handsome dessert variety of American origin, which appears to adapt itself well to the climate of the North. A small branch, about 1 foot long, of *Abies nobilis*, bearing six cones, was exhibited by Mr. FRASER. It was taken from a tree about 9 feet high. He also exhibited a branch of *Vitis purpurea*. Mr. McMORAN, The Gardens, Glasserton, Wigtownshire, exhibited some extraordinary fruit of a variety of Fig known locally as the Glasserton Fig. The tree is over one hundred years old; fruit had been gathered from it from August 21, the average weight being 5 to 5½ oz. The tree covers an area of 600 square feet of wall.

**LOBELIA CARDINALIS.**—For brilliancy of foliage and flower this *Lobelia* is almost unsurpassed. Raised from seed, I find the red Iresine-like foliage varies a good deal, as many of the plants come green, and others only coloured slightly, but a good percentage remains true, and these can always be kept for stock. The way to increase the plant is by division, or taking the offsets. In moist situations it does very well outdoors, and is a striking object in beds mixed with patches of *Dactylis glomerata* variegata, or almost any other plants with a like foliage, white-flowered *Lilies*, *Gladioli*, &c., to afford contrast of colour. Although it will live through some winters in the open, it is safer not to leave the plants out, but to lift and lay them in boxes, and store in cold frames, when in spring they may be split up and increased. Those intended for pots should, about the end of May, be stood outdoors in some shady spot, and if supplied with plenty of water and liquid manure, they will be fine and strong for the autumn. J. S.

## THE FERNERY.

### GONIOPHLEBIUM SUBAURICULATUM.

WHEN seen under favourable conditions, this is one of the most beautiful of cultivated Ferns. It is especially suited for growing in hanging baskets; in fact, it can only be seen to advantage when growing in a suspended position, as the long drooping pinnate fronds cannot properly develop except where they are free. A peculiarity of this Fern is, that the fronds continue to elongate for a considerable time after the lower portion is fully developed. Under good treatment the fronds will attain to 6 feet, or even more, in length. This Fern requires a stove temperature, and is very easily damaged by allowing the temperature to fall too low. Discoloration of the fronds will surely be the result if once allowed to feel the cold. Baskets are not only preferable, by reason that they are more suitable for suspension than pots, but also allow the creeping rhizomes to spread more freely than when confined in pots. Where pots or pans, which are the most suitable of the two, are used, the plants should be kept well above the surface, using good porous soil and plenty of drainage. Although this Fern requires some care to succeed well with it, a well-developed specimen will amply repay any extra attention that may be bestowed upon it.

### ADIANTUM MUNDULUM.

This pretty compact-growing *Adiantum* is sometimes confused with *A. Pacotti*, but it is quite distinct from that species or variety (whichever it may be considered). The habit of growth is dense and compact, the fronds are erect, the side pinnæ curving inwards rather than outwards, which is the case with *A. Pacotti*; the pinnules are also smaller and more distant, and of a lighter shade of green. A very good example of this useful *Adiantum* was exhibited at the meeting of the Royal Horticultural Society on the 11th inst., the exhibitor being under the impression that it was a new variety, obtained by crossing *A. cuneatum* with *A. Pacotti*. This is one of the prettiest of the cuneatum section of *Adiantums*, and very useful for cutting from, especially for button-hole work, the fronds being a nice size for that purpose; as a pot plant, too, it may be recommended, as it forms a compact symmetrical little plant, very useful for many purposes. *Pteris*.

## PLANT NOTES.

### PRIMULA RUSBYI.

THE inquiry of an English correspondent concerning the habitat of this new *Primrose* prompts me to send to *Garden and Forest* a note on the beauty of the plant, its discovery and habitat. Early on the morning of May 4, 1881, I had left my camp at the end of a wagon road in one of the cañons of the base of the Santa Rita Mountains of southern Arizona, had mounted successive heights—the grassy slopes covered with a sparse growth of Oaks and *Arbutus*, the breezy ridges crowned with Pines, and the more difficult steep dark with the Douglas Spruce—and was clambering painfully up the long, bare crest of Mount Wrightson, the monarch of that mountain group, when I was reanimated by the exclamations of delight of my young assistant, then a little in advance, over the prettiest flower he had yet seen in Arizona, as he declared. I found it to be a *Primula*. It was much smaller than P. Parryi of the mountains of Colorado, but so nearly answering to the description of that species, that I puzzled over it, as I collected it again and again on those summits, trying to learn if it was really distinct, until Mr. Greene named it and described it from specimens collected by Mr. Rusby in New Mexico in August following. Its habitat is the meagre soil of bare ledges, and the verge and shelves of cliffs of summits of 7000 to 10,000 feet elevation. Its range from the mountains about Clifton, New Mexico, southward along the

Cordilleras certainly as far as 200 miles beyond the boundary. The beauty of this *Primula* must make it a choice addition to the list of plants for rockeries, &c.; and the fact that along the northern limits of its distribution it must be exposed to much freezing, is a guarantee of its hardiness. *Garden and Forest*.

### THE CAPE HOYA (MICROLOMA UMBELLATA).

This pretty little creeper is abundant in some parts of the Cape, where it clothes tall grass and dwarf shrubs with a Dodder-like growth and pretty button-like umbels of rosy-red urn-shaped flowers. The leaves are linear, and the stems are thin and wiry. The flowers are developed from the leaf-axils, and they last several weeks. A plant of this species has been in flower all the summer in one of the houses devoted to Cape plants at Kew. It is planted in a bed of loamy soil, and the shoots are twined naturally about some twiggy branches. Although small, yet this plant is pretty enough to be worth growing for the decoration of the conservatory. Some one has stated that it is hardy in the neighbourhood of London, but a plant tried out-of-doors, in a sunny border at Kew, last year, did not survive the winter. The root is thick and tuberous. W. W.

## THE BULB GARDEN.

### NOTES ON THE LILY SEASON.

As the Lily season is now drawing to a close I send you a note of what it has been with us. The early blooming *Lilies* were very good, we never before had such fine *Lilium Browni* and *L. Hansonii*; *L. Szovitzianum*, *L. geminifolium*, and some *L. longiflorum* bloomed well. *L. candidum simplex* in a few situations was good, but in most the leaves were attacked, became brown, and made no growth. *L. Humboldtii* in sheltered situations was fine, but exposed on the hill went off quite suddenly in a few cold wet days, and all the buds became brown and spoilt. *L. pardalinum* and *L. californicum*, where moderately sheltered, was fine. *L. auratum* in exposed situations in full sun was good and much less affected by the wet weather than most of those which were sheltered from wind. It seems that with our two largest beds of these the one exposed on the hillside is finest in cold damp years, and the other sheltered in the wood, in dry hot years. The varieties, *rubro-vittatum*, *platyphallum* or *platyphyllum*, and *macranthum* have had some very fine flowers, but most had one or two damaged by the drip, or bruised by the unusually heavy rain to which they were exposed.

The finest growths we had were in beds in a wood at Weybridge, here the ordinary *L. auratum* had several stems from 2 to 10½ feet high, and perfect blooms, which showed finely among the trees; but even here, where bad weather has not till this year injured them, a good many were damaged. *L. Martagon dalmaticum* in most situations was good. *L. tigrinum splendens flore-pleno* and *Fortunei* bloomed well; but *L. tigrinum junceum* had its buds injured, as was also the case with *L. Batemanniae*. *L. Leichtlinii* and *L. Parryi* were damaged, and had no good flowers. *L. polyphyllum* was not strong; our finest plant was damaged by the stem being cut to the ground for exhibition last year. *L. giganteum* bloomed well, *L. cordifolium* moderately, *L. superbum* was very fine in some situations, but very bad in others. *L. nigrlanthe* has grown well, but will be too late satisfactorily. The season was a late one, and I feared the varieties of *L. speciosum* (*lancifolium*) could not bloom before the frost came upon them, but the recent hot sun has brought them on fast; those exposed on the hills had their buds damaged by the heavy rain, but in most of the sheltered situations they were little injured, in some not at all, and are now blooming well. *Lilium Kramerii* bloomed well; we had one of the very high coloured varieties; *L. columbianum* and *L. avenaceum* were good. George F. Wilson, Weybridge.

## PLANTING SANDHILLS.

On p. 365 of your last issue, "Doubtful" inquires what trees can be planted on sandhills composed only of sand blown from the sea in the North-west of England. Though the sandhills of the North-west are unknown to me, I have had considerable acquaintance with those thrown up on parts of the coast of Norfolk, and perhaps may therefore be able to impart a little useful information to "Doubtful" and other of your readers who take an interest in the subject.

If the sand shifts its position during high winds, the first thing to be done is to take steps to fix it, and nothing answers this purpose better in the most exposed parts than the planting of roots or tufts of Marram-grass (*Arundo arenaria*). Other good things in the same way, but rather more difficult to obtain in quantity, being *Elymus glaucophyllus* and *E. arenarius*. The roots of these grasses permeate the sand in all directions, and to great depths, holding and binding it together, while those parts of them which grow above ground protect the surface from the wind. No manure is actually necessary to be given towards the support of these plants—Nature provides all that is requisite for their sustenance.

The shifting sands having been specially attended to in the first instance, steps should next be taken towards the establishing of a taller growing vegetation, and for this purpose Furze, Broom, Tamarisks, Escallonias, Japan Euonymuses, Sea Buckthorn, common Elder, Willows of many sorts, Fir trees, such as the Austrian, Corsican, Maritime, and Highland Pine; and inside these Elms, Ash, Thorns, Beech, Birch, and almost any other trees that grow freely in light land may be planted. A good covering for the ground between the trees and shrubs will be found in the common St. John's Wort (*Hypericum calycinum*), and in the Periwinkles.

To establish Furze and Broom, in some instances scattering seed on the ground and roughly scratching it in will suffice; in others planting and immediately afterwards cutting off the tops almost level with the ground; and again in others it may be best to sow seeds in pots—five or six seeds to a small pot—and when grown planting out without breaking the ball of earth; hundreds or even thousands of pots may be prepared at a trifling cost. Escallonias and evergreen Oaks do not transplant freely in the usual way, but by removing a great portion of their tops and planting not much more than their roots success is insured. They may also be turned out of pots with safety, but the expense is much greater. The Japan Euonymus transplants as easily as Privet, to which it is nearly allied; and of this, as well as of Escallonias, it may truly be said that in the British Isles the nearer the sea the better they thrive. Most of these things will be much assisted by applications of manure, and the economical manuring and soiling of sand I purpose treating of later on. Tamarisks, Elders, and Willows thrive under the influence of salt blasts, and may be established in this way.—The plants having been obtained (whether small or large matters little), should have their tops cut off close to the roots and the stump then planted; the tops, then cut into lengths 18 to 24 inches long, should next be inserted in the soil, about two-thirds or three-quarters of their length being beneath, and one-third or one quarter above ground. A large percentage of them will strike root freely as the application of manure will cause vigorous growth. When shelter has been provided by these means and the site of the gardens (if it be desired to form these for the choicer products of horticultural skill), decided upon, the next consideration is the formation of good garden mould; and this, if required to be done quickly, will be a more or less difficult work according to the district. It is by no means necessary to wait till the shelter trees have grown up before commencing to form the garden, provided that all danger of sand being blown over the site determined on has been effectually prevented.

Materials for forming a good garden soil on sand

are, clay (this is indispensable), peat of some kind or other, bog peat being perhaps the best for the purpose, mud from ponds, rivers, &c.; chalk such as frost will pulverise, street and road scrapings, and rotten rubbish of various kinds. Where materials of this kind are difficult to obtain a good soil may be formed (and a permanently good one if small quantities of clay can be occasionally applied to the surface during frosty weather), by sowing grass seeds on the site where the garden is eventually to be, and grazing cattle or sheep on it, feeding them at the same time with oil-cake or other rich foods. Though this plan may take some few years to carry out, it will in most places be much cheaper than the other.

It should be remembered that there is nothing so effectual as clay in correcting the deficiencies of a sandy soil, but that to exert its influence in the highest

FIG. 54.—ADVENTITIOUS BUDS ON PHALÆNOPSIS STUARTIANA.

degree it must be thoroughly pulverised and mixed with the sand, and that nothing pulverises clay like frost, to which, therefore, it should be as much exposed as possible before ploughing or digging it in. Usually it may be obtained and applied during frosty weather most cheaply, and certainly in a manner most likely to be effectual.

With regard to manuring these sandy tracts, there are, of course, many methods; and while some will be best in some districts, others will be best in others. Farmyard, stable, earth-closet, nightsoil, seaweed, fish, and many other "complete" manures (and by complete manures I mean those which contain in easily assimilable form all the essential combinations necessary to add to the poorest soil), may be best accordingly as the facilities for obtaining them exist. Where these natural manures cannot be reasonably obtained, complete artificial manures will suffice; they must contain in proper proportions,

and in suitable combinations, nitrogen, phosphates, potash, and lime, possibly also magnesia. If they are applied in autumn these essentials need not be in so soluble a condition as when applied in spring or during a time of great root-activity. Sand has no power to hold these soluble manurial constituents, and therefore winter rains are apt to wash them down and away from the roots; but when roots are in full activity they would seize on them as the rain carried them in, and the above-ground portions of the plant would quickly show the benefit derived. In many places certain difficulties peculiar to the locality may exist. If any such appear to exist in "Doubtful's" locality, and he would mention them, I would gladly endeavour to point out such ways as seemed to me most desirable to adopt for overcoming them.

A hint as to the fertilisation of maritime sand-hills may be taken from the guano islands, where sea-birds are continually adding their dung to former deposits thereof—their bodies after death also making further additions to the accumulations. Sea-birds, to a greater or less extent, perform the same functions all round the coasts of Britain, but unless there is vegetation to make use of the materials they deposit, these are eventually dissolved and carried away by rain. Where vegetation is present it seizes on these materials by means of its roots, as they become washed into the ground by rain, and it profits immensely thereby. There are many berry-bearing plants which will be found extremely useful in sand-waste planting, and which will help greatly to attract and sustain game. Some of these likely to succeed well are Cotoneaster Simonsi and other Cotoneasters, the common English Blackberry, Privet, and Elder, Berberis of several kinds, the Blackthorn or Sloe, Whitethorn, common Holly and Snowberry; the more animal (query rabbits?) and vegetable life (within reasonable limits) that can be got to thrive together, the more quickly will a rich surface mould be formed from the decay of leaves, twigs, dung, &c. This accumulation of mould will go on to some extent without any aid from human art when once started, but human art may do much to increase the rapidity of the accumulation, and to retain it in a useful condition after production. Though "blowing" and shifting sandhills may be fixed by vegetation, and luxuriant vegetation may be established on these as well as on more level sandy wastes, yet there are a few places of the kind where it might not be advisable to attempt anything of the sort. I know of one long stretch of sandbank on the coast of Norfolk which, if it were once fixed by vegetation, its destruction would in a few years be insured, and disaster to the country now protected by it would inevitably ensue. It is a most interesting spot, and a description of it, the natural causes producing it, and its effect, deserve treatment in a separate article. With hardly an exception, however, I would undertake to cover any sandbank above high-water mark anywhere round the British Isles with more or less luxuriant vegetation in the course of four years or so, if the opportunity were given me; and in some cases I have no doubt but that the produce might be made to pay expenses. J. E. E.

## PHALÆNOPSIS STUARTIANA.

The accompanying sketch (fig. 54) shows the formation of leaf-buds on the inflorescence of this plant subsequent to the fall of the flowers—a fact which will be more gratifying to the amateur than to the nurseryman, as the buds afford a ready means of propagation. Our sketch was taken by Mr. Weathers from a plant in the Royal Gardens, Kew.

**HORTICULTURAL CLUB.**—The first dinner and *conversazione* for the session 1888-1889 of the Horticultural Club will take place at their new rooms, Hotel Windsor, Victoria Street, Westminster, on Tuesday, 9th inst., at 6 p.m. The subject for discussion will be "Peaches," to be opened by Mr. T. Francis Rivers.

## USEFUL INVENTIONS.

The new patent horizontal tubular boiler which is made by the Thames Bank Iron Company is shown in the illustration (fig. 55). The boiler in itself differs in no way from the ordinary type of horizontal tubular boilers, which possess the advantage of requiring but little depth for a stoke-hole, and yield a great amount of surface to be heated by the fire, which is incased by pipes. The great drawback to these boilers, however, is in the joints, which are frequently sources of leakage. In the new boiler of the Thames Bank Iron Company the joints are not caulked—a tedious and troublesome job—but are formed by the compression of rubber rings between the tubes and boiler castings, the soundness of the joint being secured by wrought iron bolts and nuts, which tie the castings together. This form of joint provides for the expansion and contraction of the boiler due to the changes of temperature while in action, and by an inversion of the socket into the waterway of castings the rubber ring is surrounded by water, thus securing the joint from damage. Moreover, in caulking the joints, a considerable time is occupied, but by the new system a boiler may be put together in an hour or two.

Messrs. Gregory & Evans, nurserymen, &c., of Sidcup, have two of these boilers in constant use at their nurseries, where we recently inspected them.

## THE BRITISH FRUIT GROWERS' ASSOCIATION.

On September 8 last, at the conclusion of the Conference of fruit growers in the Crystal Palace, Mr. J. Cheal proposed a resolution to the following effect, namely:—"That it is desirable an Association of fruit growers should be formed for the promotion of profitable fruit cultivation, and to improve the methods of distribution—the Executive Committee of the Conference being requested to prepare a report on the subject, to be submitted to the next meeting at the Crystal Palace, on October 11 this year."

In pursuance of this resolution the Executive Committee met at 5 p.m. on Thursday, September 27, at Anderson's Hotel Fleet Street, T. Francis Rivers, Esq., in the chair, twelve members being present. A draft of the Association was then read, considered at some length, and finally adopted.

The adjourned Conference will be resumed at 2 p.m. on Thursday, October 11, at the Crystal Palace.

The following is the draft adopted at the above meeting, and all desirous of joining the Association should communicate with the Hon. Secretaries, Mr. Lewis Castle, Hotham House, Merton, Surrey; or Mr. William Earley, Ilford Essex:—

The title will be, "The British Fruit Growers' Association."

**Objects.**—To promote the profitable culture and the improvement of fruit in the United Kingdom, and to facilitate the distribution to consumers.

**Methods.**—It is proposed to effect these objects by the means of meetings and conferences in the metropolis and the provinces; the collection from all districts of reliable information bearing on the subjects, its dissemination through the daily and horticultural Press; by the publication of annual reports, with such others of a special character as the funds of the Association may permit; and by securing the adherence of local societies to the object of the Association.

**Membership.**—A subscription of not less than 5s. annually shall entitle any person duly elected to membership of the Association, including admission to all conferences and general meetings, one copy of each publication issued by the Association, and such further privileges as may be subsequently determined. First subscriptions to be paid at the date of joining, and subsequently annually on January 1.

**Officers.**—The officers of the Association shall com-

prise a President, two Vice-Presidents, a Treasurer, and two Honorary Secretaries.

**Committees.**—The business of the Association shall be conducted by the officers, a General Committee of forty members, an Executive Committee of fifteen members, five to form a quorum, and special sub-committees to be elected by the latter, the officers being *ex-officio* members of all committees.

**Election of Members, Officers, and Committees.**—Proposed members of the Association to be nominated by two members, and elected at any meeting. The officers to be elected annually. Ten members of the General Committee to retire annually, but to be eligible for re-election; the retiring members in the first two years to be decided by ballot, and subsequently in the order of election. Nominees for the committee to be proposed and seconded by two members of the Association at the annual general meeting. All elections to be effected by open voting. The Executive Committee to be elected by the General Committee from amongst themselves after the business at the annual meeting.

**Meetings.**—The annual general meeting shall be held in December of each year to receive the report of the General Committee, for the election of officers, committees, and the transaction of any other important business.

The General Committee shall hold at least two meetings, and the Executive Committee shall meet as often as necessary, in each year. The Executive Committee to decide the dates and place for all meetings and conferences.

## ORCHID NOTES AND GLEANINGS.

## ANGULOAS.

These plants, although not amongst the most graceful of Orchids, are, when in flower, some of the most striking—few at that time attracting more notice. They adapt themselves freely to cultivation, and on this account may be recommended to beginners in Orchid cultivation, and to those who have no houses set apart for them. In most of the species the pseudo-bulbs are very large. We have found those of *A. Clowesii* measuring 8 inches high by about 3 inches across, bearing from the top three or four broad, stout leaves 2 feet in length. The flowers are large and cup-shaped, with thick, fleshy sepals and petals; they are usually borne singly on erect scapes a foot high, frequently, however, on vigorous plants we have had twin-flowered scapes. The scapes are produced from the base of the young growths, sometimes as many as six being clustered round one growth.

Anguloas are best grown in pots, or if the specimens be large, in moderately deep pans, which should be filled to one-third their depth with drainage. The compost should consist of equal parts of peat and loam, from which the earthy particles have been shaken, with a small addition of chopped sphagnum and silver-sand. It is well to build up the compost, so that the bases of the pseudo-bulbs are above the rim of the pot, for although the plants must have abundance of water when growing, the very young growths with the embryo flower-scapes they enclose are liable to damp off if the water lodges about them. Being gross feeders, these Orchids are much benefited by occasional waterings with weak manure-water, and we also have found that the vigour of the plants is enhanced by giving the soil a sprinkling of fish manure about three times during the summer. Repotting should be done in spring, when any loose or sour soil should be picked or syringed off, and a good shift given. They may be grown at the cool end of the Cattleya-house, or in the cool-house. *A. Clowesii* is the best known species, and one of the freest growing. It has tulip-like flowers, measuring 2½ inches across, with bright golden-yellow sepals and petals, and a white lip; the lip is hinged, and as the flower is moved rocks to and fro. The flowers give off an odour resembling that of paeonies.

*A. Rackeri* resembles the above in the shape of

its flowers, which have sepals and petals with a yellow ground colour thickly blotched with crimson; the lip is deep crimson. The variety *sanguinea*, which is flowering now at Kew, is very rare; it has flowers of a deep blood-red colour.

*A. uniflora* is a free-blooming species with white flowers tinged with pink on the inner side. Like the two preceding species it is a native of Columbia, and flowers in July and August. There are a few other species and hybrids in cultivation, but they are rare, and not easily attainable.

#### SACCOLABUM CELESTE.

This species, one of the latest acquisitions in Saccolabiums, has recently been flowering in several establishments near London. It is a beautiful little Orchid, similar in habit to *S. miniatum*, with erect, densely-flowered racemes, 3 to 4 inches high. A distinct character is given to the species by the colour of the flowers, of which the tips of the sepals and petals and the front portion of the lip are sky-blue—one of the rarest colours to be seen in Orchids; the rest of the flower is white. The plants should be grown in sphagnum, the baskets being suspended from the roof in the warm house. Free supplies of water are necessary in summer, with much less in winter; at no time, however, should they be allowed to become quite dry at the root. *W. B.*

## HOME CORRESPONDENCE.

**SHELTER FOR ORCHARDS.**—In common with most of readers I have read with great interest your report of, and the papers read at, the Fruit

FIG. 55.—NEW HORIZONTAL TUBULAR BOILER. (SEE P. 390.)

Conference held at the Crystal Palace lately. Excellent instruction was offered to intending growers, but one important thing was lost sight of—not one of the gentlemen once alluded to the subject of shelter for orchards. Now to my mind this is a serious omission. In some place Nature provides this by hills, or man has done so perchance by woods, and the growers of fruits are successful, never dreaming that half the success is due to situation. When a young man I grew Peaches in the valley of the Thames, on the open walls, as large as my fist (not a small one) and exhibited them successfully; but in later years I discovered that the same could not be done in some places without a good deal of shelter, either by planting trees or employing glass structures. Again, Apple or Pear trees may grow on well in an orchard during the summer if the season be genial, but just when the crop is nearly ready for gathering there comes a violent gale of wind, and if the orchard is not well sheltered half the crop is blown down; and the lamentable part is that it is always the finest fruit which fall. No longer ago than last week a gentleman told me at the Brighton show that last year he had half his fruit blown down and consequently spoiled; for, remember, with some few exceptions, the longer fruit can be left on the tree the longer it will keep. Some twenty years ago Apples were very scarce in this country, but I heard of an orchard not far from here, where there were plenty for sale. How can this be? was the question one naturally asked oneself—there is some good reason for this; and sure enough, I found the trees surrounded by a belt of Pine trees. This had protected the blossom in the spring, and again in the autumn; and so satisfied was I of this that before a month had passed a plantation of Scotch and Austrian Pines was made around our orchard and with the best possible results since. I

often observe in the cold nights of autumn the cattle and even the sheep find shelter in my plantation, the trees composing it being now 30 feet high. These remarks on shelter apply to fruit trees as dwarfs and cordons, as well as to standards, for an equinoctial gale will blow down much of the finest fruit on any kind of trees unless these are protected. *J. Rust, Eridge Castle.*

**BEDDING PELARGONIUM REV. F. M. ATKINSON.**—One of the most popular of bedding Pelargoniums, perhaps the most popular, is *Henri Jacoby*, a deep crimson, or almost maroon coloured variety. But it is not a good dull weather colour; and therefore I prefer the one which heads this paragraph, because the flowers are of a very bright and effective shade of crimson and it is also a good green—quite equal to the other, and remarkably free too. Calling the other day upon a gardener who grows bedding Pelargoniums, he stated he should for the future discard *Henri Jacoby*, and use the *Rev. F. M. Atkinson* in its place. *R. D.*

**THE HARPALIUM RIGIDUM SEMI-PLENUM OF THE ROYAL HORTICULTURAL SOCIETY'S FLORAL COMMITTEE.**—On p. 364 of the *Gardeners' Chronicle* I read that a First-class Certificate was granted at the meeting of September 25 to Mr. Ware for *Harpallium rigidum semi-plenum*. I have a few remarks to make, about this plant and its certificate. In the first place the generic name *Harpallium*, authorised by De Candolle, is disallowed by Bentham and Hooker in their *Genera Plantarum*, and is not admitted by *Asa Gray* in his *Flora of North America*, and the genus *Harpallium* has been restored to *Helianthus*; so I think it fair to protest against this sanction given by the Royal Horticultural Society's Floral Committee to an

few and slight; the leading distinctive character, as given by *Asa Gray* at the head of the species is, that when the florets of the disc are fully expanded, the prevailing colour of the disc in *H. latiflorus* is yellow, whilst that of *H. rigidus* is black, and this difference is conspicuous at a glance. Anyhow, as these have been made separate species we had better follow the most recent authority in the arrangement of the genus. Perhaps the semi-doubleness of our English stock may be accidental, and not essential to the species. *C. Wolley Dod.*

**A CURIOUS PELARGONIUM SPORT.**—A vigorous growing double zonal Pelargonium bearing bold trusses of violet-crimson flowers, has, in one of the plant-houses at Hanger Hill House, Ealing, thrown a very strong growing sport of the nosegay type, having very large, and somewhat starry cerise coloured blossoms. It is like going back to a progenitor the onward march of the species had left hopelessly in the rear. But who is equal to interpreting the rationale of a transformation? Really, Mother Nature plays some curious pranks occasionally! *R. D.*

**OLD FAVOURITES UNDER NEW NAMES.**—It is frequent cause of annoyance to gardeners when, having procured some plant under a new name and watched its progress toward maturity, it turns out an old well-known variety. This is trying and vexatious where annuals are concerned, but it is much worse with orchard trees. Two or three years ago a correspondent in your paper strongly recommended an Apple of French origin named after the raiser at Amiens, "*Jacques Lebel*." With some difficulty I procured two trees, which are now in fruit. The Apple proves to be identical in leaf, growth, and fruit, with *Bramley's Seedling*. I send you an Apple of each for inspection. If it were the fruit alone which resembled each other, there might be a mistake. The growth and habit of trees is as useful in identifying varieties as the fruit itself, and all these are unmistakably the same. If *Jacques Lebel* be an old French Apple, I can only suppose that some nurseryman has seen its splendid growth, and given it an English name; for, whatever be its source, the Apple is one of the best in cultivation. *James Ellis, The Gynsills, Leicester.* [You must have had sent you *Bramley's Seedling*, as *Jacques Lebel* is a different thing. The latter was distributed by *André Leroy* in 1849, it having been raised by a nurseryman of that name at Amiens. *Bramley's Seedling* is of more recent origin. *Ed.*]

**THE JAPANESE ANEMONES.**—It seems impossible to praise these too highly in respect of their value as autumn-flowering plants in the open. Some beds of the old type, and the white and rose-coloured varieties to be seen at the Royal Nursery, Slough, are masses of bloom, and thousands of flowers can be cut from them. It seems to do well in a sunless as in a sunny spot, but it does a great deal better in the latter. When planted, it requires a year to establish itself, and then when it begins to grow it does so with great freedom, and multiplies with wonderful rapidity; any small piece of root appears to make a plant, and the plants put forth running rootlets, and so increases itself rapidly. It is, perhaps, somewhat singular, seeing that it bears seed, that no addition has been made to the varieties by means of seedlings. *R. D.*

**THE HYPOCAUST GARDEN.**—I find I expressed myself rather vaguely, in my short paragraph on this subject last week, I desired to convey the fact of the quick ripening of the Pine-apple even in such a season as we have had this year. It was in fact ripe ten days before I sent it to you. I should feel greatly indebted if you would give your opinion as to the flavour, *pro bono publico*, I think *Kingsley*, who made some experiments in this direction a few years since, found the quality of Peaches, &c., very good. I may add that some *Pleione*s thrive in the warm earth and are now throwing up their flower-stems. *R. T. C.* [As we stated last week the juice was abundant and the flavour excellent, better than in many stove pines we have tasted. *Ed.*]

**ANNUAL CHRYSANTHEMUMS.**—Calling at *Gunnery Park, Acton*, a few weeks ago, I was much struck with the beauty of some beds of annual Chrysanthemums that Mr. Roberts had planted out. Their profusion of bloom and brilliance of colouring is something remarkable. It is nearly a century ago that *Chrysanthemum carinatum*, or more popularly known as *tricolor*, came to us

obscure name. In the next place, as regards the plant itself, I received after the meeting a letter from a distinguished member of the Floral Committee asking me to give him roots of the plant which had been certificated, which he was told came from my garden. I replied that I was in doubt about the identity of the plant. I have a semi-double variety of *Helianthus rigidus*, which I have given to several friends, but this could hardly be in certificating condition as late as September 25. My correspondent then told me that the flower was labelled "*Harpallium latiflorus* of Mr. Wolley Dod." This is a gross libel on my naming, and I am sure I never called a plant so far "out of its name," but it gave me a clue to the truth as I did give Mr. Ware *Helianthus latiflorus*, and I have no doubt that the certificated plant is *Helianthus latiflorus* (Persoon) of *Asa Gray's Flora of North America*, vol. ii., p. 275. The history of this plant is as follows:—It was given to me by Mr. W. Thompson, of Ipswich, about six or seven years ago as *H. doronicoides*. This I soon saw it could not be, but thought it then a late semi-double form of *H. rigidus*. Two years after I saw the same plant at Kew labelled *H. latiflorus*, the Curator of the herbaceous garden there, assuring me that the name was certainly right. Having this clue I carefully went through Dr. Gray's description, and concluded that the plant is *H. latiflorus*, and nothing else, and I wrote to Mr. W. Thompson, informing him, of this—though he was not convinced. In the course of Dr. *Asa Gray's* last visit to England, two or three years ago, he went to Mr. Thompson's nursery, and on being shown this *Sunflower*, at once recognised it as his *H. latiflorus*. We have thus the very best authority for establishing the name. I must say that, as regards habit and leaf and flower, the differences which separate it from *H. rigidus* are

from Barbary. It was no doubt much inferior to the fine type grown in the present day, which is represented by a large white Daisy-like flower, having a yellow ring round a dark disc. The dark disc is a leading feature in all the varieties of *C. carinatum*; it is like the human eye, giving life and expression to the blossom. In Burridge's *Chrysanthemum* (C. Barridgeanum) we get still a slight yellowing round the disc; but added thereto and farther from the centre, is a zone of bright crimson—a charming variety. In the Sultan and *atro-coccineum* we get two varieties, one with a broad margin of maroon crimson, and the other of orange-crimson, stretching away in each case from the zone of yellow round the dark disc to the petal edge—both very showy and striking, but varying from seed. Lord Beaconsfield is in the same way, but with the margin striped with gold, and a slight edging of the same. W. E. Gladstone has a margin of crimson and violet, but the seed progeny varies greatly in character. One variety has an entirely gold margin to the dark disc, while another, named *venustum* has the usual golden ring round the disc, then a very slight one of red-dish-purple, and the margin mottled white and pale rosy-purple. One particularly striking variety is very large, with abroad pale crimson zone filling up pretty well half the space between the disc and the petal edge, the remainder buff, slightly will come true tinted with orange. The typical variety, *carinatum*, comes true from seeds, and any one of the others is certain to give a variable progeny. If a packet of seeds of newest varieties in mixture, be sown, and the plants put out in a bed of good soil, wide enough to allow ample room for the plants to develop, they would afford a striking mass, surprising on account both of their beauty and variety. The richer the ground, and the larger the space afforded each plant, the finer will be the individual flowers, and the more brilliant the colours. And these annual *Chrysanthemums* are remarkably persistent bloomers: Mr. Roberts cuts hundreds of blossoms from his beds, which, by the way, are greatly esteemed for house decoration, while they go on flowering freely from strong growths. There is every prospect they will go on furnishing an abundance of flowers until the autumnal frosts lay the plants low. R. D.

**DAHLIAS CHANGING COLOUR.**—Let me assure "Old Subscriber" that there must be a mistake somewhere about his Dahlias changing colour as he describes it. Either the roots or cuttings got mixed by accident, or by some mischievous person. I have grown and flowered Dahlias by the ten thousand for many years here at Woking, but never found them to vary like that unless propagated by seed, from which latter, as is well known, you get pretty nearly as many varieties as plants. However, amongst five thousand seedlings from good roots, which I raised one year, I only got one which was an improvement. They generally all turn out inferior to the parent. I had better luck with sports, as, for instance, a few years ago, I noticed on one of my Dahlia *Juarez* a flower which was streaked with orange-scarlet. By singling it out and propagating it by itself I succeeded in time in getting a plant which produced nothing but orange-scarlet flowers, while retaining all the shape and characteristic growth of the parent. It proved constant, and I disposed of the stock of it to Mr. Thomas Ware, of Tottenham, who I see is showing it this season as *Cactus Dahlia Professor Baldwin*. I believe it to be the only other real *Cactus Dahlia* besides *D. Juarez*. I may add that I am at the present time following up another sport of the same variety, which produces flowers of a beautiful purple colour; but I have not succeeded in fixing it as yet. *Gustav Wernig, Woking.*

**THE ONION SEED CROP.**—It would appear that the prospects of the seed harvest from Onions are worse in this country than they have been for many years, and that mainly owing to a cold and wet July. The Onion, in England, is generally in full bloom in July, and towards the end of August the seed is expected to be black, which is the sign of ripeness. This year the middle of August was reached before the Onions were well in bloom, and then only in the case of isolated heads. It was not until the beginning of September that the crop was well in flower, and the seed matures so slowly that there is reason to fear it will be in many places a complete failure, as, at this late period, it cannot possibly come to perfection, and the only seeds that show signs of maturing are those at the top of the inflorescence, instead of all round it, in the form of

a perfect ball. It is those who planted early in the season, on quick, warm lands, that are likely to secure anything of a crop. In the case of those who plant out the largest and handsomest bulbs to secure fine seed, and which require more time to come to maturity, the outlook is gloomy in the extreme, and what little seed may happen to ripen will be light and poor, notwithstanding the plants have been cared for in every possible way. The Bedfordshire growers of Onion seed are suffering also; one of them, in the neighbourhood of St. Neot's, estimates his loss at £600. R. D.

**THE CAPTAIN STRAWBERRY.**—This variety was put into commerce as one fruiting both in the spring and autumn. This it appears to do, for the strong runners of this year are seen to be putting forth trusses of bloom. At Gunnersbury Park Mr. Roberts has lifted a good number, potted them, and placed them in a heated frame, in the hope that they will give him a few dishes of fruit at mid-winter. D.

## SOCIETIES.

### ENGLISH ARBORICULTURAL.

The fourth annual excursion of the members of the above Society took place on Friday week, the place selected being the Chillingham estate, permission having been kindly granted by the Right Hon. the Earl of Tankerville. Most of the members journeyed to Wooler on the Thursday evening via the new line. On Friday morning many of the members were astir and had a ramble through the village and adjoining neighbourhood. The route to Chillingham by West Woodfoot, Fowberry Tower, Chatton, and Chillingham Barns, was an exceedingly fine one, the country on each hand being well wooded and picturesque. On arriving at Chillingham the company was met by Mr. Noble, the land steward, and Mr. Henderson, the gardener, who gave them a very cordial welcome. Mr. Noble then acted as cicerone to the party, and first conducted them to the parish church. Near the church is the pleasantly situated vicarage, and here dwells the Rev. Joseph Hudson, a former vicar of Hexham, and who, though in his ninety-seventh year, is still hale and hearty, and, in fact, accompanied his choir to Warkworth on the Monday previous.

After inspecting the Castle and its interesting pictures, the gardens, and the wild cattle in the park, luncheon was partaken of under the shadow of Rass Hill, and afterwards the majority of those present ascended it. It is 1200 feet above the level of the sea, and the view to be obtained from it is extensive. The whole of the park was visible, and the wild cattle were distinctly seen. There is a Saxon camp at the top of the hill. Just adjoining the camp there is a strip of natural wood, consisting of Alder, Birch, and Oaks, and it is supposed to be part of the old Caledonian forest. Descending the hill and again entering the park Hebburn Castle was visited. This was formerly a "peel" of the better class belonging to the family to whom it gave a name. It is of the usual peel type—square and massive, and is a fine specimen of an old border peel.

Leaving this interesting relic, the party journeyed across the park and entered the Axes Wood, and in it a nice plant of *Abies nobilis glauca* was measured, and noted as having grown 18 inches in 1887, and 30 inches in 1888. *Abies Douglasii*, *Wellingtonia*, and *Picea* were growing near, and doing very well. Passing through a thicket of self-sown Oaks, supposed to be 200 years old, attention was fixed by Mr. Noble on a grand tree of *Abies grandis*, 40 feet high, and 4 feet 2 inches in girth 6 feet from the ground. Balm of Gilead Silver Fir was also doing very well, and several grand trees were measured to 45 feet high. Entering The Dell, the next tree measured was a splendid specimen of *Wellingtonia gigantea*, 55 feet high, 7 feet 3 inches at 4 feet up, and 10 feet 6 inches girth at the bole. Two seeds of this giant tree were sent to the Vicar and given to Lord Tankerville, and two trees were raised and nursed in the greenhouses thirty-five years ago, and both are living, the one under notice being one. The English Oaks in the front of the castle, called the Beggar's, the King's, and the Quirches, were raised from Acorns got from the late Lord Bagot. Passing through the alpine garden a Spanish Chestnut was measured, 14 feet 3 inches 4 feet up. Amongst a clump of hybrid *Rhododendrons* a few spikes of a grand *Lilium giganteum*, which this season yielded sixteen or

seventeen flowers on each spike, were most conspicuous. Passing through King James' Gate to My Lady's Plantation an enormous Silver Fir was measured; it is 120 feet high, and 11 feet 2 inches in girth up, with a clear bole of 90 feet. This is not quite so large as the famous Silver Fir at Basington, the seat of the Earl of Ravensworth, which measures 134 feet high, and is 15 feet 6 inches 5 feet up, and is said to be 170 years old, and pronounced to be the largest tree in Northumberland. Going through the Horse Pasture the company came across a curious old Oak, measuring 24 feet 6 feet up, and altogether a curiosity. Several other Oaks and Elms were measured of enormous size.

At the dinner held at the Wooler Cottage Hotel, the Chairman, Mr. Isaac Batty, Hexham, in proposing "Success to the English Arboricultural Society," said, when that excursion was first talked about he questioned the wisdom of going to Chillingham, but among the many excellent excursions they had had during the four years the Society had been in existence none had been so pleasant, and none so enjoyable as that one, and none had been more interesting than they had had that day. Though there had been little of arboriculture in the strict sense of the term, yet they had all the opportunity of enjoying themselves according to their peculiar bent. At the earliest stage of their proceedings he had had the pleasure of meeting one with whom he was associated in his earliest infancy and boyhood, the Rev. Joseph Hudson, the old Vicar of Hexham, who now administered the affairs of Chillingham parish, and who, at his great age (97), was still hale and hearty. Then they had viewed the architecture and heard the historic associations of the old church.

He also said, in the course of his remarks, that while it was very pleasant to have these annual *réunions*, they should not forget that their members were the backbone of arboriculture in the North of England. Their Society was proceeding along quietly and soundly, but he thought it might go a little quicker. He thought if each of them were to send to Mr. Davidson two new members during the next week it would help Mr. Davidson very much. He thought they did not co-operate with Mr. Davidson as much as they might do. They should all back him up and get as many members as possible. We may mention that after dinner Jacob Wilson, Esq., of Chillingham Barns, was elected a honorary member of the Society.

## Obituary

**F. ARTHUR DICKSON.**—The news of the death of Mr. Francis Arthur Dickson, of Chester, on the 27th ult., will come as a shock to a large body of friends and acquaintances; indeed, his name was so well known, and both he and his establishment held in such high repute, that the feeling of regret at his loss will be general among horticulturists. It is only the other day that we mentioned the amalgamation of the two renowned Chester firms, now known as Dicksons, and alluded to the valuation of the stock as a matter of interest from its extent and value. In 1870 he was elected to the dignity of Mayor of Chester. The birth of one of his children took place during his year of Mayoralty, and he was presented with a silver cradle, subscribed for by fellow-citizens and friends, the presentation being made by His Grace the Duke of Westminster in the Town Hall. On January 6, 1871, he was placed on the Commission of the Peace for the city. He took an active interest in all matters pertaining to agriculture and the various agricultural bodies in Cheshire and adjoining counties, but more particularly in his native city; so much so, that in 1873, on the occasion of the visit of the Royal Manchester, Liverpool and North Lancashire Agricultural Society to Chester, he was presented with an address by his colleagues and others for his distinguished services on the local committee.

Deceased was the son of the late Mr. Francis Dickson, who was one of the founders of the original firm with which his name was connected, and was for a great number of years associated with his father in the conduct and maintenance of the business, taking a prominent share of the labour in it until some five or six years ago. A severe illness then necessitated his going abroad, and he had in conse-

quence to retire from all active participation in the work of the firm. Subsequently, about eighteen months since, however, Mr. Dickson's health seemed so far improved, that he took in hand the direction of the nursery department and the supervision of the business generally; but, finding that increased exertion brought on a relapse of his old malady, and acting under medical advice, he retired completely from active work in the affairs of the concern, and took up his residence at West Kirby. But during the last few months the hidden germs of disease of a cancerous nature, from which the deceased gentleman suffered, made themselves very manifest, and he gradually grew worse during the last few weeks of his life, enduring intense suffering.

Mr. F. A. Dickson, as we have already intimated, was a prominent member of the newly amalgamated firm of "Dicksons, Limited," and his family will retain his share in the business, their interests being left in the hands of his executors; he also was a strong supporter of the Gardeners' Royal Benevolent Institution. He leaves a widow and five sons and four daughters to mourn their loss. He was in the sixty-second year of his age. The Union Jack at the Chester Town Hall was hoisted half-mast as soon as the death of the respected alderman became known on Thursday morning.

**DAVID WOOSTER.**—At Bayswater, after an illness of over three years, David Wooster, in the sixty-fourth year of his age. Comparatively few, we expect, will recognise in this announcement the loss of one who formerly was a very active worker in and for horticulture. In early life he was in the employ of Loudon, and aided that laborious man in the editing and compilation of many of his careful and useful publications. To the end of his life Mr. Wooster revered the memory of his old employer, and he showed his reverence by planting a memorial tree in Hyde Park, nearly opposite the street where Loudon worked. It was to his initiative and to his exertions mainly that the portrait of Loudon by Linnell was secured for the Linnean Society of London. Linnell had been a friend and neighbour of Loudon's, whose portrait he had painted in bygone years, and on learning the purpose for which the portrait was required the artist disposed of it for an amount very much below what so good a portrait by so famous an artist would have obtained in the ordinary way. It was, however, characteristic of the painter that he declined to receive a cheque for the amount, and that even the offer of bank notes by Mr. Wooster in person was objected to, and solid coin of the realm alone was considered adequate. Wooster subsequently became associated—in what precise capacity we do not know—with the late Sir Walter Trevelyan, a man of much learning and varied tastes, with a strong bias towards natural history and art. In such circumstances Wooster was in his element; the library, the gardens, the woods at Wallington all furnished him with materials for observation and study. Apart, however, from the work he did for Loudon, Wooster did not publish much beyond a work on Alpine plants, to the coloured illustrations of which he contributed the text. Mr. Wooster took great interest in the Royal Horticultural Society, and up to the time of his illness watched its progress with anxious heed. He was also an occasional contributor to the columns of this journal, while his extensive knowledge and gentle manners make one feel that we could have better spared a greater man.

## THE WEATHER.

### THE PAST WEEK.

The following summary record of the weather for the week ending Oct. 1, is furnished from the Meteorological Office:—

"The weather was generally fair and dry during the earlier part of the period, but subsequently became unsettled, with occasional falls of rain. At many of our northern stations sleet or snow showers occurred towards the end of the week.

"The temperature has been below the mean in all districts. Over Ireland and the south and south-west of England the deficit has been slight, but over Scotland and the northern parts of England a deficit of 4°–6° is shown. The highest of the maxima were generally recorded on the 27th, when the thermometer rose to between 58° and 64° in Scotland, 65° and 69° in Ireland, and 62° and 70° in England. The lowest of the minima, which were registered on the last day of the period, ranged from 26° in 'Scotland, N.,' and 28° in 'Scotland, E.,' and the 'Midland Counties,' to 35° in 'Ireland, S.,' and 39° in the 'Channel Islands.' At all the more central stations sharp ground frost was experienced.

"The rainfall has been less than the mean in all districts excepting the 'Channel Islands.'

"Bright sunshine has been less prevalent than of late, especially in the north-eastern parts of the kingdom. The percentage of the possible amount of duration ranged from 11 in 'Scotland, E.,' and 13 in 'England, N.E.,' to 30 in 'Scotland, N.,' and the 'Midland Counties,' to 34 in 'England, N.W.,' and to 40 in 'England, E.'"

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees.—A "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## NOTICES TO CORRESPONDENTS.

**ACORN IN WATER: E. C. C. D.** The best way is to gather fresh Acorns, germinate them in damp sand, afterwards washing off carefully all sand from the roots; then fasten wire through or round the Acorn, and suspend it just above the water in a long glass jar. Some means should be adopted to keep dust and dirt out of the water, and the jar should be placed in a light airy spot clear of frost. When the Acorn is not first germinated, but simply suspended close to the water, it often remains months without starting, and sometimes rots away.

**BOOKS: E. A. K.** *The Carnation and Picotee*, by E. S. Dodwell. London: Groombridge & Sons, Paternoster Row, price 6d.—*Cincinnati. Epitome of Gardening* (Black & Son).

**DIGITALIS FERRUGINEA: G. S.** Many thanks. The central axis of the flower, instead of producing pistils and seed-vessels, is prolonged into a short stalk, surmounted by an abortive flower.

**ECCHARIS: T. H.** Your flower with ten segments and ten stamens is due to the blending at a very early stage of two flowers into one, as may be seen by examining the flower-stalk by the aid of the microscope. The condition is not uncommon, but it is a pure accident.

**FUNGUS: M. Y.** The fungus sent is one of the Starry Puffballs (*Geaster Bryantii*). You will see it described and illustrated in the *Gardeners' Chronicle* for 1873, p. 504. All the British Starry Puffballs are figured in the 1873 volume.

**GERANIUM LEAVES: H. T.** The *Pelargonium* leaves you send have been either frost-bitten or burnt by the sun shining through drops of water.

**COVENT GARDEN MEASURES: Cincinnati.** Of Turnips and Carrots, twelve and upwards, according to size, make a bunch. Of Leeks, six or more. A roll of Celery contains six, eight, to twelve heads. A list of various measures in use in Covent Garden will be found on our Almanac issued with the number for January 7 this year.

**NAMES OF FRUIT: H. Taylor.** 1, Worcester Pearmain; 2, Brabant Bellebeur; 4, Cellini.—*W. Beswick*, 1, Maréchal de la Cour; 2, Bergamotte d'Espéren; 3, Gilgoli? 4, not known; 5, Bishop's Thumb; 6, Fondante d'Automne.—*G. Franks*, 1, Clapp's Favourite; 2 and 5, Williams' Bon Chrétien; 3, Beuré d'Amanlis; 4, Hacon's Incomparable; 6, Comte de Flandres.—*M. L.* Not known: worthless.—*John Prince*, 1, Lord Derby; 2, Alfriston; 3, Royal Russet; 4, Lord Grosvenor.—*W. H. K.* Your Grape is Madresfield Court.

**NAMES OF PLANTS: T. C.** *Diplacus gintoniosus*.—*W. A. S.* *Platanus acerifolia*.—*Septic*. *Spiranthes autumnalis*, *alias* *Neottia*.—*J. F.* *Cotoneaster frigida*.—*W. O. C.* *Melilotus officinalis*.—*A. L.* 1, *Physostegia imbricata*; 2, *Veronica spicata*; 3, *V. incana*; 4, *Scabiosa columbaria*; 5, *Galega officinalis*; 6, *Campanula rapunculoides*.—*L. C. H.* 1, *Asplenium trichomanes*; 2, *Polypodium vulgare*; 3, *P. Billardieri*; 4, no specimen; 5, *Vaccinium myrtillus*.—*E. C. C. D.* *Digitalis ferruginea*.—*Mary C.* *Scirpus prolifer*.—*Doubtful*, 1 and 2, *Centaurea Tournefortii*; 3, *C. calceopala*, var.; 4, *Sedum rupestre*; 5, *Saxifraga aizoon*; 6, *Semprevivum*, we cannot name without flowers.—*C. Volley Dod.* *Clematis recta*.—*A. B. D.* Next week.—*Bresse*. *Sisymbrium Sophia*.—No name (some tickets loose). 1, *Crococoma aurea*; 2, *Pteris argyrea*; 3, *Anthericum lineare variegatum*; 4, *Pasiflora racemosa*, princeps of gardens; 5, *Selaginella Mertensii*; 6, *Begonia metallica*; *Nephrodium molle cristatum*; *Cypripedium Spiciferum*.

**RASPBERRIES FOR FIELD CULTURE: J. H. B.** Of older varieties, Baumforth's Seedling, Northumberland Fillbasket, and Fastolf, reds; and the Yellow Antwerp. Merveille des Quatre Saisons, or October Red, and the October Yellow, are good

**SHIRLEY POPPIES** (the genuine strain).
